

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

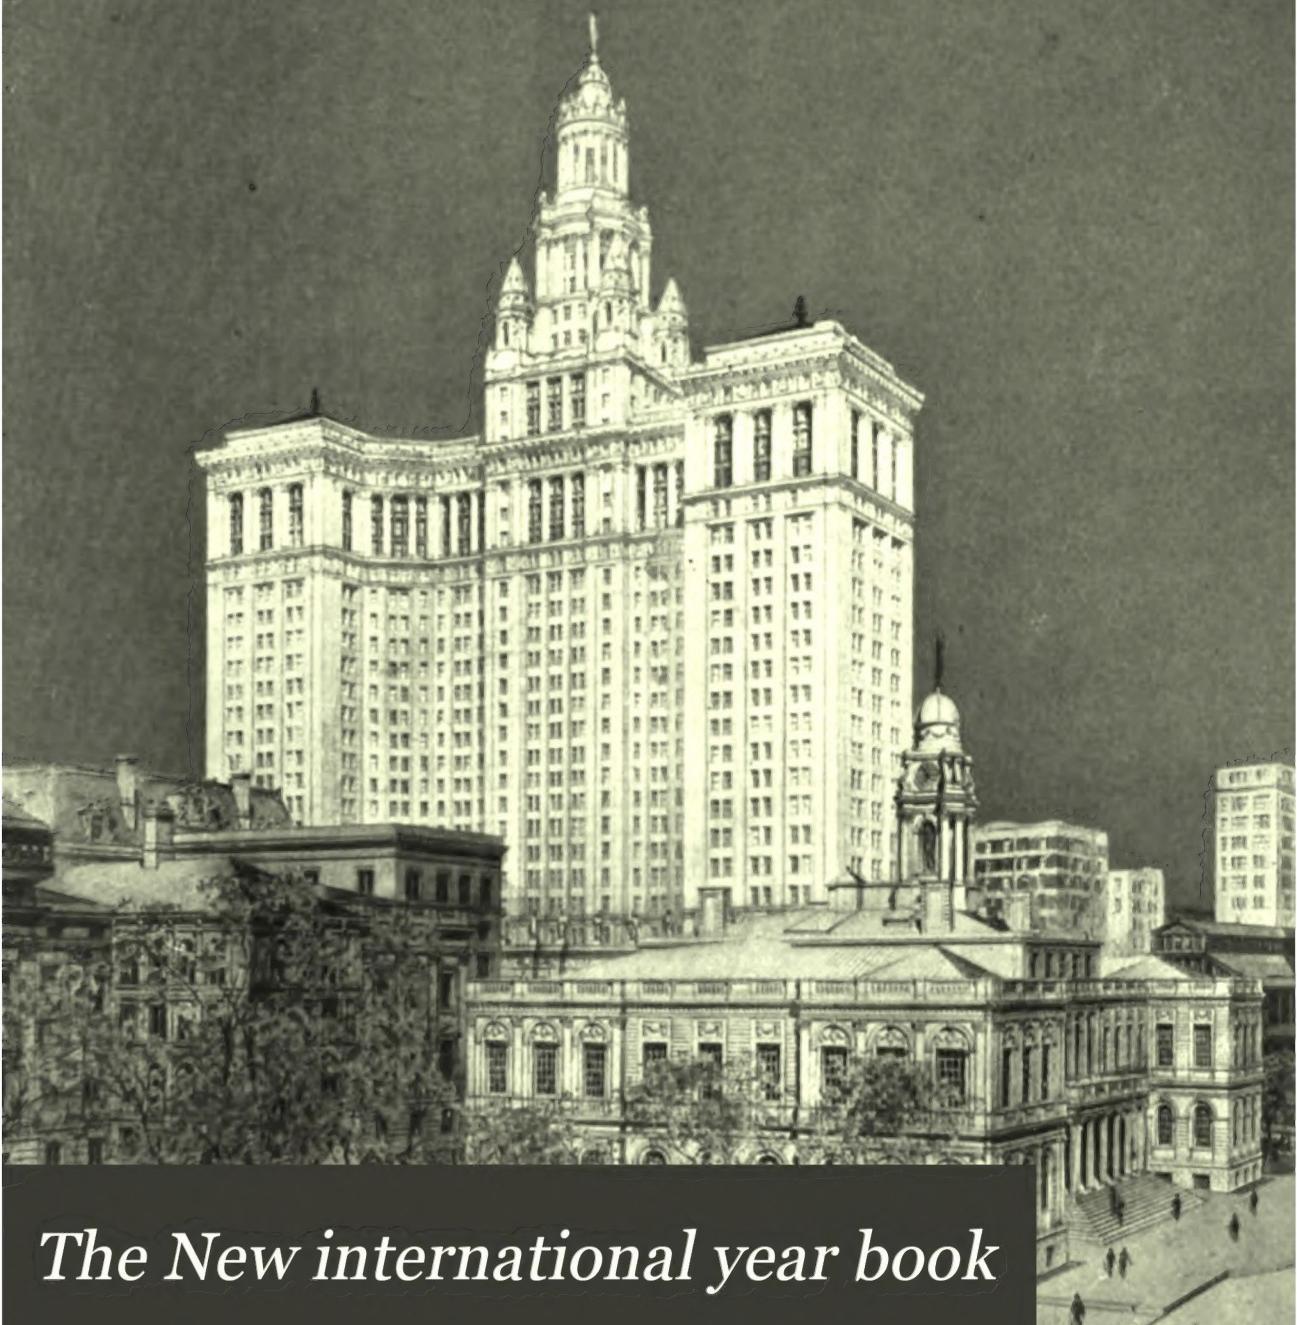

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE

The NEW INTERNATIONAL YEAR Book for 1909, like its two predecessors, the volumes for 1907 and 1908, is designed to serve as an encyclopædia of the year, placing on record, so far as possible within the limits of a single volume, the leading features

SCOPE OF THE YEAR BOOK of the year's activities in every field. It is not a specialist's handbook, but a general work of reference. Each of the departments, however, is prepared by a specialist and no pains have been spared

to insure accuracy and the selection of the most important topics.

No other volume aiming at this degree of comprehensiveness is published in English. There are, of course, many annual publications dealing with special subjects, and there are, in the more general field, a number of almanacs, statistical handbooks, summaries and abstracts, but none of these attempts an encyclopædia survey of the year. The nearest approach to an annual encyclopædia is that excellent English publication, *Hazell's Annual*, but in this the comparatively wide range of topics is secured only by carrying the condensation of discussion almost to the vanishing point; and the space at its disposal does not admit any adequate record of progress in the arts, science and literature, or any full presentation of the year's statistics, to say nothing of the disadvantage, from the American point of view, of surveying the United States through the wrong end of the telescope.

Apart from the present volume there is in this country no work of reference that approaches the scope even of *Hazell's Annual*; there is no annual record of current history; there is no compilation of statistics at all comparable to the *Statesman's Year Book*; and there is no record of political events such as is supplied to British readers by the *British Annual Register*. The need of a comprehensive annual reference book in this field is too obvious to require demonstration. The only questions are those which concern the manner of execution. The chief difficulties arise from space limits, and the danger of disproportionate treatment and of the omission of important topics. As regards space the NEW INTERNATIONAL YEAR BOOK has an advantage over most annual publications in, that by reducing to a minimum introductory manner such as is to be found in general works of reference and is not especially applicable to the year, it gains space for the more adequate treatment of the year itself. It does not carry the same text, revised from year to year, but prepares the entire text anew each year. As to proportionate treatment and the proper selection of topics, no work of reference is free from defects, but an annual volume ought to show steady improvement in these respects, profiting from criticism and suggestion. The YEAR BOOK for 1909 exceeds somewhat the length of the previous year's issue. It includes an account of the recent progress of BIBLICAL CRITICISM, a more extended review of ELECTORAL REFORM proposals and achievements, with a special article under that head by Mr. Clinton Rogers Woodruff, and an ampler treatment of MUNICIPAL GOVERNMENT.

Among the leading features of the year 1909 requiring treatment in the present volume, the following may be mentioned: The movement of financial recovery which began in the clos-

SOME FEATURES OF THE 1909 VOLUME—THE UNITED STATES ing months of 1908, gained strength in 1909, and in many industries, conditions were better than they were before the panic. Under the title FINANCIAL REVIEW will be found an account of the general tendencies, and in separate articles on the leading industries, on crops and on foreign countries, more specific details are given. The articles on AGRICULTURE, and allied topics, pre-

pared under the direction of experts in the Department of Agriculture in Washington, record the most prosperous year in the history of the United States. Despite the improved methods of production and the increased output, the high prices continued, and before the close of the year, discussion of the high cost of living, most of it vague and speculative, had already swollen to formidable bulk. Facts bearing on this problem will be found in the articles PRICES, FOOD AND NUTRITION, AGRICULTURE, etc. In the United States the chief political interest of the year centred in the TARIFF, whose provisions are analyzed under that title, and whose passage through Congress with a summary of the debates will be found under the UNITED STATES, paragraphs on *Politics and Government*. Public interest in the subject of CONSERVATION OF NATURAL RESOURCES, continued during the year, and the matter assumed a political aspect, owing to the BALLINGER-PINCHOT CONTROVERSY, which is discussed in the article LANDS, PUBLIC, and in the paragraphs on *Politics and Government*, under UNITED STATES. In the historical paragraphs under UNITED STATES will also be found an account of the spirited controversies that arose in the closing months of the ROOSEVELT ADMINISTRATION over the Secret Service, over the absorption of the Tennessee Coal and Iron Company, and over the President's letter in regard to Senator Tillman; a review of the TAFT ADMINISTRATION, and of the contest as to the powers of the Speaker; a summary of both sessions of CONGRESS, of the FOREIGN RELATIONS of the United States, of the frauds in the CUSTOM HOUSE, etc. In the political record under the separate States, which has been revised by the editors of leading newspapers in each of the States, will be found a summary of legislation, and of the chief events in party politics, and a record of such important happenings as the collapse of the re-

PREFACE

form movement in San Francisco; the spread of PROHIBITION in Indiana and other States, and the check administered to the movement in Alabama where the constitutional amendment was defeated; the result of the November elections, especially in New York State, etc.

GREAT BRITAIN passed through the most interesting political year in her recent history. TURKEY was the scene of a counter-revolution, whose prompt and complete suppression, followed by the deposition of Abdul Hamid, illustrated the strength of the new régime. Disorders in PERSIA finally culminated in the triumphant entry of the Nationalist forces into Teheran the restoration of the constitutional régime, the deposition of the Shah, and the accession of his young son, Ahmed Mirza. SWEDEN was the scene of one of the most formidable strikes

in the history of labor on the continent of Europe. SPAIN was for many months the centre of public interest, owing to the Riff War, the Barcelona Riots, and the execution of Professor Ferrer. Republican institutions in FRANCE seemed for the moment menaced by the alarming advance of syndicalism, as illustrated by the two postmen's strikes. Naval maladministration was one of the chief topics of the year, and the debate on that subject in the Chamber led to the downfall of the Clemenceau Ministry, and the accession of M. Briand to the premiership. THE BALKAN QUESTION reached an acute phase in the early months of the year, when war between Austria and Servia seemed at any moment imminent, but matters were finally amicably adjusted, and the Austrian annexation of the two provinces was acknowledged by the Powers as an accomplished fact. Negotiations with Turkey and Bulgaria as to compensation were successfully carried out. The weakness of parliamentary institutions in GREECE was illustrated by the mutinous spirit in both army and navy and by the high-handed measures of the Military League. In AFRICA a turning point was reached through the formation of the SOUTH AFRICAN UNION. In the Far East the long-standing difficulties between China and Japan were settled, for the time being at least, by the agreements of August and September.

In MECHANICAL ENGINEERING new methods evolved during the year for using the STEAM-TURBINE efficiently as exemplified by the Melville-MacAlpine Reduction gear, offered a topic of more than passing interest. BRIDGE and CANAL construction moved on rapidly during the year, and the progress on the Panama Canal was as steady and important as it was lacking in sensational features, after the APPLIED SCIENCE, ETC. settlement of the lock vs. sea-level controversy. In other branches of CIVIL, MECHANICAL, SANITARY, and ELECTRICAL ENGINEERING the year's progress,

while not marked by achievements of extraordinary importance and magnitude was of such character that it cannot be disregarded; and the same is true of BOTANY, CHEMISTRY, PHYSICS and the other sciences, although in ASTROLOGY the approach of Halley's comet contributed in addition, matter of popular interest. In AÉRONAUTICS the record was an unusually interesting one, including M. Blériot's notable flight across the Channel. In MEDICINE attention was called to the efforts to cope with such diseases as the SLEEPING SICKNESS, the HOOKWORM DISEASE, PELLAGRA, and CANCER, in all of which progress was reported. In MILITARY and NAVAL AFFAIRS the year was marked by many changes. Extensive rearmaments, especially of the artillery of European armies emphasized the ever present prospect of war. The MANOEUVRES of the year were conducted in a more practical spirit and on a larger scale. The NAVIES showed not only an increase in the size and number of battleships, but equally important changes in the development of personnel and equipment.

The material for the statistical articles is derived from official sources, and in the preparation of these articles as well as of those which deal with public affairs, especially in the United States and Canada, invaluable aid has been given by government officials. Among those to whom special recognition is due for such services may be mentioned the following: Major Frank McIntyre, Acting Chief of the Bureau of Insular Affairs, for information in regard to the Philippines; Mr. O. P. Austin, Chief of the Bureau of Statistics, Department of Commerce and Labor; Mr. E. Dana Durand, Director of the Census; various officials in the Departments of War, Navy and the Interior; the Superintendents of Education, Commissioners of Charities and Corrections, Treasurers, the officers of colleges, societies and religious bodies; and the editors of leading newspapers in the States, who have coöperated in the preparation of the paragraphs on State politics and history.

NOTE: Cross references in **SMALL CAPITALS** indicate that the allusion is to a separate article; cross references in ***italics*** denote that the reference is to a subdivision of a main article. A cross reference in ***italics***, standing alone in an article, carries the reference to another subdivision of the same article. The letters **q. v.** (*quod vide*=Latin "which see") in parenthesis following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

THE NEW INTERNATIONAL YEAR BOOK

A**BANDONED FARMS.** See AGRICULTURE.
ABDUL HAMID II. See TURKEY.
A'BECKETT, ARTHUR WILLIAM. An English writer and dramatist, died January 14, 1909. He was born at Fulham, October 25, 1844, and was educated at Felstead School. He served for some years in the War Office, and also practiced law. From 1865 to 1868 he edited the *Glowworm* and from 1868 to 1870 the *Britannia Magazine*. He acted as special correspondent in the Franco-German War, and in 1874 joined the staff of *Punch*, on which he remained until 1902. In 1902-3 he edited *John Bull*. A'Beckett wrote several three-act comedies, and many books, among them, *The Ghost of Grimstons Grange* (1877), *The Mystery of Mostyn Manor* (1878); *Modern Arabian Nights* (1885); *The Modern Adam* (1899); *The a'Becketts of Punch* (1903).

ABRUZZI, DUKE OF THE. See EXPLORATION.

ABYSSINIA. An independent country in eastern Africa comprising several so-called kingdoms besides territories and dependencies. The area is estimated at 308,000 square miles, and the population at upwards of 9,000,000. The resident population of most of the towns is very small, but the capital, Addis Abeba, is stated to have between 30,000 and 35,000 inhabitants; Harrar, 40,000; Gondar, 5000; Aksum, 5000; Mahdera-Mariam, 4000; and Diré Dawa, 4500. Coptic Christianity is preferred, and education, which, according to an edict issued by the Emperor in October, 1907, is compulsory for male children, is carried on by Coptic teachers provided by the government.

The inhabitants are largely engaged in the raising of cattle, sheep, and goats. Next in importance is agriculture, though backward; coffee and cotton production, however, is increasing. Placer gold mining is carried on to some extent. Foreign trade is conducted principally through Harrar, where in the fiscal year 1905-06 the imports were valued at 4,046,100 dollars and the exports at 3,377,440 dollars (dollar=about 50 cents). The greater part of the imports consisted of cotton goods, and nearly one-half of American gray shirting. The exports consisted of coffee, 1,206,260 dollars; hides and skins, 1,142,000; ivory, wax, gold,

ghee, civet, and gum arabic. Besides Harrar important trading centres are Addis Abeba and Ankober.

There are very few good roads in Abyssinia, but in and about Addis Abeba some metalled roads have recently been constructed. A railway extends from Jibuti, on the French Somali coast, 193 miles to Diré Dawa, about 25 miles from Harrar. In January, 1909, a new company was formed to complete the line through Harrar and to Addis Abeba, 528 miles distant from Jibuti. The survey has been made and grading begun. Telegraph lines (over 1000 miles) connect the capital with Harrar, with Jibuti, and with Massawa, in Eritrea. There is also a considerable amount of telephone line.

The financial business of the government is transacted by the Bank of Abyssinia (main office at Addis Abeba), which has an authorized capital of £500,000. The current coin of the country is the Maria Theresa dollar, but the new Menelek dollar (the talari, worth about 50 cents) is the official standard.

The Abyssinian government is essentially of a feudal character. Each of the large provinces is governed by a *Ras*, a prince or feudal chief, under whom are governors of districts and chiefs of villages. The more important *Rases* constitute a kind of state council. At the head of the state is the Emperor, Menelek II. in 1909, who as King of Shoa became ruler of all Abyssinia in 1889. He has constituted a council of ministers, which met for the first time in July, 1908. The administration of justice lies with the *Rases* and petty chiefs, with right of appeal to the Emperor.

The Abyssinian army consisted of standing forces or garrisons under the command of the *Ras* of each province but susceptible of being united to form a single united army whose strength was estimated at 100,000 men. The organization and control of this united force is very weak and the armament and equipment far from uniform. The mounted men constitute an irregular cavalry, the infantry were in part armed with French repeating rifles, while the artillery was provided with 50 modern and 30 old pattern field guns. In the mountain batteries there were included some Hotchkiss guns. In addition to the forces mentioned the retainers of the various chiefs were considered

as available for military service, forming a sort of militia, the strength of which was put at about 140,000 men.

Owing to difficulties between the Emperor and the new company which had taken over the property of an earlier company formed to construct a line from Diré Dawa to Addis Abeba, but forced by the French government into liquidation, the Emperor canceled his concession in March. In spite of this the company began work at Diré Dawa. Lidj Jeassu (or Eyassu), son of the Emperor's daughter and one of the powerful Abyssinian chiefs, who had been declared successor by Menelek in 1908, was married on May 16, 1909, to the Princess Romanie, the daughter of the late Emperor John.

ACADEMIES, THE INTERNATIONAL ASSOCIATION OF. An Association established in 1899 on the initiative of the Royal Society of London, representing twenty academies and learned associations of Europe and America. Delegates of the constituent bodies meet once in every three years. Meetings were held in Paris in 1901, London in 1904, and Vienna in 1907. The next meeting will be held in Rome in 1910. The International Catalogue of Scientific Literature is one of the projects with which the Association is occupied. Others are a complete edition of the works of Leibnitz, an encyclopedia of Islam, and the consideration of the question of the interchange of manuscripts and books between different countries.

ACADEMY, BRITISH. See BRITISH ACADEMY.

ACADEMY, FRENCH. (ACADEMIE FRANCAISE). An institution founded in 1635 by Cardinal Richelieu, and reorganized in 1910. It is the first of the five academies constituting the Institute of France, the other four being: the Academy of Inscriptions and Belles-lettres, Academy of Sciences, Academy of Fine Arts, and Academy of Moral and Political Science. The Academy consists of forty members. It is the chief tribunal of questions relating to the niceties of the French language and of grammar, rhetoric, poetry and the classification of French classics. The members receive an annual stipend of 1500 francs, and in addition, the six members of the Dictionary Committee receive each 1000 francs annually. The Academy annually distributes 12,000 francs in prizes alternately for poetry and eloquence, besides a number of smaller prizes. Five new members were chosen in that year as follows: René Doumic to fill the vacancy caused by the death of Boissier; Marcel Prevost to fill the vacancy caused by the death of Sardou; Jean Aicard to fill the vacancy caused by the death of Coppée; Eugène Brieux to fill the vacancy caused by the death of Halévy; and Raymond Poincaré to fill the vacancy caused by the death of Emile Gebhardt. There was still one vacancy at the end of 1900. The present academicians and the dates of their election are:

Emile Ollivier, 1870; Alfred Jean François Mézières, 1874; Othénin P. de Cléron Comte d'Haussounville, 1886; Jules Arnaud Arsène Claretie, 1888; Eugène Marie Melchior, Vicomte de Vogué, 1888; Charles Louis de Saulces de Freycinet, 1890; Louis Marie Julien Viaud (Pierre Loti), 1891; Ernest Lavisse, 1892; Paul Louis Thureau-Dangin, 1893; Paul Bour-

get, 1894; Henri Houssaye, 1894; Jules Lemaitre, 1895; Jacques Anatole Thibault (Anatole France), 1896; Louis Jules Albert, Comte Vandal, 1896; Albert Comte de Mun, 1897; Gabriel Hanotaux, 1897; Henri Léon Emile Lavedan, 1899; Paul Deschanel, 1899; Paul Hervieu, 1900; Auguste Emile Faguet, 1900; Charles Jean Melchior, Marquis de Vogué, 1901; Edmond Rostand, 1901; Frédéric Masson, 1903; René Bazin, 1903; Etienne Lamy, 1905; Alexandre Félix Joseph Ribot, 1906; Maurice Barrès, 1906; Marquis de Ségrur, 1907; Maurice Donnay, 1907; Maître André Barboux, 1907; Jules Henri Poincaré, 1908; Jean Richepin, 1908; Frances Charmes, 1908, René Doumic; Marcel Prevost; Jean Aicard; Eugène Brieux; Raymond Poincaré, 1909.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A body which had its beginning in 1898 when, at its annual meeting the American Social Science Association nominated a small group of authors and artists to constitute a National Institute of Arts and Letters. Qualification for membership in this body was to be notable achievement in art, music or literature, and the membership was limited at first to 150 and afterwards to 250. When the Institute had gathered to itself a large proportion of the chief authors and artists of the United States, it declared its purpose of proceeding to an organization of an Academy of Arts and Letters, the members of which should be chosen from the members of the Institute. It limited the number of members in the new Academy to be chosen from the National Institute of Arts and Letters to seven, and provided for a progressive responsibility in the choice of those to be elected later. The first seven members were selected in 1904 and were the following: William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John La Farge, Samuel Langhorne Clemens, John Hay and Edward MacDowell. These seven original members were empowered immediately to elect eight more and then chose: Henry James, Charles Follen McKim, Henry Adams, Charles Eliot Norton, J. Q. A. Ward, T. R. Lounsbury, Theodore Roosevelt and Thomas Bailey Aldrich. These fifteen then proceeded to elect five more—Joseph Jefferson, John S. Sargent, R. W. Gilder, H. H. Furness, and John Bigelow. These twenty representatives then elected ten additional, raising the total membership to thirty. The new members chosen were Winslow Homer, Carl Schurz, A. T. Mahan, Joel Chandler Harris, D. C. French, John Burroughs, J. F. Rhodes, E. A. Abbey, Horatio W. Parker, and William M. Sloane.

The constitution of the Academy declares that its aim is to represent and further the interests of the fine arts and of literature. It established fifty as the limit of its membership. Elections have taken place at intervals during the past five years, first to enlarge the membership from thirty to fifty, and then to fill the vacancies which have been caused by death. There are still several vacancies to be filled to make up the full membership of fifty. As it was constituted in 1909 the Academy was composed of one architect, two composers, two sculptors, eight painters and the remainder men of letters.

The members in 1909 were as follows: Edwin Austin Abbey, Charles Francis Adams, Henry Adams, John Bigelow, Edwin Howland Blash-

field, William Cary Brownell, John Burroughs, George Washington Cable, George Whitfield Chadwick, William Merritt Chase, Samuel Langhorne Clemens, Kenyon Cox, Henry Van Dyke, Daniel Chester French, Horace Howard Furness, Basil Lanneau Gildersleeve, Arthur Twining Hadley, Thomas Hastings, Thomas Wentworth Higginson, Winslow Homer, Julia Ward Howe, William Dean Howells, Henry James, Robert Underwood Johnson, John La Farge, Henry Cabot Lodge, Thomas Raynesford Lounsbury, Hamilton Wright Mabie, Alfred Thayer Mahan, Brander Matthews, William Vaughan Moody, John Muir, Thomas Nelson Page, Horatio William Parker, James Ford Rhodes, Theodore Roosevelt, John Singer Sargent, William Milligan Sloane, Francis Hopkinson Smith, Abbott Henderson Thayer, Elihu Vedder, John Quincy Adams Ward, Andrew Dickson White, Woodrow Wilson, George Edward Woodberry.

Deceased: Thomas Bailey Aldrich, Francis Marion Crawford, Richard Watson Gilder, Daniel Coit Gilman, Edward Everett Hale, Joel Chandler Harris, John Hay, Bronson Howard, Joseph Jefferson, Henry Carey Lea, Edward MacDowell, Charles Follen McKim, Donald Grant Mitchell, Charles Eliot Norton, Augustus Saint-Gaudens, Carl Schurz, Edmund Clarence Stedman.

The officers of the Academy are: President, William Dean Howells; Chancellor, Professor W. M. Sloane; Permanent Secretary, Robert Underwood Johnson.

ACONCAGUA, MOUNT. See EXPLORATION.

ADEN. A British dependency in southwestern Arabia, forming a part of the Bombay Presidency. Area, 75 square miles; population in 1901, 41,222. Attached to Aden are the island of Perim (area 5 square miles; population, 2752), the Kuria Muria Islands (ceded by the Sultan of Oman for landing the Red Sea cable), and the Aden Protectorate, which has an area of about 9000 square miles and a population of about 100,000. Aden is strongly fortified, and is important chiefly for its strategic position at the entrance to the Red Sea and as a coaling station. The trade is almost entirely a transhipment one. The leading imports are cotton goods, grain, hides and skins, and tobacco; exports, the articles mentioned as imports and coffee, gums, civet, ivory, and wax. In 1907-8 the sea-borne imports were valued at Rs. 44,669,050, and the sea-borne exports, Rs. 40,471,120 (1 rupee=32.44 cents); imports and exports by land, Rs. 2,475,007 and Rs. 1,652,492, respectively. The boundary between the Aden Protectorate and the Turkish vilayet of Yemen, until recently in dispute, has been delimited.

ADULTERATION. See Food and NUTRITION.

ADVENTISTS, SEVENTH DAY. A religious denomination which was founded originally on the doctrine of the second coming of Christ, which was quite extensively believed in the United States and Europe during the years 1840-44. In the earlier movement the Adventists held that the prophetic period of Daniel 8 reached to 1844—and "then shall the sanctuary be cleansed," which they interpreted to mean the cleansing of the earth at the coming of Christ. After the passing of the time set for this in 1844, many of the believers gave up the doctrine, while others, on reviewing the histori-

cal prophetical evidences, thought that the mistake was in believing that the sanctuary to be cleansed was this earth, whereas it was the sanctuary in Heaven that was to be cleansed, referring to the final work of Christ in the heavenly sanctuary, just before his second coming. Thus, there arose in New England in 1840 a small body who, while believing in the second coming of Christ, have never set a time for that event, but hold to the Scripture statement that it is "near, even at the door," and also observe the seventh day of the week as the Sabbath. At the close of 1909 the Seventh Day Adventist denomination, whose headquarters are at Washington, D. C., had 22 union conferences, 107 local conferences, 135 foreign mission stations, 33 being in non-Christian lands, and over 2500 churches in eighty of the principal countries of the world, with about 100,000 communicants. For the spread of the evangelistic work there was contributed by the denomination during 1909 approximately \$2,000,000. In institutional lines the work is represented by 40 colleges and academies, and 550 primary and intermediate schools. There are 26 denominational publishing houses, which print 125 papers. The denomination also operates over 80 sanitaria with which there are connected over 2000 physicians and trained employees. The next general conference of the denomination meets in 1913.

There are in addition to the Seventh Day Adventists several bodies bearing the name of Adventists which have practically nothing in common with the former except possibly the doctrine of the second coming of Christ, and even there the connection is remote. These bodies are the Evangelical or the Advent Christians, Church of God, the Liberal Advent Union, and the Churches of God in Jesus Christ. Of these the Advent Christians numbered in 1909 26,799 communicants, 550 churches and 528 ministers. The Churches of God in Jesus Christ numbered 2124 communicants, with 62 churches and 56 ministers. The other bodies are composed of but a few hundred respectively. The Advent Christians publish several papers, including the *World's Crisis* and the *Messiah's Advent*.

AERONAUTICS. The successful flights of the Wright Brothers and Henri Farman with their biplanes in 1908 had demonstrated the practical achievement of a heavier-than-air machine that could maintain itself in the air and fly over considerable distances at the control of the operator. These were followed in 1909 by further advances in the science and practice of aviation no less marked than they were sensational. During 1908 the monoplane in the hands of Blériot and Esnault-Pelterie had been developed to a point where it was capable of extended flight, but even at the end of the year the biplane with the double supporting surface was looked upon as the far more practical machine. In 1909, however, the monoplane shared the honors with the biplane and was wonderfully successful at the big aviation meets, besides figuring in some sensational flights. In fact in considering the record of the year in aviation due emphasis must be placed on many sensational achievements, though these must not be permitted to obscure the mechanical improvements in the various machines effected by numerous inventors or the evolution of various distinct types brought about through the

efforts of careful designers. Furthermore these same sensational achievements doubtless aroused in the public mind the belief that the era of widespread and commercial navigation of the air was at hand, and that aëroplane and airship would soon rank with, if not supplant, the battleship as engines of war. By some qualified critics it was believed that at the end of the year 1909 a certain limit had been attained in the development of the flying machine, notwithstanding the demonstrated success of machines of varied types and designs. For with the development of designs of flying machines must be considered the improvement of the light-weight high-efficiency internal combustion motor as developed from that employed on motor boats and motor vehicles. This type of engine by 1909 had reached a high state of perfection and no great advances or radical innovations in design or construction could be anticipated. In the construction of the aëroplanes themselves there was demanded naturally a maximum of strength with a minimum of weight such as was to be found in no other branch of mechanical engineering. This was attained by various designers in different ways, certain features often presenting distinct advantages. Nevertheless the fact that stood out prominently in many of the competitions was the necessity of considering the ability of the aviator, and often skill in control and manœuvring figured even more conspicuously than mere design of the supporting surfaces. In fact, M. G. Garnier, writing in *L'Aérophile*, states that the conclusions to be drawn from the competitions at Rheims in 1909 might be summarized and expressed in figures, thus: Pilot's importance, 60 per cent.; motor's importance, 30 per cent.; importance of the machine itself, 10 per cent. Perhaps the results of the year's work might be summarized briefly before passing to the consideration of the year's leading events. Speaking generally it may be said that there was less development in the biplane as used by the Wrights, Curtiss, Farman, Voisin, and others over the machines of 1908, and that by their reliability and stability they had been brought to approach a standard or final type. The biplane, which it was recognized would prove more speedy if stability could be secured, was greatly improved, and for speed and high flying met with great success and led to extensive construction of more or less similar machines. Ease of handling was secured with these monoplanes, and the instability predicted was not realized and their successful operation in some very daring flights as well as in competition was noteworthy. Triplanes and quadroplanes were also tested during the year, but without important results, and likewise no startling achievements were to be recorded in helicopters or other similar devices.

WRIGHT BROTHERS AÉROPLANE FOR U. S. ARMY. In July Orville Wright resumed the acceptance tests of the aëroplane built for the United States Army at Fort Myer, which had been interrupted by the accident of the previous year in which Lieutenant Selfridge was killed and Mr. Wright injured. These trials, which lasted for the best part of two weeks, proved eminently successful and resulted in the acceptance of the machine at the contract price of \$30,000, all the conditions being fully satisfied. In an official time test held on July 27, the machine carrying a passenger in addition to

the aviator, was in the air for one hour and thirteen minutes, flying in closed circles over the drill field. On July 30 the government test was completed by a flight of ten miles across country in 14 minutes or at an average rate of 42.58 miles an hour. A passenger was also carried in this test and the aëroplane was demonstrated to be thoroughly under control. After its acceptance by the government the new aëroplane was sent to a post of the Signal Corps at College Park in Maryland, where a number of the officers received instruction in its use and management and numerous flights were undertaken.

FLIGHT ACROSS BRITISH CHANNEL. Popular attention was directed to the aëroplanes of MM. Blériot and Latham by their attempts to fly over the English Channel in the early summer. In the previous year M. Blériot had exhibited an aëroplane of excellent design and construction and had made a notable cross-country flight which indicated that he must be considered in the progress of aviation. M. Latham, on the other hand, began his flights with the Antoinette monoplane in the spring of 1909, and on June 12 at Juvisy he made a flight of 30 miles in 39 minutes, winning the Goupy prize. Straightway he determined on a flight across the English Channel, and on July 19, starting from Sangatte, made the attempt. This was unsuccessful owing to defective operation of the engine and Latham fell into the sea after going 11 miles and was rescued by an accompanying torpedo boat. A second attempt on July 27 also failed, though the aviator was within a mile and a half of Dover when he fell into the sea and again was rescued with his machine. In the meantime Louis Blériot, who had made some promising flights with his new monoplane during the spring and early summer, also went to Calais and on July 25 successfully accomplished the first flight across the British Channel in a heavier-than-air machine, from Baraque to Dover, a distance of 32 miles, which was accomplished in 35 minutes. For distance this was by no means a record flight and conditions were not as difficult as in many cross-country flights, but the achievement straightway struck the popular fancy, so that an even greater interest was manifested in the subject of aviation. On August 7 Wilbur Wright's record of 2 hours, 20 minutes, 23 seconds for duration of a flight, made December 31, 1908, at Auvours, winning the Michelin cup, was supplanted by that made by Roger Sommer, a pupil of Farman, who flew for 2 hours, 27 minutes, 15 seconds.

THE RHEIMS AVIATION MEET. Interest in aviation further was stimulated by an important gathering at Rheims, France, beginning August 22, where various competitions were held in which 38 aëroplanes were entered and of these 36 made successful flights. This very successful meet must be considered as marking an epoch in the history of aviation, and here were represented machines of many different makers and schools, the great majority of which had passed the experimental stage. There were monoplanes and biplanes engaged in active competition, and so general was the testing of the different machines that at times as many as six were to be seen manœuvring in the air at once. Furthermore, during the competition various conditions of wind prevailed and it was shown that the aëroplane had reached a point

APPROACHING THE ENGLISH COAST**

in its development where it was no longer forced to wait for a perfect calm or ideal state and direction of the wind. Both speed and endurance were successfully demonstrated, a record of 47.78 miles an hour being made in a short-distance competition, while in an endurance test in a long-distance race 111.88 miles were made in 3 hours, 4 minutes, 55 $\frac{1}{2}$ seconds. In all of the machines ability to control and manœuvre had been so secured that this point had come to be taken for granted.

The leading events at the Rheims meet were the competition for the James Gordon Bennett International Cup, valued at \$2500, together with a cash prize of \$5000 for the successful pilot, for the fastest time over 20 kilometres (12.42 miles), and the Grand Prix for the greatest endurance. The former was won for America by Glenn H. Curtiss in a biplane of his own design. This aviator on July 24 at Mineola, Long Island, had for a second time won the Scientific American trophy, making a flight of 24.947 miles in 52.30 minutes, at an average speed of 28.51 miles per hour. The machine employed was a biplane weighing 507.1 lbs., to which must be added the gasoline, oil and water, 33.1 lbs., and the weight of the aviator, etc., 176.3, making a total weight of 716.5 lbs. The highest speed attained was 47 miles per hour, and the time for the course 15 minutes, 50 $\frac{1}{2}$ seconds. The Curtiss aëroplane carried a single passenger and was the lightest of all the machines in the competition. With the exception of Blériot XI., a monoplane designed for speed, it was the lightest of the machines shown at the meet. Second place in the Bennett cup race was taken by Mr. Blériot with Blériot XII., a larger machine than that used for his cross-Channel trip. This monoplane was fitted with an E. N. V. motor and had a total weight of 1355.8 lbs. Blériot's time was 15 minutes, 56 $\frac{1}{2}$ seconds, and his speed 42.5 miles per hour. H. Latham in an Antoinette aëroplane and E. Lefebvre in a Wright machine also qualified in this competition, being placed in the order named. For the Grand Prix of Champagne a number of machines were entered and made creditable performances. The winner was M. H. Farman in a Farman aëroplane with a Gnome motor, the entire machine with its pilot weighing 1212.5 lbs. The distance was 111.88 miles, covered in 3 hours, 4 minutes, 55 $\frac{1}{2}$ seconds. The motor of this aëroplane was very light, being of the revolving-cylinder-air-cooled type. In the 10-kilometre speed competition, first place and a new record were won by M. Blériot with his monoplane, making the distance (6.21 miles) in 7 minutes, 48 seconds, or at a rate of 49.1 miles per hour. Second in point of speed came Curtiss. Some surprise, especially in the United States, was expressed that the Wright machines, of which those piloted by MM. P. Tissandier, E. Lefebvre, and Comte de Lambert were conspicuous in the competitions, did not win the highest prizes. This was explained by the fact that in most of the competitions speed rather than mechanical efficiency counted. Thus the Wright machines showed much less difference when operated by different pilots and were first from the point of the useful load carried. The two propellers revolved with a relatively slow motion, making for efficiency, and the motors have been developed to a point of assured reliability.

The Rheims contests were marked by an en-

tire absence of untoward circumstances and were in every way most successful, so that serious accidents in the early autumn and through the final months of the year came with shocking emphasis. The first of these was the death of M. Lefebvre at Juvilly, while testing a new Wright biplane on September 7. On September 22 at Boulogne Captain Ferber, whose name had long been associated with the development of aéronautics in France, was killed when his machine was capsized by striking an obstacle in the course of a low flight.

SANTOS-DUMONT'S NEW AÉROPLANE. During the autumn there appeared one of the most interesting aëroplanes of the year, the "Demoiselle" of Santos-Dumont, the pioneer worker with the dirigible balloon. This was a monoplane weighing but 260 pounds without the pilot and having a surface of planes amounting to 97 square feet with a spread of 16.4 feet. Comparing this weight with the 580 lbs. of the Curtiss machine and the 882 lbs. of the Wright aëroplane, with 215 and 538 square feet of surface of supporting planes respectively, the significance of this new aëroplane may be appreciated. With this machine Santos-Dumont accomplished some fast and interesting flights, covering the distance from St. Cyr to Buc, 8 kilometres (4.97 miles) in 12 minutes on September 13, and four days later in a cross-country flight he accomplished an even longer trip. By many authorities this interesting little machine was regarded as the most striking development of the year, as the reduction in size of a practical flying machine was a marked step forward.

Popular interest was aroused in America by a flight made by Wilbur Wright in connection with the Hudson-Fulton Celebration in New York, in the course of which he flew from Governor's Island over the Hudson River as far at Grant's Tomb and return. Glenn H. Curtiss also exhibited his aëroplane in flight at Governor's Island. Besides being ocular demonstrations of the aëroplane, the exhibition possessed but little importance aside from its public features, and attention next centred on a German exhibition held at Potsdam. Here Orville Wright was present and made a number of successful flights in the presence of the Emperor, and one with the Crown Prince as a passenger. At this time he made a record for height, attaining a distance estimated at 1800 feet or over, as well as one for sustained flight with a passenger, being in the air 1 hour, 35 minutes. High flying now began to attract more attention and the Count de Lambert in the course of a 30-mile flight over Paris sailed above the Eiffel Tower on October 18, at a distance of 1300 feet above the ground. M. Paulhan also made some interesting high flights. On November 3 occurred an important flight by M. Farman, when at Mourmelon-le-Grand he was in continuous flight for 4 hours, 17 minutes, 53 seconds, covering a distance of 144 miles. On December 30, Leon Delagrange in a Blériot monoplane made a record of 124 miles in 2 hours and 32 minutes.

DIRIGIBLE BALLOONS. Improvement in speed and endurance rather than radical innovations in design characterized the progress of the airship during 1909. Count Zeppelin's work of previous years culminated in his powerful dirigible, "Zeppelin III.", with which he made a record flight from Friedrichshafen to Berlin and return, a total distance of 800 miles. This was

accomplished between August 27 and September 2, the trip being made with five stops, and the arrival at Berlin being witnessed by the Emperor. Several balloons were constructed during the year and various trials were held for the government, particularly with a view to ascertaining whether the balloon could rise beyond the range of rifle and artillery fire. "Zeppelin I." was taken by the army and was employed frequently in practice ascents. The Zeppelin airships, it will be recalled, are of huge size, with a number of gas compartments arranged in a rigid frame. They can carry a considerable crew, often as many as 26, and supply of provisions and are in every way suited for long-distance traveling. As in the case of the aéroplane, an increased independence from the effects of adverse weather conditions was enjoyed. Good speed was maintained, and in a trip from Friedrichshafen to Munich 100 miles were made in 4 1-2 hours, while a flight of 150 miles was made in 4 hours. The aéronautical division of the German army continued its experiments with the Gross airship, which is about half the size of the Zeppelin, having a steel stiffening frame but not the elaborate car and machinery of the larger airship. It furnished a model for other airships which were added to the army or were under construction during the year. The success which was expected of the Parseval II. airship accepted by the government in 1908 was attained and a Parseval III. was completed in 1909. The Parseval has no rigid frame and may be packed when deflated in an ordinary wagon; thus making it especially serviceable for military purposes. However, it has been deemed equally available for general transportation purposes, and in December an airship of this type was ordered for delivery in the following May by the Munich Aéronautical Company, a concern with a capital of \$100,000. The contract price was \$70,000 and the airship is to be delivered about May 1, when tours from Munich to Walchen Lake in Upper Bavaria will be undertaken. The German army in the course of its experiments and manœuvres also employed the Gross airship, a dirigible of the semi-rigid type, added to the aéronautical section in the previous year. In 1909 the German government had in operation the following airships: Zeppelin I. and II., Gross I. and II., and Parseval I. and II., in addition to two others in course of construction. Experiments with wireless telegraphy from airships were carried on, and the airships figured extensively in the military manœuvres of the year.

The activity of the French army with its dirigible balloons continued in 1909, and the fleet consisted of *Ville de Nancy*, *Ville de Paris*, *Lebaudy*, *Liberté*, and *Colonel Renard*, besides *La République*, destroyed on September 25 (see below). Several of these balloons participated in manœuvres, and the old *Lebaudy* underwent a test under what might be considered service conditions, being moored in the open air for ten days inflated and exposed to winds. This was to determine the feasibility of a non-rigid dirigible being able to land and make repairs in case of being harassed by an enemy. In practically all the large European nations dirigibles were in use and new balloons were being ordered, extensions of the balloon sections of the armies being general. Much was being done in secret and considerable sums for aéronautical maintenance

and experiment figured in the military budgets of all the European nations.

A serious accident occurred in the wreck of the French military airship *La République*, which occurred on September 25, and resulted in the death of the four occupants of the car, Captain Marechal, Lieutenant Chaure, M. Reau, and M. Vincenot. The accident occurred when the balloon was in the air at a height of 300 feet and was caused by the breaking off of one of the propeller blades, which tore through the gas envelope and caused the airship to fall. *La République* was an airship of the semi-rigid class with a gas capacity of 127,100 cubic feet. It had fixed and movable horizontal and vertical planes to assist in its control and was driven by an 85 h.-p. Panhard motor driving two propellers 8½ feet in diameter.

There was held on June 25 at Indianapolis, under the auspices of the Indianapolis Aéro Club, the National Distance Race and the Indiana Endurance Race. In the former, for a trophy offered by the Aéro Club of America, there were six starters and the race was won by "University City," owned by John Berry and John McCullough of St. Louis, which covered 380 miles. Second place was won by "New York," which by rising to a high altitude and encountering stronger winds than below was able to make 357 miles. The course for all the balloons was almost directly south and the other balloons accomplished the following distances in their journeys: "St. Louis," 321 miles; "Indiana," 264; "Hoosier," 234 miles. The Indiana Endurance Race was won easily by "Indianapolis," which remained in the air 22 hours. The races were in many ways disappointing, as no new records were made and many of the competitors descended early, due in part to the poor quality of the gas used.

The rapid development of practical aéronautics brought up many problems of important general and particular interest. Accordingly an International Congress was summoned to discuss such questions as aerial law and the establishment of a standard glossary of aerial terms, and this met at Nancy in September, 1909. The novelty of the situation was as apparent as its importance, so that the recommendations of the Congress aroused considerable interest. The only parallel cases were those in maritime law and these in part served as models. It was recommended that "rules of the road" should apply to airships and that every aerial vessel should be registered and properly documented with passports for crew and passengers to facilitate identification. The atmospheric space above each country was to be considered as belonging to that country, while the idea of restricting aerial traffic to certain routes was not feasible, and instead each nation should be in a position to forbid landing at points where conditions of national security demanded such action. It was recommended that custom duties on foreign balloons should be abolished, but it was held that photographs taken by foreigners should be subject to inspection and possible confiscation. During the year a number of interesting papers dealing with the legal status of aerial navigation were prepared and the questions involved seemed to be of more than academic interest, as it was realized that conditions might soon arise to demand practical solutions.

THE ZEPPELIN AIRSHIP OVER FRANKFORT

AFGHANISTAN. A monarchy of Central Asia, having an estimated area of 225,000 square miles and an estimated population of 5,000,000. The Durranis are the dominant race, but more numerous are the Ghilgais, who number about 1,000,000. The capital is Kabul, with about 70,000 inhabitants; Herat has about 45,000 and Kandahar 35,000. The chief productive occupations of the people are agriculture and stock-raising. The products include cereals, lentils, fruits, and asafetida. These commodities, together with horses and other live-stock, wool, and hides, constitute the bulk of the exports, which also include a few manufactures, as silk and carpets. The leading imports are cotton goods, indigo and other dyeing materials, sugar, and Chinese tea. Commerce is chiefly with India and Bokhara. The trade with India in 1908-9 was valued at over £1,516,000, imports amounting to somewhat more than half of the total. In recent years Russian trade competition has been active. In 1906-7 imports from and exports to Asiatic Russia amounted to about £105,000 and £355,000 respectively. The government is loosely organized and feudal in character. At its head is the Ameer, a hereditary prince whose will theoretically is absolute. The Ameer in 1909 was Habibullah Khan, who succeeded his father, the famous Abdur Rahman Khan, October 3, 1901. The four provinces are administered by governors, under whom nobles dispense justice more or less arbitrarily. The Ameer sustains no foreign relations except through the British-Indian government, from which he receives an annual subsidy of 1,800,000 rupees. Other revenues, the amount of which cannot be determined, is derived mainly from taxes in kind, and their collection is attended with dishonesty and extortion. The total revenue has been roughly estimated at over 12,000,000 rupees.

Afghanistan maintains a standing army which includes 27,000 infantry, 7000 cavalry and a strong force of artillery, to which may be added a large force of irregulars, who are either retainers or more important subjects of local chiefs, numbering about 25,000 mounted and a smaller quota of foot, enabling the army to be expanded and turned out on a war footing of 80,000 horse and 60,000 foot. Considerable progress was made in supplying modern rifles and field guns as well as with drill and organization, so that the army was being placed on a more effective footing. Service in the army is obligatory, but in practice only one in every seven is liable for conscription. At Kabul are maintained efficient ordnance factories and an arsenal. There are in the army 360 guns and it was believed that there were available sufficient breech-loading rifles to equip 100,000 infantry. The native officers of the army are, however, not considered competent to act in any serious service involving the training or leading of troops.

The most important event in the history of Afghanistan during the last few years was the signing of the Anglo-Russian convention on August 31, 1907, whereby Great Britain declared that it would not annex or occupy any part of Afghanistan territory and had no intention of changing the political status of the country, and Russia recognized Afghanistan as outside her sphere of influence and declared that she would conduct all her political relations with it through the British government.

During the month of March, 1909, it was

reported that a plot had been formed against the Ameer and the heir apparent, said to have been inspired by one of the wives of the late Ameer, whose son was at one time talked of as successor. Many arrests were reported at Jellalabad and Kabul, and it was said that a number of prisoners were blown from the guns. The plot was thought to have some relation to a reform movement started by an Indian at the head of the Afghanistan educational department for the purpose of securing the establishment of constitutional government.

AGRICULTURAL EDUCATION. In 1909, as in years closely preceding it, much attention was given by college and school authorities to the promotion of agricultural education. This was true, not only in the United States, but in many foreign countries. At the First Convention of the Pan-American Scientific Congress, held at Santiago, Chile, December 25, 1908, to January 5, 1909, the programme of the section on Agronomy and Zoötechnics was largely taken up with discussions on agricultural education, and the resolutions presented by this section to the congress included recommendations for agricultural instruction of all grades from the most practical elementary instruction to scientific instruction in college courses and in normal schools. The Commission on Country Life (see under AGRICULTURE) recommended "a new kind of education adapted to the real needs of the farming people," which shall include agriculture in the regular public school work, special agricultural schools, and a well-developed plan of extension teaching conducted by the agricultural colleges.

In Canada much attention was given to agricultural education and particularly to the development of courses for the training of teachers at Macdonald College, Ste. Anne de Bellevue, at the Ontario Agricultural College, Guelph, and at the Manitoba Agricultural College, Winnipeg. In Ontario the important experiment was started of appointing six agricultural college graduates as teachers in six high schools, these teachers to serve also as advisers to the farmers in the vicinity of their respective schools. A College of Agriculture was established in connection with the newly established University of Saskatchewan, at Saskatoon, and a four-year course in forestry was introduced at the University of New Brunswick at Fredericton. Traveling schools of stock-judging were conducted in the Province of Alberta by transporting 50 head of improved live-stock from place to place, housing them in local shelters for periods of from one to two weeks, and using them during that time for demonstration purposes in connection with courses of instruction on live-stock.

In England the University of Manchester established a three-year course in agriculture leading to a degree in science. The Board of Agriculture and Fisheries issued a report giving its total expenditures for agricultural education in 1908 as \$58,685, an increase of \$2668

over the previous year. One of the secretaries of the board pointed out that the facilities for instruction in agriculture in England were far from adequate, and called attention to the remarkable fact that this condition was more pronounced in the agricultural counties than in the manufacturing counties. Instruction on rural subjects in the public elementary schools in England is fostered by special grants coming from the Board of Education and it is reported that last year gardening was taught in the schools of every county except two.

In Ireland the promotion of agricultural instruction was conducted under the auspices of the Department of Agriculture and Technical Instruction and much attention was given, not only to instruction in the Royal College of Science, Dublin, Albert Agricultural College, Glasnevin, and other agricultural stations and institutions, but also to special instruction for the preparation of teachers, and to itinerant instruction in all parts of the island.

Germany, following the lead of Italy, began giving instruction in agriculture to subalterns and privates in the German army at Augsberg in 1907, and by 1909 was giving such instruction in 14 other places.

UNITED STATES OFFICE OF EXPERIMENT STATIONS. The Office of Experiment Stations continued to act as the general agency of the United States Department of Agriculture to deal with the various colleges, schools, and extension departments in the United States concerning the promotion of agricultural education. A larger appropriation for this work became available in 1909, and two additional specialists were employed, one in agricultural education and one in farmers' institute work. The work included as formerly (1) the preparation of editorials and abstracts of agricultural education literature for the *Experiment Station Record*; (2) the compilation of statistics of agricultural colleges, experiment stations, and farmers' institutes in the United States; (3) the compilation of directories, organization lists, and address lists of agricultural colleges, schools, experiment stations, extension departments, and of the teachers and other workers in these institutions and in farmers' institutes; (4) the preparation of courses of study and laboratory exercises for agricultural colleges and schools, bibliographies of agricultural literature, lecture syllabi with lantern slides, and annual reviews of progress in agricultural education; and (5) the aiding of educational institutions, associations, and workers, through correspondence, conferences, and public addresses.

AGRICULTURAL COLLEGES. During 1909 the agricultural colleges gave instruction in agriculture to more students than in any previous year, and also did more effective work along other lines. Several of the biennial State appropriations for these institutions approached or passed the half-million mark, notably in Washington (\$487,000), Pennsylvania (\$526,000), and Kansas (\$671,000). The growth of the agricultural colleges was also indicated by the number and character of college buildings completed during the year. Among these were the following agricultural buildings: Georgia, \$100,000; Iowa, \$400,000; Maine, \$50,000; Michigan, \$175,000; Missouri, \$100,000; and Montana, \$80,000. Wisconsin completed a \$75,000 live-stock pavilion, and California

started work on a \$200,000 agricultural building. The aggregate value of permanent funds and equipment of these institutions in 1909 was \$111,882,687; their income, \$18,082,853; and the value of additions to their permanent endowment and equipment, \$6,055,147. The total number of students in four-year courses in agriculture was 6822, and, including short-course students given below, 15,940; as compared with a total of less than 14,000 in 1908.

The number and variety of short courses offered by the agricultural colleges was greater than ever before, and there was also a larger enrollment of students at these courses as shown by the following summary of attendance: Agriculture, 6236; horticulture, 233; forestry, 81; dairying, 610; teachers' courses in agriculture, 1958; total, 9118. In 1908 the total was 7293, or 1825 less than in 1909.

Departments of agricultural education or teachers' colleges were established in connection with the agricultural colleges in Alabama, Arkansas, California, North Dakota, Pennsylvania, and Vermont. Definite provision for the training of teachers of agriculture or for aiding them through extension departments, or special publications, is now made by agricultural colleges in 27 States. Summer schools for white teachers were held in connection with the agricultural colleges in 12 States and for negroes in 6 States. Associations for promoting the interest and preparation of teachers of agriculture were formed in Illinois and Nebraska.

EDUCATIONAL EXTENSION WORK IN AGRICULTURE. The extension features of college work had developed to such an extent that at the annual convention of the Association of American Agricultural Colleges and Experiment Stations held in Portland, Oregon, August 18-20, 1909, the constitution of the Association was so amended as to permit the organization of a section on extension work composed of representatives of extension departments in the institutions represented in the Association. The organization of such a section was effected before adjournment. The Association also favored a Federal appropriation to the States and to the United States Department of Agriculture for extension work, the franking privilege for extension publications, and the organization of separate extension departments by the agricultural colleges. Such departments were organized in 1909 in Georgia, Kansas, Massachusetts, Michigan, and North Carolina.

Farmers' institute organizations were maintained in 1909 in every State and Territory. Reports from 47 States and Territories showed that there were held 4926 regular institutes, consisting of 15,210 half-day sessions, with a total attendance of 2,196,568, and including railroad specials, round-up institutes, and other special forms of institute activity, of almost three millions (2,907,000). The State appropriations for these institutes amounted to \$328,000, an increase of \$12,500 over 1908. Eight normal institutes for the instruction of farmers' institute teachers were held in three States, with an attendance of 1000 institute lecturers. There were 156 sessions of round-up institutes, with an attendance of 39,200; 181 sessions of independent institutes, with an attendance of 380,500; 142 sessions of institutes for women; and many special-subject institutes. States reported boys' and girls' meetings of various kinds.

Fourteen States ran railroad specials and reported an attendance of over 159,000. Numerous other railroad specials were conducted by State boards of agriculture and by the agricultural colleges independent of the institute organizations. In many cases the railroad companies not only furnished trains to the institute directors free of charge, but also provided board and lodging for the instruction force. Movable schools of agriculture were successful wherever tried and were attended by over 2500 persons. The instruction was given by skilled teachers to classes of adults regularly organized, and the sessions continued from one to three weeks in a locality.

SECONDARY AND ELEMENTARY SCHOOLS. Secondary courses in agriculture were started in connection with the agricultural colleges in Colorado, Montana, and Oregon. Two district agricultural high schools were provided for in Idaho, likewise four in Arkansas with a total appropriation of \$160,000. Subsidies were voted to encourage the teaching of agriculture and domestic science in public high schools as follows: In Texas, \$32,000; in Minnesota, 25,000 for ten schools; and in Louisiana \$500 to each school approved by the State Board of Education. In Massachusetts, the Smith Agricultural School and Northampton School of Technology opened at Northampton and smaller agricultural high schools at Petersham and Montague. The five agricultural schools for Oklahoma were located respectively at Warner, Tishomingo, Broken Arrow, Lawton, and Helena. A sixth school, known as Panhandle Agricultural Institute, was established at Goodwell. A county agricultural school, with a new \$25,000 granite building, was opened at Sparks' Station, Maryland.

The introduction of agriculture into the elementary schools was promoted in many States. In this work both the colleges of agriculture and the normal schools participated. In Texas the legislature appropriated \$2000 a year for two years to each of the three State normal schools for departments of agriculture, manual training, and domestic science, and provided also for the introduction of teachers' courses in elementary agriculture in the summer sessions of these schools, as well as in those of the College of Industrial Arts for Girls, the Agricultural Mechanical College, and at the State University. For the support of the summer school work \$3000 annually was appropriated.

Boys' and girls' clubs proved to be very effective agencies for interesting young people in agriculture and home-making, and were reported last year from 29 States, with a total membership of upwards of 150,000.

TEXT-BOOKS AND MANUALS. Many important text-books, manuals and works of reference were published in 1908-9. Among these the three following were unique in the field of agricultural education, in that they were among the first to discuss the philosophy and pedagogy of agricultural education:

Education for Efficiency, by E. Davenport. A discussion of the problem of universal education with special reference to academic ideals and methods and to the introduction of agriculture into secondary and elementary schools.

The Training of Farmers, by L. H. Bailey,

a discussion of the problem and the means of training farmers.

Agricultural Instruction and Its Methods (L'Enseignement Agricole et ses Méthodes), by P. DeVuyst, Brussels, 1909. A manual for teachers of agriculture and students of education, embodying a systematic statement of the different agencies for agricultural education in the principal countries of Europe and North America, and a discussion of methods of teaching and other means of disseminating agricultural information.

Among the books suitable for use in college courses in agriculture, the following are worthy of mention: *The American Apple Orchard*, by F. A. Waugh, 1908; *The Science and Practice of Cheese Making*, by L. L. Van Slyke and C. A. Publow, 1909; *Southern Crops*, edited by G. F. Hunnicutt, 1909; *The Business of Dairy-ing*, by C. B. Lane, 1909; *The Farm Dairy*, by H. B. Gurler, 1908; *Farm Stock*, by C. W. Burkett, 1909; *Gardening in California, Landscape and Flower*, by J. McLaren, 1909; *The Horse Book*, by J. H. S. Johnstone, 1908; *Practical Irrigation: Its Value and Cost*, by A. J. Bowie, 1908; *Irrigated Lands of United States, Canada, and Mexico* by C. R. Price, 1908; *Farmers' Cyclopedias of Live Stock*, by E. V. Wilcox and C. B. Smith, 1908; *Mushrooms, Edible and Otherwise*, by M. E. Hard, 1908; *First Principles of Soil Fertility*, by A. Vivian, 1908; *Progressive Poultry Culture*, by A. A. Brigham, 1908; *Southern Poultry Guide, or Forty Years with Poultry*, by C. Hesselman, 1908; *National Standard Squad Book*, by E. C. Rice, 1908; *Breeding for Squabs*, by F. A. Sotter, 1908; *North American Trees*, by N. L. Britton and J. A. Shafer, 1908; *Ventilation for Dwellings, Rural Schools, and Stables*, by F. H. King, 1908; *Wheat Fields and Markets of the World*, by R. E. Smith, 1908; *The Book of Wheat*, by P. T. Dondlinger, 1908.

The leading secondary and elementary textbooks of agriculture, nature study and school gardening were the following: *Elements of Agriculture*, by G. F. Warren, 1909 (for secondary schools); *Agriculture for Common Schools*, by M. L. Fisher and F. A. Cotton, 1909; *Elementary Agriculture of Tennessee*, by K. L. Hatch, J. A. Haselwood, and C. A. Keffer, 1909; *Practical Agriculture*, by J. W. Wilkinson, 1909; *The Garden Book for Young People*, by Alice Lounsberry, 1908; *The School Garden Book*, by C. M. Wood and P. Emerson, 1909; *Nature Study*, by F. L. Holtz, 1908; *Nature Study by Grades*, by H. H. Cummings, 1908; *Practical Nature Study and Elementary Agriculture*, by J. M. and J. G. Coulter and Alice J. Patterson, 1909; *Notes on Drainage*, by E. R. Jones, 1908.

AGRICULTURAL EXPERIMENT STATIONS. Efforts to bring the results of experimental work in agriculture more directly home to the farmers have notably increased. Additional substations to study local problems were established in Arizona, Arkansas, Idaho, and South Carolina, and those already existing in many other States were given increased support. In Wisconsin the station has undertaken demonstration work on the farm of a State insane asylum, and similar arrangements have been made in Ohio and other States on the farms of various public institutions. In Kansas and Missouri provision was made for county

demonstration farms under station supervision. The dissemination of information through agricultural experimenters' unions made up wholly or partially of former agricultural students was continued in Nebraska, New York, Wisconsin and Rhode Island. The Massachusetts, Michigan, New Hampshire, Cornell, Oregon, Virginia and Washington stations were added to those issuing popular circulars or bulletins. The North Dakota and Wisconsin stations began to issue press bulletins and the Connecticut State Station distributed "post-card bulletins." This movement is to a large extent mingled with the general movement for the establishment of extension departments in the agricultural colleges. See AGRICULTURAL EDUCATION.

Under existing circumstances the Federal funds given to the stations are very apt to become involved in extension work, and the Office of Experiment Stations has found it desirable to rule definitely against the use of these funds for extension purposes. On the other hand, the strictly scientific work of the stations has been greatly expanded under the operations of the Act of Congress of March 16, 1906 (Adams Act). This is illustrated by the fact that more than sixty projects in the breeding of plants and animals have been undertaken under that Act. These include some large projects dealing with underlying principles or methods, and systematic studies of phenomena connected with efforts to secure improvement of breeds of types, as well as investigations more definitely aimed to secure varietal improvements. Inasmuch as many of the Adams fund projects require long-continued investigations, it will require much patience on the part of both investigators and the public to persevere until the desired results are accomplished.

A better medium than the ordinary station bulletin or report for the publication of the scientific work of the American stations has long been desired. The present mixture of scientific and popular material, compilations, inspection tests, and analyses becomes more confusing and unsatisfactory to farmers and scientists alike as the mass of station publications increases. The practice is rapidly growing of publishing accounts of the scientific work of our stations in a great variety of scientific journals at home and abroad. Such scrappy and scattered publication gives a very inadequate record of what the stations are doing in advancing knowledge and produces very little impression of the real services of our stations as public scientific institutions. The Association of American Agricultural Colleges and Experiment Stations has taken this matter up and after careful consideration through committees has decided to ask Congress to endow a journal of agricultural research, to contain original technical reports of the scientific investigations of the stations. The plan involves coöperation between the Department of Agriculture and the Association and the management of the journal by a board of experts designated by the Association and approved by the Secretary of Agriculture.

The annual number of changes in the personnel of the stations continues to be too large for the best interests of their work. Returns for 1909 show that 150 members of the scientific staff resigned or retired during the year. Of these, 3 were directors, 43 heads of departments or in charge of special lines of

work, and the rest assistants of various grades. In many cases the change was from one station to another, but a considerable number dropped out of station work. Two hundred and sixty-five new appointments were made, over 200 being men new to station work. The total number of persons engaged in scientific work in our stations is 1234, as compared with 765 five years ago. At present 120 of the scientific station workers hold the degree of doctor of philosophy, 45 have degrees in veterinary medicine, and nearly 300 have the master's degree.

The American stations have lost one of their early leaders through the death of Dr. Samuel William Johnson (q. v.), former director of the Connecticut Station. Dr. E. W. Hilgard, director of the California Station for thirty years, who became emeritus several years ago, retired in 1909, under the Carnegie Foundation, at the age of 76. He was also a leader in the national movement for experiment stations. His reputation as a scientific man rests especially on his extensive and long-continued studies of the soils of arid regions, and his work for the Tenth Census on the soils of the cotton-growing States. He summed up his life's work in a book on soils, published in 1906.

Agricultural experiment stations, maintained in whole or in part by Federal funds, now exist in every State and Territory, including Alaska, Hawaii, Porto Rico, and Guam. The total amount expended for this purpose during the fiscal year ended June 30, 1908, was \$2,800,047.29, of which \$1,152,000 was received from the national government. The remainder, \$1,648,047.29, came from the following sources: State governments, \$947,558.67; individuals and communities, \$22,835.30; fees for analyses of fertilizers, etc., \$186,159.70; sales of farm products, \$210,391.28; miscellaneous, \$281,102.34. In addition to this the Office of Experiment Stations had an appropriation of \$314,620 for the past fiscal year, including \$26,000 each for the Alaska, Hawaii, and Porto Rico experiment stations, \$5000 for the Guam experiment station, \$7000 for nutrition investigations, \$150,000 for irrigation and drainage investigations, and \$10,000 for farmers' institutes and agricultural schools.

In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York, and North Carolina, separate stations are maintained wholly or partly by State funds, and in a number of States substations are maintained. Excluding substations, the total number of stations in the United States is 61, of which 55 receive Federal funds.

The Office of Experiment Stations has completed the twentieth volume of the *Experiment Station Record*. The 20 volumes contain references to 71,650 articles in the world's literature of agricultural science. The publications of the American experiment stations abstracted in the *Record* number 7750, together with 3055 publications of the United States Department of Agriculture. The amount of literature to be reviewed in this journal has become so great that hereafter two volumes of the *Record* will be issued annually.

The office is also disseminating throughout the United States the practical results obtained at the several State experiment stations, through a series of farmers' bulletins under the general title of "Experiment Station Work,"

and the demand for these is so great that 900,000 copies were printed in 1909.

An exhibit of the work of the Office was made at the Alaska-Yukon Exposition at Seattle. For other work of the Office see AGRICULTURAL EDUCATION, FOOD AND NUTRITION, DRAINAGE and IRRIGATION.

In Alaska the new station at Fairbanks is being actively developed and 60 acres have been brought under cultivation. At the Rampart Station, $65^{\circ} 30'$ north latitude, 57 out of 65 varieties of grain fully matured in 1908, and practically every variety of spring grain ripened in 1909. Winter rye and wheat matured when the snow was not blown from the plats. The herd of Galloway cattle on Kodiak Island wintered satisfactorily with no shelter except an open shed, being fed exclusively on hay and silage from native grasses. The crossing of wild and cultivated strawberries at Sitka is giving very promising results.

The Hawaii Station has been very successful in growing Sea Island cotton and considerable areas of this crop are being planted. Experiments in tapping and coagulating rubber have been highly satisfactory and the profitableness of the rubber industry in Hawaii seems assured. Better varieties of rice have been developed and the yield greatly increased. Shipments of fresh fruit, particularly pineapples, are much larger.

In Porto Rico the station work has practically revolutionized the pineapple industry. Improved sugar cane seedlings introduced by the station are in great demand. High grade coffees from Arabia and Java are being introduced. Improved breeds of cattle, swine, sheep, goats, horses, and poultry are also being brought in.

The newly established station on the island of Guam has been equipped with land and small buildings. Maize, Kafir corn, Guinea grass and other forage plants are being introduced, preliminary to experiments with live-stock. Pineapples, bananas and avocados from Hawaii have been planted and other economic plants have been brought from Java.

The Chinese government has undertaken to develop agricultural instruction and research in Manchuria, and American agricultural experts have been made official advisers for this purpose. A director of agricultural instruction and experimental work has been appointed by the Mexican government. In Spain experimental work in agriculture has been begun near Seville and at Madrid and Motril under government auspices. An elaborate set of buildings for the sugar experiment station at Pekalongan, West Java, has been completed. A station has been established near Tucuman, Argentina. The system of Canadian stations has been enlarged by the establishment of experimental farms at Charlottetown, Prince Edward Island; Lacombe, Central Alberta; Lethbridge, Southern Alberta. In 1908 nearly 40,000 farmers in Canada coöperated with the stations in tests of new varieties of grain and potatoes. See UNITED STATES, paragraph on Department of Agriculture.

AGRICULTURE. The year 1909 was the most prosperous agriculturally of all years. The spring was late and the season was quite dry over large sections, but these conditions did not affect the total yield of staple crops

as greatly as was anticipated. The year was bountiful with most crops and prices were high. As a result the total value far exceeds that of all other years, amounting for crops and animal products to \$8,760,000,000. This is a gain of \$869,000,000 over the preceding year, and is practically double the value of ten years ago. Such gains demonstrate the remarkable development of the agricultural industry in the United States within a decade, and the part it now contributes to national wealth and business. According to a census of the American *Agriculturist*, completed at the close of 1909, the total number of farms in the United States has reached 6,730,000, a gain of nearly a million in the decade. In the Western States the increase has been 100 per cent. The value of these farms and their stock and equipment is placed at \$29,640,000,000, a ten-year increase of 44 per cent.

These figures are almost inconceivable without some means of comparison. The value of all crop products for the year 1909, estimated at prices on the farms, would make a half payment on the value of all the steam railroads in the United States, according to the valuation of 1904. The cereal crops alone, estimated as worth \$3,000,000,000 to the farmer, would be sufficient to pay for all the machinery, tools, and implements of the entire manufacturing industry in this country. Even the corn crop, which leads all other crops in value, nearly equals the value of the clothing and personal adornments of 76,000,000 people, according to the census of 1900; the gold and silver coin and bullion of the United States are not of greater value. This corn crop, as the Secretary of Agriculture says, "came up from the soil and out of the air in 120 days—\$14,000,000 a day for one crop, nearly enough for two *Dreadnoughts* daily for peace or war."

Cotton has now become the second crop in value, being followed in succession by wheat, hay, and oats. Compared with the average of the preceding five years, the year marked an increase in the yield of all the staple crops, except cotton, flaxseed, hops, and cane sugar. It was the highest in production of potatoes, tobacco, beet sugar, all sugar, and rice, and next to the highest in production of corn, oats, and all cereals; the wheat crop was the third largest harvested. Without exception every crop was worth more to the farmer than the five-year average. The value has not previously been equaled in the case of corn, cotton, wheat, oats, all cereals, potatoes, beet sugar, all sugar, flaxseed, and rice; the year was next to the highest for hay, cane sugar, and hops; and the value of barley was the third highest for that crop.

Compared with 1908, the year's gains in value of farm products were found all along the line, exceptions being barley, buckwheat, rye, and milk. The increase for cotton (seed and lint) was \$208,000,000, for wheat \$107,000,000, for corn \$105,000,000, for hay \$29,000,000, for oats \$22,000,000, for tobacco \$18,000,000, and for potatoes \$15,000,000. There were substantial gains in value of dairy and poultry products, and of animals sold and slaughtered. The price of butter has not been so high in many years, and the same is true of eggs and dressed poultry. The high prices of fresh meats and their products have become of such concern to nearly every family that an investigation into their

cause, their relation to agricultural production, and to the prices received by the farmers and stock raisers was conducted by the Department of Agriculture. (See Food AND NUTRITION.) This investigation failed to show that the farmer had received a share of the higher beef prices with regard to the raw animal. The slight increase he has received for his cattle is more than compensated by the higher price of corn. "The farmer gets some return for the high-priced corn that he feeds to his steers, but not a return equal to 60 cents a bushel, which is the price for the last two years. As for the unfed steer, it does not participate in the upward movement of prices in its farm value," which is barely that of 9 to 14 years ago. In the case of hogs the investigation showed that the farmer has fully participated in the rising prices, although it is apparent that during the last three years the price of corn has been too high relatively for the price of hogs.

It is generally recognized by those familiar with the subject that the beef supply of the country is not keeping pace with the growing demand. The heavy influx of settlers into the range territory are not handling cattle in any large way. The increasing demand for corn and wheat, with the consequent high prices, has induced stock feeders to plow up pasture lands and put in grain crops, which bring profitable cash prices. This has decreased the number of cattle marketed from the Middle West. The Department of Agriculture estimates the decline in visible supply of cattle the country over at 2,100,000 head. In view of the present situation the Beef Producers' Association of America has been organized by the national beef breed associations, for the purpose of educating the farmers into an understanding of the profits to be made in breeding and feeding cattle, and the consumer into a better knowledge of the beef carcass and its utilization.

The value of agricultural exports for 1909 was \$903,000,000. This was \$151,000,000 below the highest record, in 1907, and \$114,000,000 below the next highest, in 1908. Compared with 1908, the prominent decreases were \$11,500,000 for live animals, \$26,000,000 for packing-house products, \$20,000,000 for cotton, \$55,000,000 for grain and grain products, and \$3,800,000 for tobacco. The importations of agricultural products, on the other hand, were never so high in value as in 1909, amounting to \$637,000,000. The principal gains were in silk, wool, packing-house products (mostly hides), coffee, and sugar. The net balance of foreign trade in agricultural products in favor of this country was \$266,000,000, the lowest amount since 1896. The balance of trade in products other than agricultural was \$46,000,000 in favor of the United States.

The crop season in England was remarkable for the amount of rain and the extremely low temperature. The wheat crop was above the average, but was harvested with difficulty. The potato crop was considerably affected, but other root crops less so. In Canada the wheat yield was a bumper crop—168,386,000 bushels, or over 43,000,000 bushels more than the previous year. There were also material gains in the leading grain crops, due to the extension of the area and to good growing conditions during the season. The world's wheat harvest for

1909 is estimated in Liverpool at 3,346,968,000 bushels, which is an increase of 9½ per cent. over the production of 1908, and the highest record for total yield. The whole season in Argentina was one of the most protracted droughts ever experienced in that country. This led to a great falling off in the area of wheat sown, and to great losses of cattle and sheep. In many districts 20 per cent. of the sheep and 10 per cent. of the cattle are reported to have been lost. The spring and early summer were unfavorable for the growth of grass in Germany, and the hay crop was quite short. Argentina has in the past been looked to for supplying such shortage. The hop crop in Bohemia is estimated at about 7,716,100 pounds, or less than one-fourth of the 1908 crop, which was an unusually large one. The failure was due to cold, wet weather. The coffee crop of Brazil is reported as extraordinarily large, being estimated at 11,000,000 bags. Some half million bags were carried over from 1908, and the surplus for 1909 is placed at fully 2,000,000 bags.

The year was satisfactory to the wool-growers of Australia, although the outlook was unpromising when the season opened. Australia exported 582,016,428 pounds of wool during the year, and New Zealand 174,573,735 pounds, the total being an increase of 230,000 bales over the preceding year. The wool clip of Victoria for the season was 68,930,200 pounds, a decrease of about 10,000,000 pounds as compared with the previous year. On account of prevalence of foot-and-mouth disease in Argentina, the British ports have been closed against cattle and sheep from that country, even for slaughter. The disease is reported to have been practically stamped out, but it is spreading alarmingly in Brazil in the provinces bordering on Argentina. Considerable interest has lately been displayed by cattle-breeders in Brazil in the improvement of their stock. Shows have been held in agricultural centres, and the importation of good animals for breeding purposes is being encouraged by the government through the remission of the import duty. Meat has been added to the diet of the Japanese army, and a commission has been appointed by the Japanese Department of Agriculture to visit foreign countries for the purpose of gathering information to serve as a basis for the promotion of stock-raising in Japan. In Queensland a syndicate has been formed to float a company with a nominal capital of half a million dollars to take up some 700 square miles of land suitable for horse-breeding, with a view to supplying remounts for the army. For a long time the Australian horse has been much used in India for remount purposes. Six hundred Queensland horses were last year secured for use by the army in the Philippines, where they are reported to have given great satisfaction.

The government of Brazil is taking every available means to develop wheat growing in that country, where it is said to have once been so successful that wheat was exported. Under authority granted by the last Congress, subsidies for a period of five years are being offered to syndicates organized for wheat growing, and also for the establishment of flour mills for milling wheat grown by these syndicates. A bounty of \$6000 a year for five years is offered to syndicates which combine to establish experiment stations for the study of wheat growing, the

control of enemies, etc. There are also provisions for the free importation of tools, implements, and machinery for wheat growing and milling, a reduction of freight rates on wheat and flour produced in the country, and preference for such products in granting government contracts.

Experiments in dry farming on the American plan are to be undertaken in Australia. Considerable quantities of grains which have proved adapted to dry lands in the United States have been secured for experimental planting and distribution; and information in regard to American methods has been collected. There are thought to be large areas in that country adapted to dry-land agriculture.

The new United States tariff permits the importation, duty free, of all articles grown or produced in the Philippine Islands which do not contain foreign materials to the value of more than 20 per cent. of the total value. Rice is excepted from this new provision, and the free importation of sugar is restricted to 300,000 gross tons in each fiscal year, and of tobacco to 300,000 pounds of wrapper tobacco, 1,000,000 pounds of filler tobacco, and 150,000,000 cigars.

The formation of a stock company, capitalized at \$1,000,000, is on foot in Germany, to manufacture mowing machines and reapers to take the place of those now supplied by the United States. The value of the imports of these and other agricultural implements from the United States amounted in 1908 to over \$2,000,000.

A significant feature of the year was the attention given in published articles and addresses to the problem of the future food supply in its relation to our agriculture. Perhaps the widest publicity was given to President James J. Hill's address before the Bankers' Association, enlarged and published in *The World's Work*. In this Mr. Hill set forth in striking terms the growth of our population and the present limits of wheat production, and predicted a shortage of no less than 400,000,000 bushels by the middle of the present century unless radical improvements in the prevailing methods of farming are speedily begun. The growth of population in the United States from 1880 to 1908, he pointed out, was 74 per cent., while the increase in production of wheat for that period was only 41 per cent.; i. e., "the home demand for wheat has grown 80 per cent. faster than the supply." The low average yield for the whole country (13.88 bushels per acre) was used as an argument for more intelligent, efficient and productive methods, and for conserving the fertility of the soil. The practical instruction of the farmer and his sons, and the promotion of agriculture and farm life were urged in vigorous terms. The simple principles laid down for improvement were that (1) the farmer must cultivate no more land than he can till thoroughly, (2) there must be rotation of crops, and (3) there must be soil renovation by fertilizing, i. e., by keeping stock in connection with grain farming.

More optimistic was the address of the chairman of the Agricultural Subsection at the meeting of the British Association in Winnipeg last summer. In this Major P. G. Craigie, of the British Board of Agriculture, while recognizing the increasing population to be fed, saw

in the development of new areas, of more intensive methods, and of improved varieties of wheat, relief from immediate alarm for the bread supply. He cautioned, however, against treating the land as if it were "a mere wheat mine to be exhausted in all haste and without regard to its permanence and its future development," and urged more careful tillage and diversification.

Dean Davenport, of the University of Illinois, in a public address emphasized the fact that the agriculture of the future must be enormously productive in order to feed the teeming millions at the end of the present century. These conditions of population and demand will not be temporary, but permanent, and must accordingly be met by a permanent agriculture—a thing the world has never yet succeeded in establishing. No race, he said, has ever yet learned to feed itself except at the expense of the fertility of its own or some other country; and he prophesied that in the near future there is to be a struggle for land and the food it will produce such as the world has never yet beheld. As a consequence "we must devise and establish a permanent agriculture or go down in the attempt." A similar line of thought was followed by President J. L. Snyder in his address before the Association of American Agricultural Colleges and Experiment Stations, but with special emphasis on the social significance of a straitened food supply.

Dr. H. P. Armsby, of Pennsylvania, in a presidential address before the Society of Animal Nutrition, considered the future food supply from the standpoint of the amount of energy which could be stored up by the sun in the form of food products. This absolutely limits the density of population which a country can support from its own resources. As a means of conserving the products especially suited to human food, he pointed to the more general and efficient use of by-products of plant growth by feeding them to superior grades of live-stock. At present these by-products, such as straw, corn stover, etc., are not being utilized to the greatest advantage, and, furthermore, products suited to serve as human food, like corn and cereals, are now being fed to live-stock, although their roundabout conversion into human food through the animal is demonstrated to be very wasteful.

The Commission on Country Life, appointed by President Roosevelt in the fall of 1908, completed its inquiry and prepared a report early in the past year, which was transmitted to Congress and printed by it.

The Commission found that while in a general way the American farmer was never more prosperous or better off than at the present time, "agriculture is not commercially as profitable as it is entitled to be for the labor and energy that the farmer expends and the risks he assumes," and that "the social conditions in the open country are far short of their possibilities." The farmer's capital is small, the volume of his business is usually limited, and he stands practically alone against organized and syndicated interests. The country districts lack good roads for communication to relieve isolation and enable the economical and timely movement of products, and adequate and properly directed schools, which should be related to the daily life of the people and direct the rising generation to the country rather

than to the city. Education and good roads were the two most frequently mentioned needs in the hearings of the Commission. The Commission regards the development of a fully serviceable highway system as a matter of national concern. The first thing necessary is to provide expert supervision and direction, and develop a national plan.

It also urges that the farmer should have the privilege of purchasing where he can buy the cheapest and of selling advantageously, both of which would be promoted by well-directed coöperative enterprises and by a parcels post. Effective coöperation among farmers is strongly urged, to put them on a level with the organized interests with which they do business; and examples of successful coöperation are cited as illustrating the feasibility and advantage of this plan. The shortage of labor is another serious drawback to life in the country, affecting both the farmer and his wife. There is a lack of institutions and incentives that tie laboring men to the soil. In many parts of the country there is no adequate system of agricultural credit, whereby the farmer may readily secure loans on fair terms. Reliable savings institutions are also often lacking, which leads to the advocacy of postal savings banks.

The Commission called attention forcibly to the lessening productiveness of the land, and the effect of this on the material and social welfare of the farming people. It characterized the farming in this country as largely exploitative, consisting in mining the virgin fertility. "The lessening of soil fertility is marked," the Commission says, "in every part of the United States, even in the richest lands of the prairies. It marks the pioneer stage of land usage. It has now become an acute national danger, and the economic, social, and political problems arising out of it must at once receive the best attention of statesmen."

The deficiencies of country life are recognized by the people. A more or less serious agricultural unrest was found in every part of the United States, even in the most prosperous regions. There is a widespread tendency for farmers to move to town, to secure either better social advantages or better schools for their children. All this tends to sterilize the country and to lower its social status. Rural life, socially and otherwise, is not organized as it should be. The ultimate need of the open country is the development of community effort and social resources.

The Commission advocates the establishment of nation-wide extension work, which should carry information and advice directly to the farmer and his family, assist in the redirection of schools, and aid in the establishment of social and business organization. The great need everywhere of new and young leadership is strongly emphasized, and the Commission makes an appeal to all young men and women who love the country to consider this field and the opportunities offered in determining their careers.

One of the most important results of this inquiry was in demonstrating clearly the extent and character of the country life problem; and equally important was the pointing out of the fact that the time has now come for exact and comprehensive studies of the economic and social conditions of agriculture and of agricultural communities.

Much of the effect of this inquiry was lost by the failure of Congress to make any provision for continuing the work, as was urged by the President. The interest aroused in this movement has been kept alive, especially in the West, through the agency of the press. A Southwestern Interstate Country Life Commission was formed at a meeting in Guthrie, Oklahoma, in May; and a Country Life Day was observed at the National Apple Show, in Spokane, late in the fall. At the meetings in connection with the latter the appointment of a joint commission from the States of the Pacific Northwest was decided upon, and Oregon has led off in the appointment of the members of the commission for that State. In view of the interest in the report of the Roosevelt Commission, and the comparatively small edition in which it was published, the Spokane Chamber of Commerce has voluntarily reprinted the report at its own expense.

The United States Immigration Commission, appointed by Congress two years ago, has been conducting inquiries into the condition of colonies of foreign immigrants in various parts of the country. This inquiry has extended to all classes of foreigners engaged in farming in any of its branches, either as owners or renters, and has been directed to determining their success or failure, acquisition of property, extent to which they embrace American institutions, relations to the criminal classes, etc. A large amount of data on the agricultural colonies has been collected, which is being prepared for publication.

The discussion of abandoned farms has seemed to centre of late on New York State. The decline of farming in certain parts of the State has been the subject of several articles. The cause is attributed to cases of individual shiftlessness (which receive undue prominence), soil deterioration in some instances, bad roads, and social isolation. The State statistics are said to show about 20,000 vacancies on farms, and that these are being taken by foreigners. At the suggestion of the Commissioner of Agriculture of New York, Professor L. H. Bailey prepared a pamphlet on the agricultural situation in New York, in which he insists upon a higher rating for agriculture among human occupations, urges more faith in the land, and calls for a just appreciation of what the State possesses in the way of agricultural land and making the most of it. He believes there are as great opportunities for agriculture in the East as in the West, and suggests a campaign of publicity in respect to the agricultural possibilities of the State. Instead of continuing to dwell on the discouraging features of farming, the good side should be set forth, and "every time we describe one abandoned farm we ought to describe three well-occupied farms."

Speaking on this point recently, the Secretary of Agriculture referred to the shifting of the agricultural population into new regions, with its consequent influence on agriculture in the East. "The result has been," he asserts, "that some of the most fertile lands in our Eastern States—some of the most fertile lands of the world—have been left in a condition of practical if not actual abandonment, and the price of provisions has increased for the simple reason that there are not enough people actually to work the soils and to raise the

crops necessary to feed the non-producing population of the cities."

The Boston Chamber of Commerce has indicated its interest in agriculture by the appointment of a permanent committee on that subject, which has issued a very optimistic report upon the future of the New England farm. It points to a most advantageous market and lands cheap and plentiful which await the application of improved methods, energy, and determination, such as have enabled a high standard to be set in manufacturing.

In France a congress for the discussion of rural depopulation was held in June, 1909. It was shown that in 30 years the number of land-owning laborers had diminished from 1,134,000 to 589,000, and that there had been a great falling off in the number of small village merchants and tradesmen. The cause of rural depopulation was assigned to poor returns from the land, difficulty in securing farm help, and indifference of capitalists to investing money in rural districts. The system of training which turns the young people to commercial and professional careers, and the small size of the French peasant families at present were also cited as contributory causes. To meet this condition, practical training in agriculture, the employment of more farm machinery, the improvement of the economic and social status of the laborers, and the employment of married people on farms were among the remedies advocated.

In Germany, rural depopulation is causing much anxiety on account of the ever-increasing scarcity of agricultural laborers. Higher wages and better home surroundings for farm laborers are suggested as the only remedy. The shortage of adequate labor is leading to the suggestion of changes in farming systems to minimize labor and make the labor more productive.

In Switzerland a new law has gone into effect with relation to the splitting up of farms. The effect of the quite general custom of inheritance, under which the sons and daughters share equally in the real estate, has been to subdivide the farms into small parcels. The new law provides for keeping the property intact, and for its operation by the eldest son or other heir most competent to conduct the farm to the best advantage. By retaining the farms in the hands of the children who have been trained in agricultural pursuits, it is believed the youth will be kept on the land and the families of Swiss peasants held more intact.

Returns of the Board of Agriculture of Great Britain show a falling off from year to year in the area under cultivation. There are nearly one and a half million acres less under cultivation at present than ten years ago; and in thirty years there has been a shrinkage of 2325 in the number of small holdings (farms of 50 acres or less). The small holdings law, which went into effect in 1908, was aimed to remedy this condition. It empowers the county councils to purchase or hire land, by confiscation if necessary, for the purpose of providing small holdings for persons who desire to lease. They are to ascertain the extent of the demand for allotments, and the extent to which it is reasonably practicable to supply this demand. During the first year of the operation of this act, 23,285 applications were received for 373,601 acres of land, and over 13,000 of these ap-

plications have been approved provisionally, calling for approximately 185,000 acres. Over 700 applicants have been supplied with holdings by landowners direct, mainly through the intervention of the councils. In most cases the demand has been for small tracts, which could be carried on in addition to other regular work, and but few have expressed a desire to purchase their holdings.

The Royal Agricultural Society of England this year offers prizes, amounting to about \$2500, for the best managed farms in four classes, conducted by tenant farmers in Lancashire and Cheshire. As a partial solution of the problem of the unemployed in Great Britain, an extensive afforestation project has received considerable attention. It is estimated that 9,000,000 acres are available for the purpose, and that the annual afforestation of 10,000 acres would afford employment for 18,000 men temporarily and 1500 permanently, and would eventually yield a large revenue.

The movement for coöperative buying and selling is growing among farmers in the United States, and attempts are meeting with success. A potato exchange on Long Island, started last year, did a business of \$185,000 the second season on a capital of \$12,000. It handled about 300,000 bushels of potatoes for members, who averaged 10 cents a bushel nearer the New York quotations than when sold through middlemen. It also handled 1600 tons of fertilizer and large quantities of Paris green. A recent report on agricultural coöperative societies in Germany shows that there are 22,317 such societies at present, a gain of over a thousand within the year. Nearly 15,000 of these are agricultural credit societies, the remainder being for the purchase and sale of supplies, operation of creameries, and miscellaneous enterprises. Credit societies for farmers have been organized in India, loaning money at 12 $\frac{1}{2}$ per cent. as compared with prevailing rates of 37 to 75 per cent., or even higher. In France the courts have decided that agricultural associations do not come under the head of coöperative societies, and can not carry on their mutual insurance and credit business under the laws relating to coöperative societies. The third National Congress of Agricultural Credit, held at Montpellier the past year, urged that laws be passed removing this limitation.

The Agricultural Bank of the Philippine government, recently organized, has over 1,000,000 pesos to loan to farmers at 10 per cent. per annum. A new law has been passed in Prussia, which has a direct relation to agriculture, in the leasing of farms, renewals, sales of products, etc. This law imposes a stamp tax on all verbal or written contracts relating to transfers, leases, mortgages, notes of indebtedness, deferred payments, etc. It is a revision of a law of 1895, but differs in applying to verbal as well as to written transactions.

MEETINGS AND EXPOSITIONS. A land and irrigation exhibition was held in Chicago for two weeks, beginning the latter part of November. From the standpoint of attendance it was one of the most successful exhibitions ever held in Chicago. While the representation was nationwide, it was largely an irrigation show, but some sections of normal rainfall made convincing demonstrations of an agriculture that comprehended grain and fruit, and the drained swamp lands pictured their own story. The

surprisingly large attendance, comprised mainly of city folk, reflected the interest aroused of late in country life and small farming among town people.

The tenth International Live-Stock Exposition, held in Chicago, November 27 to December 4, was accounted the largest and best show ever held. The entries numbered 3908, filling all available space, and in most classes the quality of stock was superior to that of previous years. The prizes offered aggregated \$75,000. Nearly all sections of this country were represented, together with numerous exhibits from Canada and other foreign countries, including for the first time an exhibitor and prize winner from Argentina. The grand champion of the show, a pure-bred two-year-old Angus, was exhibited by the Kansas Agricultural College, which purchased the animal a year ago and prepared it for exhibition. A steer exhibited by the same institution also won the reserve championship.

The fourth National Dairy Show was held this year in Milwaukee instead of at Chicago, where the former exhibitions occurred. The attendance was exceptionally good throughout, and the educational features of the exhibits were particularly strong. The fourth International Dairy Congress convened at Budapest, June 6 to 11. Over one thousand delegates were present. The programme included many excursions to typical dairy farms and milk depots, and there was an extensive exhibit of dairy products and machinery. Stockholm has been selected as the place of the next meeting of the congress, in 1911.

The Annual Dairy Show of the British Dairy Farmers' Association, at London, early in October, showed the progress made in that industry since the collapse of wheat prices led farmers to look to other branches of farming, and especially to the sale of milk. The third National Corn Exposition, at Omaha, December 6 to 18, surpassed the two previous shows in every department. The attendance was large. The champion exhibit of ten ears was sold at auction for \$335. In addition to corn, there were exhibits of all kinds of cereal grains, and a demonstration of the milling and bread value of different varieties of wheat.

The Dry Farming Congress met the past year at Billings, Mont., and the first Conservation Congress met at Seattle, Wash., August 26 to 28. The latter congress dealt largely with irrigation, dry farming, soils, transportation and other economic questions. The Apple Show, at Spokane, Wash., has now become an annual feature, and serves to attract much attention to the industry of apple-growing, as well as to stimulate effort in that direction. A New England apple show, held for the first time this year in Boston, was a marked success in demonstrating the high grade of fruit grown in New England and the possibilities of the industry.

In England, the Royal Agricultural Society's show was held at Gloucester the last of June. Bad weather seriously interfered with its success. The total attendance for the five days of the show was about 90,000 people, which is much below the average. The show was a notable one for the excellence and representative character of the display of live-stock. An international conference of sheep-breeders, at Gloucester, England, June 21, 1909, was the tenth conference of this sort, and was a representative gathering.

The sheep show at Sydney, Australia, has come to be considered the world's greatest exhibition of fine wools. The past year it eclipsed the best records of previous years for the even character of the exhibits.

Preparation is being made for holding an international agricultural exhibition in Buenos Ayres, June 3 to July 31, 1910, under the auspices of the Argentine government.

AHMED MIRZA. From July 16, 1909, Shah of Persia. He was born about twelve years ago and is the second son of Mohammed Ali, and the seventh of the Kadjar line of ruling princes. Although not the eldest son, he was nominated by his father Valiabd, or heir apparent, because the mother of his elder brother was not of the Kadjar or royal line. For details of the events leading to his accession to the throne, see PERSIA, section *History*.

AIRSHIPS. See *AERONAUTICS*.

ALABAMA. One of the South Central Division of the United States. It has a total area of 51,998 square miles, of which 719 square miles are water. The population in 1900 was 1,828,697. According to a Federal estimate, made in 1909, the population was 2,112,465. The capital is Montgomery.

MINERAL PRODUCTION. The two chief mineral products of the State in both amount and value are coal and iron. The State ranks third in the production of iron, and according to the reports of the United States Geological Survey there were produced in 1908, 3,734,438 long tons. This was a decrease of nearly a million tons over the production of 1907, which was 4,039,453 tons. On account of the high prices received, however, the value of the iron mined in 1908 was \$4,358,902, but little less than the value of the product for 1907, \$4,863,129. It has been estimated that the resources in the iron ore district of Birmingham amount to about 340,000,000 tons. But a small part of the iron in the State has therefore been mined as yet. In many portions of the State where iron is known to exist no attempts have been made as yet to mine the ores. Alabama ranks fourth among the States in the production of pig iron. There were produced in 1908 1,397,014 long tons, a slight decrease from the product of 1907, which was 1,686,674 tons. There were on January 1, 1905, 51 blast furnaces in the State. Of these 26 were out and 25 were in. The ability of manufacturers in the State to make cheap iron is shown by the fact that the output of Alabama was 17 per cent. less than in 1907, while in Illinois the per cent. decrease was 31, in Virginia 33, Pennsylvania 38, Ohio 45, Maryland and West Virginia 65, while the average for the entire United States was 38.2 per cent. The State ranks fifth in the production of coal, being surpassed only by Pennsylvania, Illinois, West Virginia and Ohio. There were produced in 1908, according to the reports of the United States Geological Survey, 11,604,593 short tons, having a value of \$14,647,891. The effect of the general business depression was shown by a decrease of 2,645,861 short tons, or 18.47 per cent., in quantity and of \$3,757,577, or 20.42 per cent., in value as compared with the output of 1907. Nearly half the decline in production was in the quantity of coal made into coke, this item having decreased from 4,973,296 short tons in 1907 to 3,875,701 short tons in 1908. The prices of

coal were fairly well maintained during the year, the average price per ton showing a decrease of only 3 cents or from \$1.29 in 1907 to \$1.26 in 1908. The total number of men employed in the mines was 19,197. The number of mining machines in operation was 197, the same as in 1907. Some labor difficulties arose over an attempt to strengthen the mine workers' organization in Alabama, when the President of the United Mine Workers, on June 30, 1908, declared a strike of all the union mine workers in the State, to take effect July 6. The strike was not successful, and on August 31 it was officially called off. It was estimated that the original coal supply of the State before mining began was 68,903,000,000 short tons. Of this amount, up to the beginning of 1909, 176,338,903 tons had been mined. Alabama ranks third in the production of coke, being surpassed only by Pennsylvania and West Virginia. The coke production has decreased from 1905. There were produced in 1908, 2,362,668 tons, as against 3,022,794 tons in 1907, and the value of the production fell from \$9,216,194 in 1907 to \$7,169,901 in 1908. There were 45 coking establishments in the State in 1908, an increase of two over 1907. The total number of ovens increased from 9989 to 10,103. Of the 45 establishments, 10, with a total of 1885 ovens, were idle during the year. There were no new ovens building at the beginning of 1909. The establishments include two by-products recovery plants, with a total of 280 ovens, all of which were operated during the year. Clay products of considerable value are produced in the State. In 1908 the value of these products was \$1,559,808 as compared with \$1,754,409 in 1907. There were produced in 1908 1,933.44 fine ounces of gold, valued at \$41,208, and 282 fine ounces of silver, valued at \$149. No copper ores or pyrite ores were mined in Alabama in 1908. Other mineral products of the State are lime, limestone and graphite. (See COAL, PIG IRON, IRON, GOLD, SILVER, etc.) The value of the mineral products of the State for 1908 was \$35,010,808 as compared with a value of the product for 1907 of \$52,136,749.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the chief crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 43,646,000 bushels, from 3,233,000 acres, valued at \$37,099,000; winter wheat, 1,029,000 bushels, from 98,000 acres, valued at \$1,338,000; oats, 4,455,000 bushels, from 270,000 acres, valued at \$3,118,000; rice, 35,000 bushels, from 1000 acres, valued at \$28,000; potatoes, 1,360,000 bushels, from 17,000 acres, valued at \$1,333,000; hay, 166,000 tons, from 111,000 acres, valued at \$2,241,000; tobacco, 360,000 pounds, from 600 acres, valued at \$104,400. The corn crop which has been the chief feature in the agricultural development of the State in the last few years was somewhat smaller than in 1908, when the product was 44,835,000 acres. Cotton is the chief agricultural product of the State. The crop in 1909 was estimated at 1,017,826 bales, as compared with 1,332,003 in 1908. Since 1903 the value of the crop has greatly exceeded that of the years previous. The number of farm animals in the State has increased notably from 1900 to the close of 1909. The number in the latter year was as follows: Horses, 171,000; mules, 253,000; milch cows, 289,000; other cattle,

528,000; sheep, 178,000; swine, 1,176,000. The wool clipped in 1909 was 456,320 pounds as compared with a product of 466,240 pounds in 1908.

FISHERIES. The total value of the product of the fisheries of the State for the year ending December 31, 1908, was \$387,220. Of these products by far the most important was oysters. There were 536,300 pounds of oysters taken during the year, valued at \$168,870. Next in order of importance were red snappers, 2,635,200 pounds, valued at \$92,310; mullets, 1,655,500 pounds, valued at \$33,050; catfish, 323,000 pounds, valued at \$16,880; buffalo, 225,900 pounds, valued at \$10,370. Among other products of the fisheries were carp, redfish, drum, flounders, crabs and shrimp. The number of independent fishermen was 747, and 61 vessels were employed in the fisheries of the State.

EDUCATION. The school attendance in 1909 in the State was as follows: whites, 271,810; colored, 133,316; total, 405,126. There were 2164 white male teachers and 3984 white female teachers. The colored male teachers numbered 740, and the colored female teachers 1186. The total expenditures for the purposes of education during the year were \$2,562,641. This expenditure refers almost exclusively to work in the common schools, grades one to seven inclusive; a few schools, however, participating in this fund, did high school work. A law was passed in 1907 providing for a high school in every county. This carried with it an annual State appropriation of \$200,000, to aid in paying the salaries of teachers in high schools established under it. The State has made important progress in education in recent years.

FINANCE. The report of the State Treasurer for the year ended September 30, 1909, showed a balance in the treasury, September 30, 1908, of \$1,360,833. The receipts from October 1, 1908, to September 30, 1909, amounted to \$4,707,245. The disbursements during the fiscal year were \$5,309,908, leaving a balance in the treasury, September 30, 1909, of \$758,170. Of the receipts \$1,102,107 came from State taxes and \$1,352,260 from the special school tax of 1908. The largest expenditure was for education. For this purpose there was dispensed from the State treasury during the year \$1,975,455.

CHARITIES AND CORRECTIONS. Among the institutions under control of the State are the Alabama State Hospital at Tuscaloosa, the Alabama Schools for the Deaf, Dumb and Blind at Talladega, the Alabama Boys' Industrial School at East Lake, a reform school for white boys, the Bryce Hospital for Insane White at Tuscaloosa, and the Mount Vernon Hospital at Mount Vernon, for insane negroes, under the control of the Board of State Trustees. The State appropriates \$3.65 per capita per week for the maintenance and improvement of these institutions. For the Alabama Insane Hospital, the legislature appropriated in 1909 \$344,662; for the Alabama School for the Deaf, \$39,157; for the Alabama School for the Blind, \$20,930; for the Alabama School for Negro Deaf and Blind, \$11,500; and for the Alabama Industrial for White Boys, \$18,725. For the maintenance of prisons there was disbursed \$482,207.

POLITICS AND GOVERNMENT. There was no regular session of the State Legislature in 1909, as the regular sessions are quadrennial and the last was held in 1907. There was, however, an

extraordinary session held to pass a more stringent Prohibition law. The legislature of 1907 was elected on a local option platform and it passed a county local option bill. The counties which voted for Prohibition on their own initiative that year were under no-license on January 1, 1908. Among these counties was Jefferson, the largest and most populous county of the State, in which Birmingham is situated. The administration accepted this as a demand for still more Prohibition and the legislature was called in special session in 1908 and passed the so-called State-wide bill. This bill made the whole State dry by legislative enactment on January 1, 1909. Attempts were made to have this law declared unconstitutional in 1908 and 1909, but on April 6, 1909, the State Supreme Court declared the law valid. Flaws were found, however, in the State-wide bill, and early in 1909 the violations of the law were becoming notorious, especially in the cities. Locker clubs and other subterfuges flourished, and the conditions were little different from what they were under the open saloon. The flagrant violations and defiance of the law crystallized the sentiment for still more strict legislation, and an extraordinary session of the legislature was called in July, 1909, to meet the situation. The measure passed has been pronounced the most drastic Prohibition law ever enacted in any State. By this provision the State was given power to close up all places supposed to sell intoxicants. Any officer might enjoin or close up, the burden of proving innocence being upon the accused. Clubs were pledged to seek not to evade the law on penalty of loss of charter, and the possession of liquor was made *prima facie* evidence of guilt, and the defendant was presumed guilty until he could prove that he had not the liquor for an unlawful purpose. The right of trial by jury was denied. The laws included other measures, one of which prohibited any sort of liquor advertising, and threw every safeguard around the Prohibition law. Another provided for impeachment of officers who failed to put the law into effect. Still another was designed to prevent the sale of liquor in clubs. On September 22, in the inferior criminal court of Mobile, Judge Alford declared inoperative that section of the law which prevents transportation of liquor from one person to another. He declared that, in his opinion, the law, or that portion of it referred to, was not a reasonable exercise of police powers. This decision was a blow to the Prohibitionists, as it had prevented liquors from coming into the State in any large quantities. It was the most powerful weapon given them in the new bill. In addition to passing this measure, the legislature made provision for submitting to the people a constitutional amendment providing for Prohibition. This was designed to settle for all time the liquor question in the State. The election on this amendment was held November 29, and it was defeated by over 27,179 votes, probably the largest majority ever given against any measure or candidate in the history of the State. This result, however, is not to be taken as a distinct repudiation of Prohibition. Many Prohibitionists were opposed to putting Prohibition in the constitution because they maintain that Prohibition in Alabama is still an experiment, and that the experience thus far has not been such as to justify putting it into an organic law.

On October 6, Governor Comer made a remarkable attack in a newspaper interview, assailing Judge Thomas C. Jones of the United States Court for his action in deciding certain railroad rate cases against the State. He declared that it was generally understood that Judge Jones decided the cases before he heard the evidence, and that the belief was that he had informed the railroads beforehand what he was going to do. In an interview previously given, Judge Jones resented similar remarks made in a speech by Governor Comer, and this interview was given as the Governor's reply. Judge Jones later, in a public statement, denied the Governor's charges, using the words, "in language as vigorous as it is possible for a judge to use in the public print."

The legislature, on August 10, unanimously adopted a resolution ratifying the income tax amendment to the constitution of the United States. Alabama was the first of the States to ratify this amendment.

OTHER EVENTS. The sheriff of Mobile county was impeached on June 30, and his removal from office ordered by the Supreme Court of the State, because he permitted a mob to take a negro from the jail and hang him. At the time of the execution the grand jury acquitted the sheriff of blame, but a mass meeting of citizens condemned the action and petitioned the Governor to impeach the sheriff. This was the first case tried under the new constitutional provision of the State, which lays upon the sheriff the responsibility of protecting prisoners under his control. On February 2, seventeen men were killed by an explosion in the mines of the Birmingham Coal and Iron Co., at Short Creek. The explosion was caused by a windy shot. On January 18, Spring Hill College, the oldest Jesuit institution in the Southern States, was destroyed by fire. The buildings destroyed included the college chapel, exhibition hall, music room, college library, college museum and two dormitories. A severe tornado passed over Morgan county on April 1, killing several persons and causing much damage to property. During the year the \$2,000,000 terminal station at Birmingham was nearly completed and it was expected that the railroads would occupy it early in 1910. An important event in the railroad history of the State was the entrance of the Illinois Central into Alabama, with Birmingham as its terminus. By an enactment of the legislature the city of Birmingham took in a number of its suburbs on January 1, 1910. This gives the city a population of over 125,000. The United States Steel Corporation announced late in 1909 that \$7,000,000 had been appropriated for improvements on its Alabama properties during the next year. This will be devoted to getting the adequate water supply at Ensley, for industrial purposes.

OFFICERS: Governor, B. B. Comer; Lieutenant-Governor, Henry B. Gray; Secretary of State, Frank N. Julian; Auditor, W. W. Brandon; Adjutant-General, Bibb Graves; Attorney-General, A. M. Garber; Treasurer, W. D. Seed; Superintendent of Education, H. C. Gunells; Commissioner of Agriculture, J. A. Wilkinson; ex officio Commissioner of Insurance, F. N. Julian—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, John R. Tyson; Associate Justices, Jonathan Haralson, N. D. Denson, John C. Anderson, R.

T. Simpson, James R. Dowdell, and Thomas McClellan—all Democrats.

The State Legislature of 1909 was composed of 35 Democrats in the Senate, and 104 Democrats, 1 Republican and 1 Populist in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

ALAMOSITE. See MINERALOGY.

ALASKA. A territorial possession of the United States, whose government is as yet unorganized, situated at the northwestern extremity of North America. The total area, according to the revised survey of 1906, is 586,400 square miles. The population, which has remained practically the same during the past two or three years, is about 31,000, distributed as follows: First judicial division, 9000; second judicial division, with Nome as its centre of population, 7000; third judicial division, with Valdez and Cordova as centres of population, 7000; fourth judicial division, with Fairbanks as the centre of population, 10,000. The population in the placer mining camps has apparently passed the maximum and is at present declining in number. This decline is largely offset by an increase along the southern coast, where railroads to the Bering River and Matanuska Coal Fields and to the Chitina Valley are under construction. The population is engaged almost entirely in mining, railroad construction, and fishing, and occupations incident thereto. A few people are engaged in truck farming near the mining camps. The native population is approximately 35,000 and remains practically the same from year to year.

AGRICULTURE. An agent of the Department of Agriculture conducted experiment stations in various sections of Alaska in 1908-9. The result was, on the whole, satisfactory. Oats and wheat were fully matured at Rampart and in the Tanana Valley. The Manly Hot Springs in the Tanana Valley and the hot springs near Nome grow a large variety of vegetables and plants with success. Several promising experiments in raising cattle on the islands of the Aleutian group are being made. The government is experimenting with raising sheep and Galloway cattle on Kodiak Island. (See IRRIGATION.)

MINING. The total value of the mineral production of Alaska for the calendar year 1909 is estimated by the United States Geological Survey at \$20,200,000, as compared with about \$19,600,000 in 1908. The strikes and labor troubles which materially interfered with mining at the Treadwell mines in southeastern Alaska and in Fairbanks District in 1908 had no recurrence in 1909 and mining was conducted without embarrassment during the year. Gold is being successfully mined throughout the whole district. The development of recent discoveries of veins carrying high-grade ore has been very encouraging and there seems to be a revival of interest in gold quartz mining throughout southeastern Alaska. Discoveries of quartz carrying high values were made in the Fairbanks District, and a limited amount of development work was done with encouraging results. High-grade gold ores were discovered in the Kenai Peninsula near Moose Pass and on Willow Creek, and the best of these prospects are being developed. Placer mining continues in a small way in southeastern Alaska

and the beach at Cape Yaktag and at Cook Inlet. This character of mining continues throughout the Yukon Valley, and activities in the Fairbanks District continue unabated. Increased interest was shown during the year in prospecting in the Sushitna and Kuskokwim valleys, and encouraging reports are made of these districts. On the Seward Peninsula drift mining is giving way to dredging and hydraulic mining. Decreasing opportunities for the individual miner and prospector on the Seward Peninsula have been followed by an increase in the prospecting for lodes and veins carrying precious metals. Reports of promising discoveries along these lines have been made from time to time.

The increased demand for copper and its prevailing high price have attracted much attention to the copper deposits of Alaska. Three regions in the Territory give promise of making important contributions to the copper market: Prince of Wales Island, in southeastern Alaska, Prince William Sound, and the Copper River and Chitina River regions. The first two, which are near the sea, have produced copper for several years, but the third is still in the prospecting stage. During 1909, the low price of copper prevented much development, but the completion of the Copper River and Northwestern Railroad to the Chitina Valley, and the extension of the Alaska Central Railroad to the Matanuska Valley, and with a moderate increase in the price of copper, a renewed activity in prospecting and the development of copper mines may be expected.

The production of coal in Alaska is not yet considerable, although vast fields of coal exist in various parts of the Territory. Only between 300 and 400 square miles of coal-bearing rocks have been surveyed in detail by the United States Geological Survey, and the data in regard to the remaining 800 square miles, believed to be underlain by coal, are very meagre. It is estimated that the unsurveyed coal fields cover 12,000 square miles, but of these fields only the general outline is known, and they must be surveyed to ascertain how much of the area is underlain by workable coal beds. The mineral is found to be widely distributed throughout the district, and is found to be of a very high grade in the Matanuska and Bering River valleys. Deposits of coal are also to be found on the Seward Peninsula. As no titles to any coal fields in Alaska have been secured, development of the deposits has not been made. It is believed that when title to coal lands in the Bering River and Matanuska fields is given development will follow rapidly, as transportation seems to be assured to these fields. The opening up of the coal fields resulted in many charges of fraud in the attempt to obtain title, and these charges came to be an important feature in the administration of President Taft. A discussion will be found in the article UNITED STATES, paragraph *Administration*, and in the article PUBLIC LANDS. Small quantities of petroleum have been found in the territory east of the Copper River. Some wells have been opened, but oil in commercial quantities is not yet produced. Shipments of gypsum are made from Chicago Island and deposits of this mineral are reported in other parts of the Territory. Marble of various colors and quantities, which is found in various parts of the Territory, is being successfully quarried at Shakan on Prince of Wales Island, and the shipments

from the quarries during 1909 were materially increased. Discoveries of deposits of antimony are reported in the Nome and Port Clarence districts on Seward Peninsula, in the Kantishna country, in the Yukon Valley and in Cross Sound in southeastern Alaska. Graphite, bismuth, cinnabar, and talc have been found, but sufficient work has not been done to prove the value of any of these deposits.

TRANSPORTATION. The future development of Alaska depends very largely upon all-the-year-round easy communication between the coast and the interior, and this naturally depends upon transportation facilities. There are ample reasons to warrant the construction of railroads from the coast to the Bering River and Matanuska coal fields, and to the copper mines in the Alaskan range of mountains, but beyond this there is no present business to warrant capital unaided to construct railroads. A diversity of opinion of engineers as to the best route from the coast to the interior has led to some governmental experiments in railroad construction, without material progress. If a railroad is built to the Matanuska coal fields, it would establish a permanent community north of the coast range of mountains where men will have an opportunity to earn a livelihood throughout the year, and establish a base from which they can prospect for a radius of 100 or 200 miles. With the completion of the Copper River and Northwestern Railroad, and a summer communication to the Bonanza Mine, a large permanent camp will be established on the south slope of the Alaskan range of mountains, from which men can prospect for copper in this range of mountains and north to the headwaters of the White River, where very promising indications of copper are already known. On the Seward Peninsula, the Council City and Solomon River and the Seward Peninsula Railroads continued in operation during the year. The Copper River and Northwestern Railroad continued construction to the Copper River Valley. On July 25 this railroad began operating the first 55 miles of its route, extending from Cordova to a point above Abercrombie Rapids on the Copper River. By the end of 1909 it had completed about 105 miles of railroad. This company employed during the summer about 3000 men on construction and maintenance work. The Alaska Central Railroad, under the direction of a receiver, laid 21 miles of additional track during the summer, and has now 75 miles of the railroad completed. The Tanana Mines Railway continued to operate its road successfully from Chena and Fairbanks to the outlying creeks and mining camps.

COMMERCE. There was an increase in the commerce between the United States and Alaska during the fiscal year 1909. The value of domestic merchandise shipped from the United States to Alaska and merchandise shipped from Alaska to the United States was practically the same as in the year 1907. There was a falling off in the amount of merchandise shipped to the Bering Sea and Arctic Ocean and to the Yukon River. This decrease was overcome by an increase in the value of merchandise shipped to southeastern Alaska and to southern Alaska. The amount of gold shipped from Alaska to the United States in 1909 remained practically the same as in 1907 and 1908. The domestic merchandise shipped

from the United States to Alaska in the fiscal year 1909 amounted to \$17,186,445, as compared with \$15,957,576 in 1908 and \$17,811,093 in 1907. This merchandise was divided as follows: Coal, \$172,238; lime, \$611,110; hardware and machinery, \$4,812,280; provisions, \$5,730,895; liquors, \$740,667; and all other, \$5,119,255. The value of merchandise and precious metals shipped from Alaska to the United States in the fiscal year ending June 30, 1909, was \$34,335,435, as compared with \$31,766,044 in 1908 and \$37,537,676 in 1907. Of this the domestic merchandise, including salmon and other fish, copper ore, whalebone and furs, amounted to \$13,055,355; the domestic gold amounted to \$17,782,493 and the foreign gold to \$3,464,200. The imports of Alaska from other countries than the United States amounted in the fiscal year ending June 30, 1909, to \$647,331, of which by far the larger part came from Canada and from Asiatic Russia. The exports to other countries than the United States amounted to \$949,669, of which \$907,810 came from Canada.

EDUCATION. The people of Alaska have from the very beginning of its occupation showed an interest and pride in public schools, and during 1909 they were administered with gratifying results. Schools in the incorporated towns are supported largely by the license moneys collected within the towns, and are under the control of the school boards and town councils. During the year schools were successfully maintained at Chena, Douglas, Eagle, Fairbanks, Juneau, Ketchikan, Nome, Skagway, Valdez and Wrangell. In the schools established under the Act of Congress, commonly known as the Nelson Bill, 684 pupils were in attendance, as compared with 672 in 1908. The cost of maintenance of these schools was \$40,762. The government schools for the education of natives continue under the charge of the Bureau of Education, which during 1909 increased the number of its schools from 62 to 69. The number of pupils increased from 3067 during the fiscal year ending June 30, 1908, to 3725 for the year ending June 30, 1909. The efforts of this Bureau to increase the efficiency of the schools and to make them extend their influence to adults as well as to the children, has already begun to show very good results, and it is confidently expected that succeeding years will bring increased results from these expenditures. The Presbyterians, the Roman Catholics, the Moravians, the Methodists, Baptists, Episcopalians, Friends, the Swedish Evangelical, and the Orthodox Greek Church carry on educational work among the natives, with excellent results.

INDIANS. The educational work conducted among the Indians shows great progress. A strong effort is being made by the agents of the Bureau of Education to reach the physical needs of the natives and to improve their general physical condition. These efforts are making a decided change for the better. The Act of Congress approved February 6, 1909, made it a felony to sell intoxicating liquors to the natives. Under the provisions of this act, prosecutions against the violators of this provision were vigorously pushed during the year, and it is expected that this illegal traffic will be largely diminished.

NATIONAL FORESTS. The national forests of southeastern Alaska were extended in 1909. The administration of these forests continued

to conserve the timber and provide for its liberal use without hampering the general development of the country, and it has met with the general approval of the people of the Territory. The production of lumber was only for local uses during 1909, though small shipments were made from Ketchikan to points east of the Rocky Mountains in the United States. A large percentage of the standing timber within the forest reserves of southeastern Alaska is overripe and should be removed to make way for a new growth. There are two national forests, the Chugach, with an area of 11,280,640 acres, and the Tongass, with an area of 15,480,986 acres. During the fiscal year ending June 30, 1909, \$13,448 was received from the sale of timber from the national forests in Alaska.

FISHERIES. The total pack of the salmon canneries of Alaska for the year 1909 amounted to about 2,278,000 cases of 4 dozen 1-pound cans to the case. The experiment of hatching salmon fry continued during the year under the direction of the United States Fish Commissioner. Halibut fishing continued during the year, but suffered from the low price of halibut. A few vessels were engaged in catching cod, salting and taking them to San Francisco and Seattle for final preparation for the market. A plant for extracting oil and making guano from whales has been in successful operation at Tyee, Admiralty Island, for the past two years.

FURS. The value of the furs shipped from Alaska in 1909 showed considerable increase over the value of the shipment of 1908. The comparative figures were as follows: 1909, \$537,162; 1908, \$463,108.

CABLES AND TELEGRAPHS. The service rendered to the people of Alaska by the military cable and telegraph is excellent and highly beneficial. The land lines were strengthened, and the service is growing annually better.

POLITICS AND GOVERNMENT. On May 18, Walter E. Clark was nominated for Governor of Alaska to succeed Wilford B. Hoggatt, who had resigned. The problem of the organization and government of the Territory was brought before Congress, but nothing was done, although a bill was introduced on January 7, by Mr. Wickersham, the Territorial delegate, providing for a legislature of twenty-four members, eight Senators and sixteen Representatives. In response to a communication from the leading editors and mayors of the Territory, begging him to recommend to Congress an elective legislature for this Territory, the President replied that in his opinion Alaska was not yet fit for self-government in the form of a legislature. He declared himself willing to recommend that it should have the commission form of government similar to that of the Philippines.

For an account of the part taken by Alaska in the Alaska-Yukon Exposition, see **EXPOSITIONS**.

OFFICERS: Governor, Walter E. Clark; Secretary to the Governor, William H. Loller; ex-officio Secretary of Alaska, William S. Distin; Delegate to Congress, James Wickersham.

JUDICIARY: First Division, Thomas R. Lyons; Second Division, Alfred S. Moore; Third Division Edward E. Cushman; Fourth Division, P. D. Overfield. The Governor is ex-officio Superintendent of Public Instruction of schools outside incorporated towns, and for schools

maintained for children of white and mixed blood.

ALASKA - YUKON - PACIFIC EXPOSITION. See **EXPOSITIONS**.

ALBAUGH, JOHN W. An American actor and theatrical manager, died Feb. 11, 1909. He was born in 1837 at Baltimore, Md. He made his first appearance in that city as Brutus, in *The Fall of Tarquin*, in 1855, under the stage management of Joseph Jefferson. He appeared in many other parts, the best known of which was perhaps that of Louis XI, in the theatre in New York which later became Daly's Theatre. From 1868 until 1899 he was manager of theatres in St. Louis, New Orleans, Albany, Washington and Baltimore. In the latter year he retired from the stage. In his later years he maintained a famous stock farm near Washington, D. C.

ALBERT I. A Belgian prince, who on December 23, 1909, succeeded Leopold II. (q. v.), as third King of the Belgians. He was born in 1875, the only son of Count Philippe of Flanders, younger brother of Leopold II. He received a careful education and in 1900 married the Duchess Elizabeth, daughter of Karl Theodor, Duke of Bavaria, and Marie Joseph, daughter of Prince Miguel of Braganza. King Albert, who on his accession to the throne bore the title of Count of Flanders, is one of the most popular members of the reigning house of Belgium. He is a great traveler and a student of politics and economics. In 1898 he visited the United States and studied railroading under the guidance of James J. Hill. He made an extended visit to the Congo several years later, and upon his return to Belgium strongly urged the need of railroad development and of reform in the treatment of the natives. He is said to be adverse to pomp and display and to be profoundly interested in social questions. He has three children, Prince Leopold, aged 9, Prince Charles, aged 7, and Princess Marie, aged 4. In his speech at the time of his accession, King Albert, referring to the Congo State, said: "In the Congo the nation desires a policy of humanity and progress to be pursued. A colonizing mission can be but a mission of high civilization. Belgium has always kept her promises, and when she undertakes to apply a policy worthy of her in the Congo, nobody has a right to doubt her word." In relation to his conception of the duties of a king, he said: "The throne has certain prerogatives and certain responsibilities. The sovereign must be a servant of the law and the supporter of social peace. Before the country I take a pledge to do my duty scrupulously and to consecrate all my strength and life to the service of the Fatherland." See **BELGIUM**.

ALBERTA. A province of Canada (since September 1, 1905). It includes the former district of Alberta, the western part of Athabasca, and a strip of Assiniboia and Saskatchewan. The capital is Edmonton. The area is about 253,540 square miles (including about 2500 square miles of water). The population of the Territory now forming the province has increased rapidly, from 72,841 in 1901 to the estimated number of 300,000 in 1909. Free homesteads are available for thousands of settlers. The province is rapidly developing into a grain-producing region. For further statistical details, etc., see **CANADA**. See also **EXPLORATION**.

The provincial government consists of the Lieutenant-Governor, appointed by the Governor-General of Canada, of an Executive Council, or responsible ministry (four members), and of a unicameral Legislative Assembly (41 members, elected for five years). The Lieutenant-Governor in 1909 was George H. V. Bulyea (since September 1, 1905); the Premier (also Treasurer and Minister of Education) was A. C. Rutherford.

HISTORY. The final session of the first legislature opened in January, and Governor Bulyea, in announcing the government's programme, promised the introduction of bills for subsidizing the railways in the northern part of the province, for an increase of representation conforming to the increase of population, for redistribution of seats, for regulation of elections, the extension of the government telephone system, the co-operation of the government with the farmers in marketing their crops, and a bill for the protection of children. The government telephone system was established in January. As the result of a board of arbitration appointed under Secretary Lemieux the coal strike in Southern Alberta came to an end in May, and the miners resumed work on their old terms for a period of three years. Damage estimated at several million dollars was caused by prairie fires in October.

ALCOHOL. A general movement against the excessive use of alcohol was noticeable throughout most civilized countries in 1909. Statistics and a chart showing the consumption of alcohol and absinthe in France during 1907 have recently been published. The chart shows in a striking way the inequality of the consumption of alcohol in different districts of France. The greatest consumption occurred in a group of 21 departments, which, starting from Paris, embraces part of the northeast, north, and west of France, those departments producing large quantities of beer and cider. Seine Inférieure consumes nearly 12 litres per capita; while the consumption in the other portions of this group ranges from 4.06 to 9.11 litres per capita. The departments on the east and southeast consume from 2 to 4 litres per capita. In the centre, southwest, and a large part of the east of France, the consumption falls below 2 litres per capita. More alcohol is drunk in the towns than in the country, the proportion remaining the same according to the groups of the departments above indicated. It may be deduced from the statistics that the consumption of alcohol, but not of "absinthe," has greatly decreased, particularly in the towns. This is proved by comparison with figures for 1897 and 1907. Havre and Rouen, which head the list, have dropped from 19 to 15 and from 17.51 to 13.97 litres per capita; Paris from 7.95 to 3.45; Lyons from 5.73 to 2.59; Bordeaux from 4.52 to 2.75; Nice from 5.09 to 2.32; Toulon from 8.08 to 4.70; Montpellier from 5.27 to 2.27; etc. The reduction was noticeable in every district, and is to be attributed partly to increased taxation, which has led the liquor producers to reduce the proportion of alcohol in the liquor; in part to the town dues (*taxes d'octroi*) that have been imposed on alcohol; and finally, in part to the success of the anti-alcohol movement. The prohibition of alcohol in the barracks contributed to this result. During their term of compulsory military service young men are broken of the habit of drinking

alcohol, and drink less on their return to civilian life. The statistics, however, reveal an increased consumption of absinthe, particularly in the south, southeast, and east. Marseilles consumes 3 litres of pure absinthe per capita; while the departments of the north, centre, and west use less than 1 litre per capita.

A recent report of the League of Austrian Anti-alcoholists says that many teachers in the German and Slavic universities of Vienna, Prague, Cracow, Lemberg and Graz are recommending a non-alcohol plan of treatment in diseases such as pneumonia, erysipelas and septicemia, in which alcohol has hitherto commonly been used. Among the students, who still regard beer as indispensable at their meetings, the anti-alcoholic movement is constantly gaining ground, because it is thought, of the admission of women to the universities. The League has devoted large sums, thus far in vain, to the search for a substitute for beer. The national expenditure for alcohol beverages amounts to \$250,000,000 for a population of 28,000,000 in the Austrian part of the empire.

At the International Congress on Alcoholism held in London, Dr. Holischer of Karlsbad presented statistics from 47 hospitals, in 18 of which alcohol was used for pneumonia and typhoid fever on a plan of alternating treatment. That plan was adopted in order to secure the most reliable proof of the effect of alcoholic and non-alcoholic treatment. In 238 cases of pneumonia treated with alcohol the mortality was 24.3 per cent.; in 248 cases treated without alcohol the death rate was 21.3 per cent. In 47 cases in which delirium tremens counted as a complication alcohol was given to 21, of which 15 proved fatal, while in 26 cases treated without alcohol only 9 died. This apparently shows that there is no foundation for the prevalent idea that alcohol is necessary in inebriate cases. The author says that while no one would wish to hold alcohol responsible for the small difference between the percentage of 24.3 and 21.3, nevertheless the failure of alcohol as a curative agent was plainly shown. Out of 161 typhoid patients 80 were given alcohol, of whom 15 died; and 81 were treated without alcohol and 12 died. At the Congress Professor Laitinen, director of the hygienic institution in the University of Helsingfors, gave the results of experiments made to prove the influence of alcohol on immunity. He said it was a well established fact that alcohol weakened the normal resisting power of the body against the germs of disease. He made experiments on the blood of 223 persons, abstainers and non-abstainers, whose conditions of life were similar in other respects; and he concluded that alcohol in comparatively small doses had a prejudicial effect on the protective mechanism.

In Canada during the official year 1907-1908, were consumed 6,849,763 proof gallons of alcohol; there being consumed in the process of manufacture 7,679,000 pounds of malt; 72,997,000 pounds of Indian corn, 14,921,000 pounds of rye, 3,117,000 pounds of wheat, 395,000 pounds of oats, and 17,212,000 pounds of molasses. The province of Ontario produces the greatest amount of whisky, seven of the twelve distilleries in Canada being within her boundaries. While the increase in the production of spirits is small compared with that of beer, it is claimed that temperance sentiment is gaining, as is indicated by the great increase in the pro-

duction and consumption of beer. It is shown that from 1869 on there has been a steady decline in the use of spirits in Canada, from a per capita consumption of 1.124 gallons in the former year, to 0.889 gallons at the present time. The consumption of beer has, however, been steadily on the increase, having risen from 2.290 in 1869 to 5.812 gallons per head in the present fiscal year.

The rôle of alcoholic beverages as a cause of insanity has been accurately studied of late. Alcohol constitutes, next to heredity, the largest single or contributing factor in the production of lunacy. Of 520 new cases in the State Hospital for the Insane in Norristown, Pa., alcoholism appeared to be a factor in 46 per cent., 13.6 per cent. being actually alcoholic psychoses. In Manhattan State Hospital, New York City, a study of 961 cases in which the causation was accurately determined revealed that alcohol was the determining factor in 55 per cent. of the men, and 22 per cent. of the women, averaging 37 per cent. Massachusetts gives alcohol as the precipitating factor in 30.6 per cent., while a study by Rosanoff shows 26.3 per cent. in 3 English asylums, and 24.9 per cent. in Austrian institutions. See INSANITY; CHEMISTRY, INDUSTRIAL.

ALDRICH, NELSON WILMARHT. A United States Senator from Rhode Island, who as chairman of the Committee on Finance in the Senate, introduced the tariff bill of 1909 into that body (see TARIFF; UNITED STATES, paragraph *Tariff*). He was born at Foster, R. I., in 1841, and he was educated in the public schools and academies. From 1871 to 1873 he was president of the Providence Common Council. He was a member of the Rhode Island General Assembly in 1875-6, serving in the latter year as Speaker of the House of Representatives. He was elected to the House of Representatives of the 46th Congress and was reelected to the 47th Congress. On October 5, 1881, he was elected to the United States Senate to succeed Ambrose E. Burnside, Republican. He was reelected in 1886, 1892, 1898 and in 1905. His term of service expires March 3, 1911. Senator Aldrich, as chairman of the Committee on Finance, is the Republican leader of the Senate and is, without question, the most powerful member of that body. It was largely through his efforts that the tariff bill was passed in the form in which it exists. He opposed in general the attempt of the "insurgent" Senators to bring about a marked reduction in tariff duties. This action made him unpopular in those sections of the country, notably the Middle and Far West, in which the sentiment for radical lower revision was strong. Senator Aldrich, as chairman of the Finance Committee, was the head of the Monetary Commission appointed to introduce laws to improve and regulate the banking and currency. Following the completion of the tariff bill and adjournment of Congress, he traveled throughout the West making speeches in explanation of the proposed measures. See FINANCIAL REVIEW; CURRENCY; CENTRAL BANK, and other subjects dealing with finance and banking.

ALEXANDER, JOHN WHITE. An American artist, elected in 1909 president of the National Academy of Design. He was born in Allegheny City, Pa., in 1856, and received his art education at the Royal Academy of Fine

Arts, Munich. He has received many medals and prizes at home and abroad. In 1901 he was made a Chevalier of the Legion of Honor. He is a member of many societies of art, and is president of the McDowell Association. His pictures hang in the Luxembourg gallery and in many American and European collections.

ALFALFA. This remarkable forage plant continues to grow in favor and importance from year to year. Although the crop is difficult to establish on soils where it has never been grown, efforts to introduce and establish it are continued in many localities, especially in the Eastern States. Success is now being met with in New York, Pennsylvania and some of the New England States. The increase in acreage in the States in which the crop is quite generally grown is pointed out by the following data: In 1890 Kansas had 267,376 acres of alfalfa, in 1909 993,539 acres; in 1899 Nebraska had 115,142 acres, as compared with 547,557 acres in 1908; Oklahoma grew only 15,116 acres in 1899, but in 1908 the area had reached 130,236 acres; and Utah, which had 268,229 acres in 1899, now has over 300,000 acres. Colorado has about 500,000 acres in this crop. Kansas and Nebraska, the two leading alfalfa-growing States, even produced about 2,000,000 tons of alfalfa hay in 1909. Among South American countries Argentina, where fields of alfalfa several thousand acres in size are grown, is the leader in the production of this crop.

The experiment stations of the country, as well as the Department of Agriculture, continue their investigations with alfalfa for the purpose of assisting the farmer to reap its great benefits and to spread its culture to new localities. The Kansas experiment station has pointed out during the year that of the original stand of young plants after seeding a large percentage dies off, while the remaining plants make up for this loss by increasing in size and sending out more stems and shoots. An examination showed that 223 fully developed plants contained on an average over 28 stems per plant. Varieties of alfalfa are introduced and plant-breeding is carried on to obtain sorts and strains suitable under less favorable conditions. For all conditions a high-growing plant with a large percentage of leaves is sought. In addition, varieties are looked for which will succeed in the colder, northern localities, in comparatively high altitudes and in sections with limited rainfall. Plant-breeding with alfalfa at the Colorado experiment station showed a variation in weight of the individual plants from 14½ oz. to 5 lbs. 10 oz. in the green state, and of 23 to 53 per cent. in the proportion of leaves to stems. It was also observed that some plants produce over 300 per cent. more seed than others. All our alfalfa seed is produced west of the Missouri River. Investigations by the Department of Agriculture and the stations also indicate that the most drought-resistant varieties require 15 inches of rainfall in the Dakotas, 18 inches in Nebraska, and 20 inches in Texas, but that when cultivated in rows less moisture is required.

ALGERIA. A country of northern Africa, constituting administratively an integral part of the French Republic. The capital is Algiers.

AREA AND POPULATION. The total area, including the Algerian Sahara, is estimated at 393,837 square miles, divided into northern (77,208), and southern (316,629) Algeria. Other estimates place it at 343,500 square miles.

Total population (1906), including military forces, 5,231,850 (729,960 Europeans and 4,501,890 natives). In 1907 the number of marriages was 41,124 (European, 5,481; Mussulman, 35,643); divorces, 13,068 (223 and 12,845); births, including still-births, 143,074 (19,794 and 123,280); deaths, 109,974 (14,124 and 95,850). The agglomerated municipal population of Algiers in 1906 was 138,240 (total communal population, 154,049); Oran, 100,499 (106,517); Constantine, 46,806 (58,435); Bône, 36,004 (42,934).

EDUCATION. There were, in 1907, 1,358 primary and infant schools, public and private, with 159,581 pupils, besides 256 Mussulman schools; 21 institutions for secondary instruction, with 5,802 pupils (4,390 boys, 1,412 girls); 4 normal schools, with 259 students; and a university at the city of Algiers, with 1,509 students. At Algiers, Tlemcen, and Constantine there are higher Mussulman schools, with 219 pupils in 1907. The native population is Mussulman, the Jews being classed as French citizens.

PRODUCTION. There were 3,542,208 persons (Europeans, 208,869) engaged in agriculture in 1906. The area under the principal cereal crops in 1908 was as follows: Wheat, 3,387,858 acres; oats, 3,208,275 acres; barley, 334,768 acres.

In 1908 Algeria stood fourth (France, Italy, Spain) in the list of the world's wine producers, with an output for the year of 171,682,000 gallons. The acreage under vines in 1906 was 186,481 hectares. Of the 2,816,000 hectares under forests, 2,146,000 belong to the state, and 426,000 hectares bear cork-oak trees, which yielded, in 1907, 115,226 quintals of cork, valued at 3,923,598 francs. Large tracts of forest land are leased for pasture, etc., yielding a revenue of over 6,000,000 francs annually. Olive-oil production is an important industry, 12,802,170 trees in 1907 yielding 4,074,374 quintals of olives and 549,918 hectolitres of oil. Fruits are abundant. Flax and tobacco are cultivated. In 1907 the production of silk cocoons amounted to 2,535 kilos. The live-stock in 1907 numbered 221,453 horses, 174,182 mules, 265,022 asses; 211,270 camels; 1,081,734 cattle; 9,314,515 sheep, 4,253,435 goats, and 97,587 swine. Ninety-three per cent. of the live-stock belongs to the natives. The wool clip in 1907 was 210,814 quintals.

Out of 89 conceded mines, 51 were in operation in 1907. The iron ore extracted amounted to 973,000 metric tons, valued at 10,558,000 francs; lead ore, 15,300 tons, 2,187,000 francs; zinc ore, 71,000 tons, 7,893,000 francs; copper ore, 16,300 tons, 324,000 francs. Silver, mercury, antimony, and coal are also mined. The value of the output of all mines in 1907 was 21,634,043 francs. The phosphate output in 1907 was 373,763 metric tons, valued at 11,216,500 francs.

In 1907, 4,728 persons, with 1,328 boats of 6,863 tons, were engaged in the fisheries (sardine, anchovy, sprat, tunny-fish, and shell-fish); and the season's catch was valued at 3,831,341 francs.

COMMERCE. In 1908 the total (special) foreign trade was valued as follows: Imports, 460,556,000 francs, against 448,219,000 in 1907; exports, 325,812,000 francs, against 338,488,000 in 1907. The bulk of the trade is with France, the imports from that country in 1908 being

valued at 390,965,000 francs, and the exports thereto at 233,420,000. The chief articles of export (1908) were as follows: Wine, 80,751,000 francs; sheep, 34,386,000; wheat, 17,672,000; cork, 16,672,000; zinc ore, 11,595,000; barley, 11,168,000; olive oil, 10,942,000; phosphates, 10,601,000; fruit, fresh and dried, 9,998,000; oats, 9,953,000; iron ore, 9,685,000; wool, 9,572,000; hides and skins, 7,137,000; oxen, 6,896,000; tobacco, cigars, etc., 5,930,000; lead ore, 3,700,000.

COMMUNICATIONS. There were in operation in 1908, 2,013 miles of railway. The railway receipts (1907) amounted to 41,204,923 francs; the subvention received for the year was 11,600,013 francs. The total length of national roads was 1,859 miles. The total length of telegraph lines (1906) was 8,900 miles; of wire, 23,362; the number of offices, 628; receipts, 2,000,941 francs. The merchant marine, January 1, 1908, consisted of 895 vessels, of 28,079 tons. In the French and foreign trade, 1908, the total number of vessels entering and clearing at Algerian ports was 4,118, of 4,351,549 tons, and 4,326, of 4,635,044 tons respectively. Algiers is now the leading coaling station in the Mediterranean. A French transportation company has been formed to establish regular communication into the interior, by rail south from Algiers about 35 miles to Berroughia, thence by automobile to Laghouat, thence by brake to Ghardaïa, the leading town of the M'zab country.

FINANCE. Since 1901 the Algerian budget has been entirely distinct from that of France. Including military and extraordinary disbursements, the total expenditure exceeds the revenue by about 75,000,000 francs. Direct taxes only are paid by the natives. The proceeds of the military tax, the government monopolies, etc., are paid to France, but the departments of War and Marine are excluded from the estimates. For 1908 the estimate showed revenue, 108,592,201 francs; expenditure, 99,059,703. The budget estimate for 1909 was as follows: Revenue: Taxes, 50,517,850 francs; receipts *d'ordre*, 27,515,370; monopolies, etc., 8,491,250; state domain, 6,887,191; various, 2,320,467; exceptional, 600,000; extraordinary, 30,787,866; total, 127,120,094. Expenditure: Interior, 22,320,067 francs; public works, 21,542,137; administration and debt, 17,108,089; posts and telegraphs, 11,805,930; finance, 9,483,883; agriculture, etc., 8,790,355; native affairs, 4,983,891; various, 249,200; extraordinary, 30,787,966; total, 127,071,518. For the Southern Territories the revenue was estimated at 3,338,716 francs; the expenditure 3,332,652. In 1908 the total customs duties amounted to 13,702,817 francs. The debt amounted at the end of 1905 to 54,487,500 francs capital, and 114,072,219 francs in annuities, amortisation, and interest. The cost of the army is borne by the French government. The strength of the troops in Algeria, according to the budget estimate for 1909, was 56,113 of all ranks, and of the Tunis division, 19,554; or a total of 75,667 (Europeans, about 43,000; natives, about 32,000).

The Bank of Algeria, a bank of issue, has a capital of 20,000,000 francs; its note circulation is strictly limited to 150,000,000 francs. Its annual payments to the government, 1906-1912, are 250,000 francs. There are several co-operative agricultural banks assisted by government funds; and seven savings banks, with,

January 1, 1906, 18,561 depositors and deposits and interest to the sum of 4,542,524 francs.

GOVERNMENT. The government and administration of Algeria are centralized at Algiers under a governor-general, assisted by a consultative council. He has control of all administrative departments, excepting the non-Moslem departments of Justice, Public Instruction, Worship and the Treasury. The French Chambers exercise the legislative power. Each of the three departments (Algiers, Oran, Constantine) is represented in the National Assembly by a senator and two deputies. The Governor-General in 1909 was M. Jonnart, appointed in 1903.

ALKALOIDS. See CHEMISTRY.

ALL RED ROUTE. See CANADA.

ALTERNATORS. See DYNAMO-ELECTRIC MACHINERY.

AMADOR, MANUEL. The founder and first President of the Republic of Panama, died May 2, 1909. He was born in Cartagena, Colombia, in 1835. As a young man he engaged in business at Santiago de Veraguas, but in the '60's he went to Panama and became the leading physician on the Isthmus. In 1869 he was elected by the Conservatives President of the State of Panama, but before he could take office a revolution drove his party from power. He then resumed the practice of medicine and became chief physician of the Panama Railroad and the Pacific Mail Steamship Company. Much of the success of the revolution of 1903 is attributed to Dr. Amador. He refused to consent to delay in executing the *coup de main*, and the results proved his wisdom. The first constitutional convention held on February 16, 1904, unanimously elected Dr. Amador President. He served four years. He was very popular and a man of singular ability, as is shown by his success in bringing the Republic through its first years without serious difficulties.

AMBROSE CHANNEL. See HARBORS.

AMERICAN ASSOCIATIONS AND SOCIETIES. The associations and societies whose official titles begin with the word American will be found under the names of subjects in which such organizations are interested. For example, for the American Academy of Political and Social Science, see POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.

AMERICAN CANAL. See CANALS.

AMHERST COLLEGE. An institution of higher learning at Amherst, Mass., founded in 1821. The attendance in 1909 was 531, with 48 members of the faculty. There were in the library 90,000 volumes. Gifts and endowments were received during the year to the amount of \$240,000. The new biological and geological laboratories completed in 1908 were occupied in 1909. Among the changes in the faculty were the resignations of Prof. John Erskine, and Dr. H. D. Austin, and the appointments of Prof. H. F. Hamilton, Prof. W. A. Stowell, and Prof. C. H. Toll. The total productive funds of the college amount to about \$2,250,000. The president is George Harris, LL. D.

AMMONAL. See CHEMISTRY, INDUSTRIAL, paragraph Explosives.

ANÆSTHESIA. In a statistical review of the anæsthesia given in Germany during 1908,

Neuber found that in the work of 112 surgeons chloroform was employed 20,613 times, with one death to each 2060 anæsthesias; ether in 11,859 cases, with one death to every 5930 cases; chloroform plus ether in 10,232 cases, with one death in 3410 anæsthesias; and the scopolamin-morphine mixed anæsthesias, 23,809 times, with one death in 4762 cases. Local anæsthesia or a few whiffs of ether were used in at least 25 per cent. of the cases, which would have required general anæsthesia twenty years ago, and no death occurred among these patients. The figures closely agree, as to the relative mortality from chloroform and ether, with those of Gurlt, collected from 1890 to 1897, in which there occurred one death in 2075 chloroform, and one in 5112 ether anæsthesias. In respect to post-operative pneumonias, Neuber's statistics show that the scopolamin-morphine mixed method is a distinct advantage, no instances of this complication occurring. Kümmell reports only 0.61 per cent. of post-operative pneumonias in 1908, in contrast with 2.5 per cent. formerly; and von Eiselsberg only 0.9 per cent. against 3.3 per cent. formerly.

Among the newer experimental methods of including general anæsthesia was that of Ritter, who found that he could render dogs completely insensible to pain, without loss of consciousness, by injecting a solution of cocaine into a superficial vein. Ten cubic centimetres of a one per cent. solution or 5 c.c. of a 3 to 5 per cent. solution in a 0.1 per cent. solution of sodium chloride were used. The dogs lay quiet but alert, and breathed normally, but evinced no sign of pain even when the actual cautery was applied to the most sensitive parts of the anatomy. The anæsthesia lasted from 15 to 30 minutes, or even longer, and none of the animals experimented upon showed serious symptoms afterward. Some of the smaller dogs, in which the dose was proportionately large, were restless, and ran around in circles for some minutes before finally quieting down. The method has not been employed on human beings as yet.

In spite of many adverse reports general anæsthesia through the rectum was advocated strongly by at least three clinicians of note, who insist that with adequate preparation and proper technique this method is no more hazardous than the inhalation method. Legueu asserts that its advantages are so great in operations on the head, neck and thorax that it deserves the preference in such cases. He eliminates the injurious effects, such as irritation of the intestines by the fumes of ether, by blending the latter with oxygen, and precedes the application by a brief inhalation of ethyl bromide to relax the ileocecal valve. Carson advocates the rectal technique for operations on the thyroid gland, urging a lessened fatality, owing to the lungs being free to eliminate the ether as fast as it is absorbed; so that it can be safely used even when these organs are diseased. Dumont by the interposition along the course of the rectal tube of a hollow glass sphere, to condense the droplets of ether, allows only vapor to enter the intestines, thus preventing irritation and reaction on the part of the bowel. He also gives a preliminary dose of morphine.

SPINAL ANÆSTHESIA received a good deal of attention from continental investigators during 1909. To avoid direct contact with the spinal cord, Stoekel revived Cathelin's method of epidural injections. This consists in the injection

of an anæsthetic (cocaine usually) into the sacral canal below and outside of the dura of the cord. Stoeckel used this method in 141 obstetrical cases. In 111 the effect was unmistakable and favorable; in 12 it was dubious, and in 18 no effect was apparent. It is asserted that the anæsthetic did not seem to decrease labor pains when these were once well started, and no untoward results were observed in the child. Jonnesco's method of spinal anæsthesia attracted considerable attention. According to the technique of the Roumanian surgeon, a quantity of stovaine is placed in a sterilized rubber tube and to this is added a small dose of strychnine, dissolved in water. Spinal puncture is made, either between the first and second dorsal, or between the twelfth dorsal and first lumbar vertebræ, or both combined, and the proper dose injected. For anæsthesia of the head and neck the patient lies with the head slightly raised if the operation is to be done on the neck, or with the head horizontal if the operation is on the face or skull. For operations on the lower portions of the body or within the abdomen, injection is made into the dorso-lumbar region, and the patient lies with the shoulders raised. Jonnesco claims to have had no mishaps or fatalities, and that anæsthesia is always induced if the fluid has entered the subarachnoid space. Anæsthesia persists from $1\frac{1}{2}$ to 2 hours. The addition of strychnine to the stovaine and the higher point of puncture constitute whatever there is of originality in this method, which was not regarded with much favor on account of the danger of wounding the spinal cord.

Spinal puncture for the production of partial anæsthesia without unconsciousness was devised and demonstrated in 1885 by Dr. J. Leonard Corning, of New York. It has been used most extensively, successfully, and in patients of all ages, by Dr. W. S. Bainbridge of the same city.

LOCAL ANÆSTHESIA.—Hertzler, Brewster and Rogers, of the University of Kansas, have used quinine and urea hydrochloride as a local anæsthetic in operations usually performed under cocaine. This method, suggested first by Thibault in 1907, possesses many advantages over cocaine anesthesia, not the least important of which is absolute non-toxicity. In addition the drug gives a lengthened period of analgesia, a considerable diminution in the after pain of certain operative wounds, and a marked power to reduce hemorrhage. When injected into the tissues a sterile water solution of $\frac{1}{4}$ to 1 per cent. of the substance produced an anæsthesia lasting from 2 to 10 days. When a physiological salt solution replaced sterile water, the period of anæsthesia was somewhat lessened. As a topical application to mucous surfaces, solutions of 10 to 20 per cent. gave a fair degree of anæsthesia, but ideal results were attained only by injection into the submucous tissues. Among the operations performed under this form of anaesthesia were drainage of the gall bladder, drainage of appendiceal abscesses, exploratory laparotomies, hernia, castrations, varicocele and hydrocele operations, and the removal of all sorts of tumors ordinarily undertaken under cocaine.

ANGELL, GEORGE THORNDIKE. An American humanitarian, died on March 16, 1909. He was born at Southbridge, Mass., in 1823, graduated from Dartmouth College in 1846 and

studied at the Harvard Law School. He was admitted to the bar in 1851. In 1868 he became a founder and president of the Massachusetts Society for the Prevention of Cruelty to Animals. This position he held until his death. He established, also in 1868, the magazine *Our Dumb Animals*, and was its editor as long as he lived. Practically all of Mr. Angell's long life was devoted to the propagation of kindly and humane treatment of animals. He caused to be established over 70,000 "Bands of Mercy," whose members were pledged to this object. In addition he distributed millions of pages of humane literature. Mr. Angell also took an active interest in movements for the prevention of crime, prevention of adulteration of foods, etc.

ANGLICAN CHURCH. See ENGLAND, CHURCH OF.

ANGOLA. A Portuguese colony in western Africa. Estimated area, about 500,000 square miles; population between three and four millions. It is divided into six districts: Congo, Loanda, Benguella, Mossamedes, Huilla and Lunda. Capital St. Paul de Loanda. Cabinda, Ambriz, Novo Redondo, Benguella, Mossamedes, and Port Alexander are important towns. There are reported to be 52 government schools, and 7 municipal and 2 private schools; with altogether about 2400 pupils. There are several missions. The chief products are coffee, sugar, wax, vegetable oils, cocoanuts, ivory, oxen, and fish. The rubber supply is becoming exhausted. Cotton growing, once a remunerative industry, is now neglected. Tobacco is grown and manufactured for local consumption. Petroleum and asphalt are worked by a British syndicate. Large quantities of malachite and copper, iron, petroleum and oils are found. Gold is also present. The Katanga copper mines will be greatly benefited by the new Lobito-Katanga railway now under construction. The imports and exports for 1907 (exclusive of Congo) amounted to 6,029,898 and 4,479,776 milreis respectively (1 milreis = \$1.08). The chief imports are textiles; the chief exports coffee, rubber, and dried fish.

The length of railways reported open to traffic is 470 miles. About 121 miles of the line, to extend from Tobito Bay to the Central African railway system, are in operation; 274 miles of the Loanda-Ambacca extension to Malange; and 70 miles of the Mossamedes-Chella line. There were in 1907 1940 miles of telegraph line, and 63 offices. There were 122 post-offices. Angola has external communication by cable. In 1906 418 vessels of 810,769 tons entered, exclusive of coasting vessels. The revenue was estimated (1908-9) at 2,526,889 milreis; the expenditure at 3,494,330. The colony is administered by a governor-general (1908, Maj. H. de Paiva Conceiro).

ANIMAL DISEASES. See VETERINARY SCIENCE.

ANKYLOSTOMIASIS. See HOOKWORM.

ANNAM. A French protectorate in French Indo-China (q. v.). Area, 61,718 square miles. Population (1906), 5,513,681; Annamites in the towns and along the coasts, and various tribes of Mois among the hills. Hué, the capital, has 50,000 inhabitants; Bin-Dinh, 74,400. The educated classes follow the doctrines of

Confucius, but Buddhism is tolerated. There are 420,000 Roman Catholics. There are five secondary schools, with 23 teachers and 596 pupils. The country is naturally divided into a narrow littoral, habitable and cultivable on one side, and a wild, sparsely populated hill-tract stretching to the Mekong on the other. The Phanrang River has been utilized to irrigate about 10,000 acres, and similar works, on a smaller scale, have been carried out in the central regions. The productions are rice, corn, mulberry, cinnamon, tobacco, sugar, betel, manioc, bamboo, excellent timber, rubber, cardamoms, coffee, dye, and medicinal plants. About 300,000 kilos of raw silk are annually produced, one-third for export, the remainder for home manufactures. Coal mines are worked by natives at Nongson; iron, copper, zinc, and gold in the province of Quang-nam. There are salt works in several provinces. The imports and exports are included in those of French Indo-China (q. v.). At Tourane, in 1906, 28 vessels of 24,290 tons entered, and 21 of 17,032 tons cleared. The King, Duy-Tan, born 1899, succeeded to the throne September 9, 1907, on the abdication of Than-Thal, his father; he is under the control of a council of regency. Annamite functionaries, under French control, administer all internal affairs. French troops occupy part of the citadel (Mang-Ca) of Hué. The French Resident-Superior was (1909) J. H. Groleau.

ANTHOCYANIN. See BOTANY.

ANTHROPOLOGY While *Pithecanthropus erectus*, formerly viewed as a Tertiary precursor of man, has been relegated to Quaternary times as a result of recent geological investigation, the solution of man's phylogeny has been materially advanced by several new finds. With the original Neanderthal skull, subsequently allied with the skeletal remains from Spy and Krapina, anthropologists now class a skull from Le Moustier in the Dordogne, the skeleton discovered in August, 1908, by MM. J. Bouyssonie, A. Bouyssonie, and L. Bardon, and the remarkable lower jaw found by Dr. Schoetensack near Heidelberg. In August, 1908. Messrs. J. and A. Bouyssonie and L. Bardon discovered human remains while exploring a cavern near La Chapelle-aux-Saints. Geologically, these were found to belong to the Middle Pleistocene period, while their morphological character allied them with the well-known Neanderthal type now commonly referred to as *Homo primigenius*. Judging from the cranial sutures, the jaws, and the bones of the extremities, M. Boule inferred that the skeleton belonged to an aged male individual barely 1.60 metres in height. The tremendous lower jaw, the lack of a chin, the nearly circular orbital cavities and the very wide nasal apertures, all indicate a very primitive type of humanity. At least of equal importance is a mandible discovered in October, 1907, in a sand pit near Heidelberg and recently described by Dr. Schoetensack, one of the most interesting finds made within recent years. While the majority of the concomitant mammalian fossils belong to the oldest

Quaternary epoch, the presence of *Rhinoceros etruscus* and a variety of horse intermediate between *Equus Stenonis Cocchi* and the Taubach type definitely indicate Pliocene times. The jaw is accordingly the oldest of human remains hitherto found. Morphologically, the find presents extraordinary features. It lacks a chin—a specifically human characteristic—and the dimensions of both the body and the ramus are quite out of the ordinary. Were the teeth lacking, the jaw might have been attributed to an anthropoid ape, a part of the symphysis suggesting a gorillid type, while a fragment of the ramus points to a large variety of gibbon. The dentition, however, is unmistakably human. The canines show no trace of over-development as compared with the other teeth, and the size of the teeth generally is exceeded by those of some living Australian aborigines. The molars present indications of five (instead of four) cusps, a condition approximated to some extent by the modern Australians. The Krapina skull shows a later stage in the development of the teeth and the jaw. While the latter is so huge that beside it even the celebrated jaw of Spy seems of moderate proportions, the teeth, as already noted, show relatively slight development. Though there was ample space for the growth of a fourth molar, even the third is considerably inferior to the first two molars. Compared with the Neanderthaloid mandibles of La Naulette, Spy and Krapina, the jaw of *Homo Heidelbergensis* appears to belong to an older type, which has accordingly been characterized as pre-Neanderthaloid. A comparison with the jaws of the anthropoid apes leads Schoetensack to the conclusion that *Homo Heidelbergensis* must be conceived as a generalized pre-anthropoid type as well. That is to say, it represents a form from which both modern men and the anthropoids have differentiated by specialization in different directions. This interpretation thus rehabilitates the theory of Klaatsch that man, in spite of his close morphological kinship with the anthropoids, is not directly descended from them, but rather forms a relatively new simian type ancestral to both *Anthropoidea* and *Hominidae*.

NORTH AMERICA. In connection with the Hudson-Fulton celebration, the American Museum brought together a series of papers clearing up the archeology and ethnology of the North American aborigines formerly residing in the vicinity of Manhattan Island. It appears from Mr. Skinner's summary of these investigations that the prehistoric condition of these natives was essentially of Algonkian type, somewhat influenced by Iroquois contact, and in complexity superior to the culture of the simpler New Englanders, yet inferior to Iroquois culture. An important contribution to the hitherto little-known Southeastern culture area of North America has been made in Dr. Speck's monograph on the Yuchi. The Yuchi formerly occupied parts of eastern Georgia and South Carolina. While linguistically distinct from any other stock, they belonged politically to the Creek confederacy, which they joined about 1729 in order to save themselves from hostile encroachments of the Muskogian tribes. The social organization of the Yuchi is marked by the co-existence of exogamous totem clans of which the membership is inherited through

the mother with patrilineal chief and warrior moieties embracing the entire male population. The members of a clan refrain from injuring their totem animal, which, in turn, becomes each clansman's protector at the time of his puberty initiation. Four of the clans enjoy special prerogatives, inasmuch as membership in them is prerequisite to eligibility to the highest tribal offices. In the ball game, the players are divided into sides by moieties; there is also a difference in mortuary painting and a differentiation of ceremonial functions. The most important political unit, however, is the Yuchi town, in which citizenship was determined by birth. The centre of the town is a square plot of ground, with sides facing the cardinal directions and a central fireplace; on ceremonial occasions, officers and members of the moieties seat themselves in a definite way along the sides. The square symbolizes the rainbow and is decorated with paint, colors and vegetation in accordance with this conception. On this plot the great annual festival was celebrated at the time of the ripening of the corn. The ceremony lasted several days, part of which time the adult participants were obliged to fast. New fire was publicly kindled in the square by the town chief, and each participant took an emetic as a preventive of sickness. These rites are especially significant as suggesting a connection with the ceremonies of the Southeastern culture area of North America.

The Assiniboine, representatives of Northern Plains culture, have been described by Dr. Lowie. Linguistically most intimately related to the Yankton Dakota, they have been closely associated with the Cree for two centuries, and thus present an instance of the confluence of two cultural streams. Cree influence is especially obvious in Assiniboine mythology, into which numerous episodes common to several Algonkian tribes have been incorporated. The social organization seems to have been rather on the basis of bands than on that of exogamous clans. A body of soldiers acted as the police force of the camp, but was not connected, as in several other Plains tribes, with a system of age-societies. There were, however, a number of military organizations closely resembling in single features the ceremonial age-classes of the Arapaho. Discussing these, Lowie arrives at the conclusion that two entirely different types of age-societies must be distinguished within the Plains area: the feasting age-classes of young men, middle-aged men, and old men of the Omaha; and the ceremonial age-groups of the Western Algonkian and Upper Missouri Indians. The societies of the latter do not seem to correspond to natural divisions by age, so that some other factor of as yet problematic character must be supposed to enter. As for the ceremonial traits of the age-societies, they do not exhibit a clear differentiation from ceremonial organizations ostensibly based on community of supernatural revelations. The police functions exercised by age-societies seem to be only secondarily associated with them, as precisely the same disciplinary powers are wielded by other social units in other tribes, and corresponding conclusions are reached with respect to such traits as the foolhardiness and clownish behavior obligatory on members of certain organizations. The study of age-societies must accordingly resolve itself into tracing

the diffusion of well-marked single elements and discovering their various combinations in the several tribal groups.

Of the Plateau people, the Shoshone have also been studied by Dr. Lowie. On the basis of traditional lore, mythology and historical data, he arrives at the conclusion that the Shoshone were not, as Brinton assumed, ancient inhabitants of the Plains. The development of fishing and the chase for small game, the old type of grass-lodge, the weaving of sage-brush bark, the simplicity of their social and ceremonial organization, the absence of tales about the buffalo and the mythological importance of the coyote and wolf, all tend to establish a closer affinity with the culture of the Plateau and Californian regions. The Shuswap, another Plateau tribe, have been described by Teit. Their culture is essentially similar to that of the Thompson River Indians, but in the western and northern portions of the tribe a typical contact phenomenon has been observed in that these sections have adopted the organization of the Carriers and Chilcotin with its tripartite division of society into nobles, common people, and slaves.

In the southwest, Dr. Fewkes has completed his investigations of "Spruce-Tree House," one of the Mesa Verde antiquities of Colorado. The village stands in a recess protected above by an overhanging cliff. It contains over a hundred rooms, partly secular, partly ceremonial, the former being rectangular, the latter circular and subterranean; in places the House was three stories high. The walls were built of stones generally laid in mortar, but sometimes piled on one another. Architecturally, the cliff-dwellings excel Pueblos of more recent construction. The ceramic art is on a level with that of other southwestern peoples, but is less symbolic. While the inhabitants of Spruce-Tree House have a general cultural resemblance to the Pueblo, the absence of marine shells, turquoise ornaments and obsidian flakes indicates that they were not on intimate trading terms with their neighbors.

Intensive linguistic work has been carried on in North America by Drs. Swanton, Sapir and Goddard, who have published collections of myths in the original Tlingit, Wishram and Kato languages respectively. The *Handbook of American Languages* has not yet been issued from the government press, but has reached the page-proof stage.

SOUTH AMERICA. In South America, Eric Boman has carefully reexamined the much-discussed Calchaqui question. He finds that the Calchaqui constituted but a single tribe of the Diagita stock, the territory of which extended between Araucania and the Argentine Republic. The Calchaqui proper occupied only the western frontier of what is now the Province of Salta. Prehistoric remains are very numerous in the Diagita area. There are many remnants of walls, monoliths, and large stone-heaps. The pottery, while of inferior craftsmanship, reveals the Peruvian style of decoration; funeral urns are very prominent; some of them serve as coffins, enclosing, as a rule, the bodies of infants. The use of coffin-urns was not found in ancient Peru, but is characteristic of the Tupi-Guarani of eastern South America and was probably derived from them. Clay tobacco pipes probably go back to the same

source. Apart from these influences, Boman finds the "Calchaqui" culture essentially related to that of Peru. While lacking in monumental edifices, the archaeology of the Diagita reveals the Peruvian type of everyday dwellings. The ceramic productions are identical in technique, form, and decoration with those of Peru; the conventionalized representation of puma and the occurrence of a distinctively Peruvian type of vase—the cone-bottomed aryballus—are especially noteworthy. While the most characteristic stone axes of the Diagita region occur but rarely in Peru, all the Peruvian forms are likewise found on Diagita sites. The copper objects, as well as the metallurgical processes, of the two territories are also in close agreement. To these indications of intimate contact with Peru, Boman adds the occurrence of Quechua place names, and, the basis of historical sources, the knowledge of the Quechua language by the Diagitas in pre-Hispanic times.

Finally, the residual folk-customs and folklore of the half-caste Diagitas of to-day are clearly related to Peruvian observances and beliefs. While Boman thus connects the "Calchaqui" and Peruvian cultures, he strongly opposes Ambrosetti's theory that the Calchaqui are related to the Pueblos of North America on the ground that the analogies adduced in behalf of this assumption are inconclusive and that there are no traces of the supposed relationship anywhere in the immense region intervening between the two tribes. The hitherto little-known Jibaros of Ecuador have at last been reported on by Dr. Rivet. Among their cultural possessions he notes a throwing-board for poisoned arrows and a signal-drum audible for the distance of 15 kilometres; the shrinking of the mummified head trophies characteristic of the Jibaros is described as due to the application of hot stones. The natives of north-westernmost Brazil are being systematically dealt with by Dr. Koch; their secret societies, masquerade dances, and initiation ceremonies with flagellation rites are of special interest.

ASIA. Of the so-called pale-Asiatic tribes, the Chukchee have been described by Bogoras with regard to their social organization. The family forms the unit of organization, and there is a preponderance of paternal relationship. Families are grouped together into larger divisions called *varat*, which unite all individuals pledged to avenge one another's death. Among the Reindeer Chukchee the political unit is the camp, while among the Maritime Chukchee it is the village. The camp is usually very small, including but few houses, one for each family. There is a master of the camp, who occupies the front house. He orders the change of the camping-place and pasture-ground, and superintends the bringing in and slaughter of the reindeer, as well as ceremonial observances. In camps of rich men, the masters have assistants, who are sometimes treated with great kindness, may marry a relative of the master's, and even become the power behind the throne. In cases of necessity, neighboring camps usually lend one another a helping hand. The Maritime village is not based on relationship, but on territorial contiguity. There is usually a front house, occupied by the family that has lived the longest in the locality. Where no such house exists, all the inhabitants are on a footing of equality. The social unit of the Mari-

time people engaged in sea-hunting is the "boatful," consisting of the eight or nine men of the crew. The owner of the boat is considered master and occupies the helm. The most characteristic legal institution of the Chukchee is the vendetta. Each family is justified in killing an obnoxious member of their own number, but a murder outside the group is avenged by the relatives and friends of the slain individual. Minor crimes are usually punished by a compensatory payment, which is also, though more rarely, offered in case of murder.

In western Asia, Turkestan has been Dr. Stein's field of exploration. The inhabitants of Khotan in eastern Turkestan are found to be a non-Mongolian tribe, being somatologically related to the Indo-Iranian Galchas. Khotan was settled simultaneously by northwest Indians and by Chinese colonists. Most important among the recent finds are wooden tablets with Kharosthi inscriptions dating back to the third century. A. D. The use of wood points to ancient Chinese influence, which is further attested by the discovery of Chinese documents and coins. On the other hand, the seals of these wooden epistles bear clear evidence of classical influence, such as figures of Pallas Athene and Eros. Wooden tablets of Chinese origin are thus found inscribed in an Indian language and in conjunction with Græco-Roman seals.

The Orang Kubu of Sumatra have been investigated by Dr. Hagen. Physically, they comprise two types—a tall group with long and narrow heads, and a short group with relatively short and wide heads. The shorter people Dr. Hagen regards as more primitive and as related to the Senoi of the Malay Peninsula and Veddahs of Ceylon. Culturally, the lack of bows, arrows and blowguns is a noteworthy feature; a wooden spear constitutes the principal weapon. Dr. Hagen contends that the Kubu represent the lowest of existing tribes, but Father Schmidt in a spirited review denies their primitiveness and accounts for the simplicity of their culture by the theory of degeneration from an even originally low level.

Studies in northwestern Luzon have shown Mr. Fay Cole the distribution of aboriginal tribes in this region. He recognizes four distinct tribes: Negritos, Igorots, Tinguian-Apayaos, and Kalingas. Of these, the Negritos have in every case adopted the language and, except in one subdivision, the culture of their neighbors, but stand as representatives of a distinct race. Of the remaining three divisions, the Igorots form a separate subclass. They also show the influence of recent contact and degeneration of older customs. A pristine exogamic institution has disappeared, and while a men's house for unmarried men and boys persists, the women's house of the Bontos exists only in memory. North of the Igorots is the great Tinguian belt. The Tinguian have extensive fields of rice, corn and tobacco, but are also ardent hunters. The gable roofs of their houses differ widely from the angular bell-shaped roofs of the Igorot dwellings. Exogamic divisions and men's houses are lacking, and women enjoy a higher social position. The Apayaos live in elevated one-room bamboo structures floored with rattan. In each village, one or more larger dwellings with roofs shaped like an inverted boat serve for the celebration of dances.

and feasts. Agriculture is less highly developed than among the Tinguians, though considerable rice is cultivated. Head-hunting flourishes to a remarkable extent. The Kalingas have dwellings with two rooms, the floor being raised about three feet, though the sideboards extend to the ground. As no iron-work is done in this section, most of the spears are fitted with bamboo points. A long tapering shield with three prongs above and two below is typical of the country. Head-hunting seems to have a more religious motive than among neighboring tribes. Linguistically, the Kalingas, Tinguians and Apayaos are all rather closely related.

AFRICA. In East Africa the Nandi have been investigated by Hollis. The Nandi are a people related to the Masai and have probably developed from a mixture of Nilotic negroes with the Hamitic Galla and Somali. Their social customs are marked by elaborate puberty rites for both sexes and a pure form of totemism with exogamy and taboos against killing and eating the totems.

Some light is being thrown on the exotic origin of some features of West African culture. Balfour has discussed the distribution of the crossbow, which, as a serious weapon, is restricted to the Fan and Mpongwe tribes, and their immediate neighbors. The accepted theory is that the West African crossbow is a degenerate descendant of the elaborate appliance once used in Europe. Balfour draws attention to the fact that in a Norwegian village the whalers still employ a crossbow differing completely from all other European crossbows, but precisely similar to that of the Fan and Mpongwe in its release-mechanism and presumably going back to the same prototype. Crahmer, amplifying investigations begun in 1908, has argued that the art of Benin, irrespective of quite subordinate indigenous elements, represents essentially a hybrid Indo-Portuguese style, some of the figures being directly modeled on East Indian patterns. The introduction of the art was due to Portuguese colonial trade, and Portuguese, East Indian, or even German, casters were probably the metallurgical instructors of the aborigines.

In a preliminary report, Professor Starr has added to our knowledge of Congo ethnography. His measurements of the Batwa tributary to the Bakuba show that these supposed Pygmies are of rather greater stature than the dwarfish tribes of the Ituri forest; nevertheless, Starr inclines to the view that they belong to the same category on account of their exclusive dependence on the chase, their use of the bow and poisoned arrows, adherence to the palm-drill and fire-plow for fire-making, and their political subjection. Corresponding investigations of the more eastern Batwa lead Czakanowski to the conclusion that this generic term has been applied to anthropologically quite distinct peoples. The Batwa of the Ruwenzori are genuine Pygmies, light in color and about 4 ft. 9 in. in height, while the Batwa of the Lake Kivu district are simply small dark-colored negroes, averaging about 5 ft. 3 in. Linguistically, the Pygmies between the Ruwenzori and Uele are not at present differentiated from the Balese. Sociological researches into the other tribes of the region lead to the determination of a generally diffused totem clan

system with paternal descent, religious veneration for the totems, and strongly marked blood-feud customs. Contrary to accepted conceptions, Czakanowski did not find the pastoral Hamites predominating over a majority of agricultural Bantu in Uganda and Unyoro, but only in Ruanda.

OCEANIA. Australia remains the continent most eagerly studied in the interests of sociological speculation. Graebner, Foy, and—still more recently—Father Schmidt have outlined schemes of the probable evolution of social forms and customs. As representatives of the oldest "Nigritian" stage, Schmidt postulates the conditions of Tasmania and southeastern Australia, viz., sex-totemism with paternal descent and local exogamy without hereditary clan totems. This is supposed to have been followed by the "West Papuan" culture characterized by paternal descent and local totemism and exemplified by the Narrinyeri. Third follows the "East Papuan" culture of the two-class system with maternal descent; Schmidt distinguishes a southern and a northern subculture group, by whose contact there originated the four-class system. In central, southern, and a part of western Australia, Schmidt assumes a retroactive influence of the Western Papuan culture, effacing or modifying the two-class and four-class systems of the third stage, and establishing the worship of male ancestors and the introcision rite as a tribal initiation performance consequent on circumcision.

Father Schmidt has been equally concerned with the linguistic investigation of the South Sea area and has succeeded in finding more and more languages belonging to a non-Polynesian, "Papuan" stock. His most recent discovery in this line is that the inland inhabitants of Bougainville, one of the Solomon Islands, speak a Papuan tongue. On the basis of all his researches he postulates a pre-Austronesian, Papuan era in the South Sea. While the linguistic problems of Oceania have thus been attacked by Father Schmidt, Dr. W. H. R. Rivers has resumed discussion of certain sociocultural-religious questions arising from a study of this region. Rivers defines true totemism by three criteria: The connection of a class of animals, or objects, with a social division, which is generally exogamous; the belief in kinship between the members of the social group and the totem, which is usually regarded as the ancestor of the group; and the religious veneration shown to the totem, generally by tabooing its flesh as an article of food. Previous investigators had suspected the presence of totemism in Polynesia and Melanesia, but were opposed by Tylor, who denied its existence within this area. Rivers strengthens the former position by some original observations. He argues that in Fiji and Samoa there are remnants of genuine totemism, though the typical form of totemism with exogamy has disappeared. At the same time he does not believe that the deities now venerated by the Fijians and Samoans are the direct descendants of former totems, but that they are deified heroes incidentally connected with definite totem animals. On the Reef Islands Dr. Rivers found typical totemism inasmuch as the food taboos are there connected with exogamous groups, though these groups have names differing from those of the tabooed animals. The same institution occurs on Santa Cruz and

Vanikolo, where, in addition to the Reef Island features, the exogamous groups share the names of their totems. In the Solomon Islands, the special field of Rivers's researches, conditions are very complex and led Codrington, the foremost of previous investigators, to deny the existence of totemism, but Dr. Rivers insists on the presence of his three cardinal indications of genuine totemism. A point of the greatest interest within this area is the frequent association of several totems with the same social group. This may be accounted for by the fusion of two peoples with distinct totems or the transition from matrilineal to patrilineal descent with inheritance of the father's as well as the mother's totem.

A question of the greatest theoretical significance—the connection of American culture with that of the Pacific Islands and Southeastern Asia—has been recently re-opened by Dr. Graebner. The presence of skin capes, beehive-shaped huts and coiled basketry among the Fuegians, leads this ethnologist to assume a connection between the culture of this people and that of the ancient Australians. But it is primarily the northern and northwestern region of South America—the territory from Guiana to the Gran Chaco, including the domain of the most highly cultured aborigines, as well as the area of the Caribs and Arawaks—that seem to reveal an affinity with Melanesian and Asiatic culture. The Peruvian process of knot-dyeing is identical with "Ikatten" technique of India and Indonesia; the crutch-like grips of paddles, as well as the several types of paddle-blades, are homologous with Melanesian and Indonesian forms; the South American signal drums are similar to those of Africa and Indonesia; and the basketry shapes and techniques likewise resemble corresponding specimens from the same areas. These traits—joined, as they are, with numerous other suggestive parallels—cannot, Graebner contends, be explained either by convergent evolution or by the psychical unity of mankind: they must be accounted for by the theory of a cultural contact. In North America, the indications of such contact, though slighter, are nevertheless extant. Though to some extent obscured by effects of relatively recent intercourse with Northern Asia, two cultural areas, the territory of the Pueblos and the Northern Coast, exhibit a fair number of features characterizing the Melanesian "bow and two-class" cultures; and Dr. Graebner traces several of these traits through their hypothetical path of migration on the Asiatic side of the Pacific. Whatever may be the final estimate of Dr. Graebner's theory, his views are sure to excite lively discussion in the immediate future on the part of Americanists.

SOCIETIES, INSTITUTIONS, FIELD WORK. At the Winnipeg meeting of Section H of the British Association for the Advancement of Science, held from August 25 to September 1, under the sectional presidency of Professor John L. Myers, the progress of anthropological science was extensively discussed, special emphasis being given to Old World archaeology and Canadian problems. The United States were represented by Professor Franz Boas, Dr. G. B. Gordon and Dr. George G. MacCurdy. The American Anthropological Association held its annual meeting at Boston during Christmas week and re-elected Professors William H. Holmes and

George G. MacCurdy, President and Secretary respectively. Mr. F. W. Hodge remains editor of the *American Anthropologist*, but, owing to his new responsibilities in connection with the Bureau of American Ethnology, Dr. John R. Swanton has been delegated to assist him in his editorial work. The American Folk-Lore Society also met during Christmas week in conjunction with the American Anthropological Association. Professor Belden was elected President, while Dr. Peabody was chosen to replace Dr. Tozzer as Permanent Secretary. The society is endeavoring to extend the scope of its investigations so as to embrace the entire field of folk-lore, foreign as well as American. In accordance with this tendency, Professor Kittredge of the English Department of Harvard University has been chosen to assist Professor Franz Boas, the editor of the *Journal of American Folk-Lore*. The New York Ethnological Society, though continuing its monthly meetings during the academic year, has virtually become a publishing organization. In the course of the year it has added to its new series Volume 2, containing Sapir's *Wishram Texts*. The Anthropological Society of Washington (President, Dr. Walter Fewkes; Secretary, Dr. John R. Swanton) continues to flourish. Members report on their folk-lore in archaeology, linguistics and ethnology, and visitors are invited to give popular lectures illustrated with lantern slides. The organization of a new Alabama Anthropological Society must be of interest to all students of the series.

Important changes have occurred in the supervision of the two Federal institutions devoted to anthropological investigation. Professor William H. Holmes has resigned the chieftancy of the Bureau to assume the curatorship of the National Museum made vacant by the decease of Otis T. Mason. Professor Holmes's administrative duties devolve on Mr. Frederick W. Hodge, who receives the title of "Ethnologist in Charge."

During 1909 the Bureau issued *Bulletins* 38, 39, 41 and 42 embodying respectively: Emerson's *Unwritten Literature of Hawaii*; Swanton's *Tlingit Myths and Texts*; Fewkes's report on *Antiquities of the Mesa Verde National Park* and Hrdlicka's *Tuberculosis Among Certain Indian Tribes of the United States*. The American Museum of Natural History is maintaining two expeditions to the Southwestern culture area of North America, Dr. Goddard devoting himself to the Athabascan and Dr. Spinden to the Pueblo tribes of that region. Under the auspices of the same institution, Mr. Harlan I. Smith visited the coast of British Columbia, Mr. Skinner resumed work among the eastern Cree and northern Ojibwa, while Mr. Wilson continued his researches into Hidatsa life. Dr. George A. Dorsey has set out for a second trip around the world in the interests of the Field Columbian Museum of Chicago. This institution, as well as American anthropology generally, sustained a severe loss in the murder of Dr. William Jones in the Philippines. Dr. Jones's work has been taken up by Messrs. Simms and Cole. The University of Pennsylvania sent out Dr. Sapir to study the language of the Ute, while investigations on Shoshonean dialects supplementary to his previous work were pursued by Professor Kroeber of the University of California. Dr.

Tozzer of Harvard has left to carry on archaeological investigations in Guatemala, and Professor Frederick Starr, of Chicago, is engaged in an ethnographical trip to Japan. The Peabody Museum Expedition to the headwaters of the Amazon, in the interior of Peru and Bolivia, has returned under the leadership of Dr. Farabee. Of foreign anthropologists, Dr. Pöch remains among the Bushmen of the Kalahari, Dr. Lehmann has been studying the archaeology and linguistics of Central America, and Doctors Thurnwald and Rivers have returned from the Solomon Islands. Dr. Jochelson has left the Aleuts and is turning his attention to Kamchatka. Professor Henry Montgomery of Toronto University continued his exploration of the prairie mounds and earth works in Manitoba and Saskatchewan.

ANTIGUA. A West Indian island, consisting, with Barbuda and Redonda, a Presidency of the Leeward Island Colony. Total area, about 170 square miles. Population (1901), 34,971. Sugar is the principal crop, and cotton is raised to a considerable extent. Both are exported, and also molasses, pineapples, tamarinds, and arrowroot. Imports and exports in the fiscal year 1908 were valued at £168,398 and £174,972 respectively; in 1908-9, £175,587 and £179,106 respectively. Revenue and expenditure for 1907-8 amounted to £50,620 and £46,968 respectively; for 1908-9, £51,502 and £49,964 respectively. The public debt, June 30, 1909, stood at £130,300. The capital is St. John (pop. about 10,000), which is also the seat of government of the Leeward Island Colony.

ANTIMONY. In 1908 only one lot of ore, the value of which was wholly or principally confined to the antimony content, was reported to the United States Geological Survey, as having been mined and marketed in the United States. This lot was mined from the Bloody Cañon mines near Mill City, Humboldt county, Nevada. The imports of antimony during 1908 were very large, though they were exceeded by both 1906 and 1907. The imports of metal and regulus amounted in 1908 to 8,089,915 pounds; crude antimony and ore amounted to 3,287,218 pounds, and the salts of antimony amounted to 623,125 pounds. The total value of all varieties of the production amounted to \$944,034. The prices in 1908 were low, compared with those of 1906-7, but they were nearer normal than in the latter years. In 1909 the market in antimony was very quiet. The only occurrence of any importance was the imposition by the government of an additional duty of $\frac{1}{2}$ of a cent per pound, making a total duty of 1 $\frac{1}{2}$ cents a pound. This was done with the intention of stimulating the production of American ores.

ANTIQUARIAN SOCIETY, AMERICAN. A learned society organized in 1812, in Worcester, Mass. Its membership is elective and is limited to 175. Nearly all the famous historical scholars and writers have been members of the Society, which is strictly national in its scope. A library is maintained at Worcester, Mass., which is the headquarters of the Society, and in this there are about 100,000 volumes. It is one of the great libraries of the country for students of American history and allied subjects. It includes a very valuable collection of newspapers and manuscripts. The Society at

one time maintained a valuable museum, but the establishing of the Smithsonian Institution at Washington and other museums of like character made this superfluous, and the collections of the Society were transferred to the Peabody Museum and the Worcester Society of Antiquity. A considerable number of interesting historical works are, however, exhibited in the Society's building. The publications of the Society comprise two series, the *Transactions* and the *Proceedings*. The *Transactions* were established in 1820, and in them have been published some of the most important matters relating to the early history of the country. The *Proceedings* have been published regularly since 1849. In them are many papers and monographs of much importance. The issue for April, 1909, completed Volume XIX. of the series. A fund was completed in 1908 for the beginning of the erection of a new building for the Society. The cornerstone of the new library was laid in October, 1909, with a historical address by Charles Francis Adams, and a description of the building by President Lincoln. It will be ready for occupancy in October, 1910. The officers in 1909 were: President, Waldo Lincoln; Vice-Presidents, Samuel Abbott Green, Andrew McFarland Davis; Secretary for Foreign Correspondence, Franklin Bowditch Dexter; Secretary for Domestic Correspondence, Charles Francis Adams; Recording Secretary, George Parker Winship; Treasurer, Augustus George Bullock; and Librarian, Clarence Saunders Brigham.

ANTI-SALOON LEAGUE. An organization founded for the spreading of Prohibition sentiment throughout the United States. It began with the organization of the Anti-Saloon League in the District of Columbia in 1893. From this developed the national organization which was founded in Washington in 1895, mainly through the efforts of Bishop Wilson of the Methodist Episcopal Church. The purpose of the League is the federation of churches of every name with temperance societies and other organizations opposed to the liquor traffic and the concentration of these forces against the common enemy. It has no affiliation with political parties and works independently. The work of the League in 1909 will be found noted in the article PROHIBITION. The officers in that year were as follows: Officers (1907-1909).—President, Bishop L. B. Wilson (Methodist Episcopal); Vice-Presidents, Bishop G. M. Matthews (United Brethren), Father James M. Cleary (Roman Catholic), Rev. David J. Bell, D.D. (Reformed), Bishop J. W. Hamilton (Methodist Episcopal), Rev. Frederick D. Power, LL.D. (Disciples), Rev. W. B. Crumpton, D.D. (Baptist), Judge Charles A. Pollock (Methodist Episcopal), Rev. Washington Gladden, D.D. (Congregational), Rev. William L. McEwan, D.D. (Presbyterian), Rev. J. C. Barr, D.D. (Southern Presbyterian), Bishop H. C. Morrison (Methodist Episcopal Church, South), Bishop William N. McVickar (Protestant Episcopal); General Superintendent, Rev. Purley A. Baker, D.D. (Methodist Episcopal); Recording Secretary and Secretary of Headquarters Committee, Rev. S. E. Nicholson (Friends); Corresponding Secretary, Mr. James L. Ewin (Methodist Episcopal); Treasurer, Mr. Foster Copeland (Presbyterian); Acting Legislative Superintendent, William H. Anderson (Methodist Episcopal); Assistant General Superintendent,

ent, Rev. G. W. Young, D.D. (Methodist Episcopal Church, South); Attorney, Wayne B. Weber (Congregational); Chairman Headquarters Committee, Rev. Howard H. Russell, D.D. ANTITOXIN. The value of antitoxin in diphtheria is so firmly established that little new work is being done with this particular serum, investigators devoting themselves to the wider field of sero-therapy and vaccine-therapy, and the intricate problems of immunity. Advances in this region of science will be noted under the title of **SERUM-THERAPY** (q. v.). One phase of antitoxin in administration, however, has received the anxious attention of many workers in this field, and this is the phenomenon known variously as anaphylaxis, hypersusceptibility or serum disease—a condition of sensitization produced in certain individuals after the administration of a dose of antitoxin, so that a second injection given within a variable period of time brings on a profound toxemia, sometimes ending in death. According to the *Journal of the American Medical Association*, the exact nature of the reaction is, up to the present time, entirely unexplained. The phenomenon is not attendant solely upon the exhibition of diphtheria antitoxin, but may be produced by the injection of almost any soluble protein. The animal so injected becomes, after a period of ten days or two weeks, susceptible to a second injection of the same protein, so that this protein is now extremely toxic, and may cause death in a few minutes. Not all animals react alike in this respect; the guinea-pig is most readily sensitized and intoxicated, and sensitization seems to last throughout the life of the animal, and to be transmitted to the offspring. While some of the human cases of acute intoxication from antitoxin have occurred in patients who have apparently been sensitized by a previous injection of serum, yet in others the poisoning occurred with the first injection. It has been frequently noted, with regard to these cases, that the patient was afflicted previously with asthma, especially with "horse asthma"—in which the attack followed contact with horses; in other cases the individuals have shown an idiosyncrasy to eggs, or to some other protein food. It is therefore suggested that certain persons may become sensitized to foreign proteins by other means than injection, and possibly they are congenitally susceptible. Against these observations must be set the fact that serum has been injected twice into thousands of human beings at intervals of eight days and over (the period during which hypersusceptibility is supposed to be developed) either without any evidence of sensitization, or at most with only local reactions. In view of the enormous number of cases in which patients have received a second dose of antitoxin, without harm, it would seem that this serum should not be withheld, in cases where it is urgently needed, although indiscriminate prophylactic injections should be avoided. Besredka of Paris declares that the anaphylactic sequellæ can be modified, but not entirely prevented, by heating the serum to 56° C. for an hour on four successive days; that ether or chloroform narcosis confers complete but transitory immunity; and that the prophylactic injection of serum which

has been heated to 80° C. confers a sure and lasting immunity which is established by slow degrees after a slight reaction. He also asserts that the best way to prevent anaphylactic complications consists in the prophylactic rectal injection of serum, or the injection of a minute dose of the same serum under the skin, to induce the formation of an anti-anaphylactic substance.

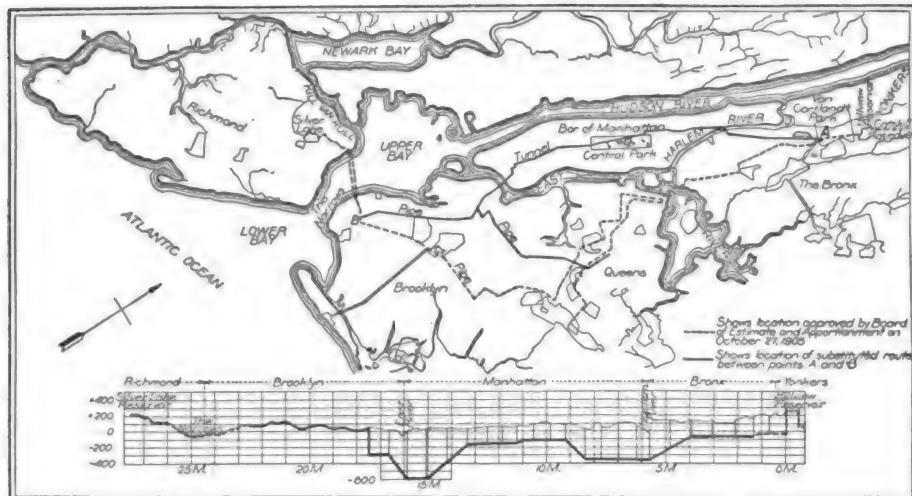

ANTI-VIVISECTION. See VIVISECTION.

AQUEDUCTS. During 1909 a further advance was made with the 240 mile aqueduct which the city of Los Angeles, Cal., put under way in 1907, to bring water from the Ownes Run in the Sierra Nevada Mountains. Not only will water be furnished for the industrial and domestic uses of the city, but for irrigating land in the immediate vicinity, while at the same time the fall is sufficient to generate considerable electrical power. The estimated expense of carrying out this huge undertaking was \$24,500,000, and the work was being carried on by the city itself, bonds being sold from time to time to meet the expense. The work, which was about one-third completed in 1909, was expected to be finished by 1913 and was designed to convey 280,000,000 gallons per day of 24 hours, or enough for a city of 1,000,000 people, and for the irrigation of 75,000 acres of now unproductive land contiguous to the city, besides supplying power to a large hydro-electric plant. The work was being undertaken under exceptionally difficult circumstances, as much of the route lay either in desert or rugged and inaccessible country so that a railway 120 miles in length had to be constructed for supplies, local reservoirs built for water and power, and finally a large municipal cement works established at Tehachapi at a cost of \$400,000 to supply the 1,180,000 barrels of cement needed in the work. In addition to the railway, freighting is done with caterpillar engines. A complete telephone system over the 250 miles of line connects the chief engineer's office at Los Angeles with every division. As fuel is extremely expensive along the line, use has been made of electric power wherever possible and three hydro-electric stations were constructed which distribute some 3000 horse-power along 160 miles of the line, hydraulic dredges, power shovels and tunnel equipment being electrically driven. The aqueduct is composed of 22 miles of canal, 152 miles of cement-lined conduit, 29 miles of tunnel through rock and earth, 14 miles of steel siphons 8 to 10 feet in diameter and 2 miles of flume, or a total of 218 miles which, with 22 miles of reservoir, makes up the total length. The excavation was estimated at 8,500,000 cubic yards of loose earth and rock and the consumption of 23,450,000 pounds of steel in addition to the 1,180,000 barrels of cement mentioned. In 1909 work was in progress in six faces of the 26,860-foot Elizabeth tunnel through the crest of the Coast Range Mountains. On December 31, 1909, the total tunnel excavation was reported by the engineering departments of the Los Angeles Aqueduct as 157,121; of conduit excavation, 180,254; of tunnel lining, 52,456, and of conduit lining, 122,396.

In the excavation of the canal no work was attempted until the entire working plant and housing facilities had been assembled and thoroughly organized, the preliminary work taking until October, 1908. In that month one-half mile was excavated and this was gradually in-

creased until in April, 1909, a working rate of about five miles a month was attained and was to be maintained until the completion of the work. The major part of the line consists of cement-lined conduit, the trench being excavated to the approximate size and shape for the 12 foot wide by 10 foot deep conduit, and then lined with monolithic concrete, after which a reinforced concrete roof is put on. The distributing point will be two reservoirs near the San Fernando Valley, 20 miles northwest of Los Angeles, which will be employed for regulating the distribution for irrigation during the dry season. At the end of the year some 5000 men were employed on this stupendous project and it was estimated that 80 per cent. of the cost would go for labor. In point of magnitude the new Los Angeles aqueduct with its 240 miles of length may be compared with the 122-mile water-supply system to bring water to New York from the Catskill water-shed. The construction of the latter, however, was estimated to cost \$167,000,000 as compared with \$24,500,000 for

pipe lines will extend to Staten Island under the Narrows and to the Borough of Queens. This plan was a substitute for one adopted in 1905, when it was determined to have a distribution system of cast-iron pipes passing under the East River and thence through the boroughs of Queens and Brooklyn to the distribution point. The tunnel at its commencement in Yonkers will be 300 feet below the surface and will then pass through the Bronx, Manhattan, and Brooklyn in solid rock for a distance of 17½ miles, the work being divided into 17½ sections averaging 4000 feet each. Each construction shaft will later be completed as an uptake shaft and connected to the present distribution system. The tunnel, which will be from 16½ to 11 feet in diameter, will be lined with concrete, and being overlaid by from 150 to 200 feet of sound rock will be both strong and water-tight, even under the high pressures to which it will be subjected. These uptakes of course will be connected with valves to the distribution mains and the shafts will be located as far as possible in

DISTRIBUTION SYSTEM OF CATSKILL AQUEDUCT. (From *Engineering Record*.)

the California project, and the engineering work, while difficult, not complicated with such factors as desert conditions, inaccessible mountains, and inadequate or impossible transportation facilities.

Active progress was made during 1909 on the actual construction work on the Catskill water supply for the greater city of New York and at the same time plans were completed for the distribution within the greater city, which were taken under consideration by the Board of Estimate and Apportionment. This part of the work involves all lines south of Hill View Reservoir, an equalizing basin near Yonkers into which the Catskill Aqueduct will empty, and consists of 17½ miles of deep-pressure tunnel and 16 miles of pipe line through which 520,000,000 gallons of water daily will be distributed to the five boroughs. Of this amount it was estimated that Brooklyn would require 100,000,000 gallons and Richmond 20,000,000, leaving 400,000,000 gallons for Manhattan and the Bronx. The proposed system consists of a pressure tunnel driven deep in the rock underlying the city and extending from the Hill View Reservoir, underneath Manhattan to Brooklyn at a point near the Atlantic Avenue station. From here

parks or open spaces where their construction will not obstruct street traffic nor their maintenance be interfered with by any present or future pipe or subway construction. The tunnel will have a capacity equal to thirty 48-inch pipes, while the cost, both of construction and maintenance, will be far less. Furthermore the supply thus delivered in lower Manhattan, Brooklyn and Richmond will be at a pressure sufficient to render unnecessary much of the private and public pumping in these boroughs caused by low-level reservoirs.

The proposition involves no more serious engineering than was being involved in the construction of the Catskill Aqueduct, especially those sections which were being built under Rondout, Walkill and Moodna valleys on the west side of the Hudson and under Croton Lake on the east, and in fact was of much the same nature as the proposed tunnel to cross the Hudson River. The plan was believed to have many advantages, one of which was that by constructing the tunnel from Manhattan to Brooklyn the latter borough could share in the Croton supply in the near future, before the final completion of the Catskill scheme, in case additional supplies were needed, while in the same way by the

immediate construction of the pipe line under the Narrows relief could be given to Richmond from the Ridgewood system of Brooklyn. Aside from this interesting proposal the work on the Catskill Aqueduct continued with vigor during the year and steady progress was reported from all sections where work was under way.

ARBITRATION AND CONCILIATION, INDUSTRIAL.

The year 1909 was a period of very considerable readjustment of the relations of employers to employees. The preceding year had been one of more than average industrial peace, owing largely to the recognition by union labor of the futility of attempting to better wages or hours during a time of industrial depression. But with the revival of trade the demands for new agreements became numerous and insistent, and led both to an unusual number of strikes (q. v.) and to a very considerable resort to conciliatory methods. These latter were employed especially in those industries in which the interests of the public are greatest, namely, transportation and the mining of coal. Under the Erdman act of 1898, which provides that, in case of dispute between a common carrier and its employees, the United States Commissioner of Labor and the chairman of the Interstate Commerce Commission shall endeavor by mediation to settle the difficulty, Charles P. Neill and Martin A. Knapp sought to terminate the strike of the firemen on the Georgia Central Railroad and that of the switchmen on the northwestern roads. They failed, but under the further provisions of that act, that in case of such failure, each party to the dispute shall, if he please, choose an arbitrator, and these two a third to constitute a board of arbitration, the former strike was settled and the latter was being negotiated at the end of the year. See **STRIKES**.

In the anthracite coal industry the three-year agreement expired on March 31, 1909. The operators offered to renew for three years more the agreement, which the Roosevelt Strike Commission had formulated in 1902. The workers, represented by the United Mine Workers of America, demanded the recognition of the union and the closed shop, the collection of members' dues by the company, an increase in wages, a reduction of hours, and an agreement for one instead of three years. To these points the operators answered that they could not recognize the union, because it was controlled by the bituminous miners; that increased pay would necessitate a raise in prices, which was impracticable; that to reduce the working day from nine to eight hours would increase the cost and reduce the output. After several months of consideration, during which there were several miners' conventions and numerous conferences between the representatives of the two parties, during which the miners had ceased work and the operators had given definite notice of a lockout, if the agreement were not signed, a new three-year contract was completed on April 29. The terms were: (1) The payment for new work at rates not below those paid for old work of a similar kind; (2) the posting of union notices and the collection of dues on the company's premises; (3) the right of appeal in the case of an employee discharged for being a member of a union; (4) the consideration of disputes at the colliery by the foreman and the mine superintendent before taking them to the conciliation board; (5) the issuance

by the employers of statements showing for each employee his own name and that of his company, the colliery where employed, the amount of wages, and the class of work performed. The union was not recognized, the agreement being signed by officers of the union not as such but merely as representatives of the miners.

ENGLAND. The use of conciliatory methods in Great Britain has increased greatly in recent years as a result of the stronger positions of the trade unions and growing public demand for the settlement of differences without inflicting undue injury upon consumers. Trade agreements now universally include provisions for conciliation boards made up of representatives of the two parties; moreover, both by legal enactment and by repeated practice, it is becoming more and more usual, in case the conciliation board shall not be able to agree, for the matter to be submitted to some distinguished personage for arbitration, his award being binding upon both parties. In this latter manner differences between the employees of the London and North-Western Railway Company, of the Great Northern Railway Company and of the Great Eastern Railway Company and these companies were settled for periods of three and four years, numerous points of wages and hours being dealt with. The introduction of the Coal Mines Regulation Act of 1908, providing among other things for an eight-hour day, went into effect July 1, 1909, and necessitated a readjustment of the working agreements in all the coal fields of England, Scotland and Wales. The consideration of differences was carried on in the various fields throughout the year, being attended by numerous cessations of work, threatened lockouts and the voting of two general strikes by the Miners' Federation. Nevertheless conciliatory methods were successful in every case, without a full test of fighting strength. Notable new agreements for conciliation boards were made by the men and operators of the London County Council Tramways, and by the masters and men in the cotton industry of the Lancashire district.

ARBITRATION, INTERNATIONAL. In the opinion of students of international law and of those interested in the cause of international arbitration, the most important development of 1909 was the action of Secretary of State Knox of the United States in recommending to certain of the Powers that the proposed International court of prize should be given jurisdiction to decide questions involving other matters of international dispute, thus establishing an International High Court of Justice, for which, in principle, the second Hague Conference voted unanimously. This action of the American Secretary brings the question into the arena of active discussion and consideration on the part of the countries addressed, and to that extent, at least, will advance the cause of a permanent High Court of Justice. The fact that the Hon. Elihu Root, as President of the American Society of International Law, devoted his last annual address to a discussion of the relations between international tribunals of arbitration and the jurisdiction of national courts affords further evidence of the growth of practical interest in the question. In concluding his address, Senator Root declared that the "better rule would be to avoid the danger of denials of justice, and to prevent the belief that

justice has not been done, which must always possess the parties defeated in a tribunal suspected of partiality, by submitting in the first instance to an impartial arbitral tribunal all such cases as are liable to be affected by the considerations I have mentioned."

Next in importance was the decision of the Hague Tribunal of the vexing Casablanca incident, which had been referred to the Court by France and Germany, the countries involved. This controversy grew out of the desertion and arrest in September, 1908, of six foreigners from the French foreign legion, and the alleged improper assistance given them by the German Consul. The Court, which was chosen to decide questions both of law and fact, consisted of Doctor Krieger and Mr. Fusinato, for Germany, and Professor Louis Renault and Sir Edward Fry, for France, with Knut Hjalmar von Hammarkjold, of Sweden, as president of the tribunal.

The case was argued in May, 1909, and the judgment handed down on May 22 was in favor of France. But "couched in such forms as would be palatable to Germany." The award taxes the secretary of the German Consulate at Casablanca with a "grave and manifest fault" in endeavoring to embark upon a German vessel deserters from the French foreign legion who were not German subjects (of the several deserters in question three were German and three were not). While the judgment was not such a one as might properly be expected from a court of justice, because of the antiquity and obscurity of the language used, nevertheless, as the editor of the *American Journal of International Law* has pointed out, "from whatever standpoint the award be considered, it is a great and notable international event because France and Germany have presented to a court of international arbitration a military question in which honor and vital interests are supposed to be peculiarly involved. War might easily have resulted, but the work of the first conference and an enlightened and insistent public opinion have forced the greatest of military powers to resort to arbitration for the peaceful settlement of international differences, which diplomacy had failed to adjust."

Both countries promptly accepted the sentence and the findings of the Court and joined in issuing the following formal statement (May 29): "Whereas the Imperial German government and the government of the French Republic agreed on November 10, 1908, to lay before a court of arbitration assembled for the purpose all the questions arising out of the occurrences which took place at Casablanca on September 25, 1908, and whereas both governments undertook to express mutually their regret at the action of their officials in accordance with the decision on the question of fact and of law which should be reached by the arbitrators, and whereas the court of arbitration at The Hague on May 22, 1909, recognized and announced the following:

"The Imperial German government and the government of the French Republic declare therefore each in so far as it is concerned that they express their regret for the conduct for which their officials are blamed in the award of the court of arbitration."

Another important precedent was the completion of the Swedish-Norwegian arbitration

of the dispute concerning the maritime boundary at the southern end of the border between the two states. The Grisbadarne Islands, a bank of considerable extent off the Koster Islands, are valuable as fishing grounds. They were claimed by both governments. The Hague Court awarded them to Sweden, Norway getting Skjøtte Grund. The boundary, as determined by the tribunal, is practically coincident with the old Swedish frontier line. The settlement is valuable, from an international view-point, as increasing the prestige of the Hague Court, and as strengthening the habit of appealing to law in international differences, especially in the case of nations where strained relations exist or have existed.

The arbitration treaty between Sweden and Norway runs for ten years and provides for the reference to the Hague Court of all questions of a judicial order and those arising in the interpretation of treaties. Questions affecting vital interests and national honor are reserved, although the question whether a controversy really involves vital interests or national honor must be first referred to the Hague Court.

The Central American Court of Justice handed down its first decision December 19, 1908, in the case of Honduras against Guatemala and Salvador, the charge being that the defendants had been guilty of unneutral conduct in that they had fomented revolution in Honduras. The Court assumed jurisdiction of the case, notwithstanding that the defendants pleaded that diplomatic negotiations, a condition precedent, had not taken place. The judgment pronounced rejected the action against "the high defendants, without sentencing them to payment of the costs." It is generally conceded that the decision prevented war, and represents a substantial gain for the cause of international arbitration.

Peru and Bolivia referred their boundary dispute to the President of the Argentine Republic, who decided generally in favor of Peru. Bolivia, at first, was averse to accepting the decision, and its President attacked the Argentine President, which resulted in July in breaking off diplomatic relations between the two countries. Wiser counsels prevailed, however, and in September, 1909, Bolivia decided to accept the awards as a final and conclusive settlement of the controversy, Peru, through diplomatic negotiations, making a few concessions. Thus has been concluded what at one time seemed would be a failure of a case of international arbitration. The incident also furnishes a precedent in favor of submitting questions to be arbitrated to The Hague, rather than to individual arbitrators.

Great Britain and the United States, on March 4, 1909, exchanged notes, agreeing to refer to The Hague the long-standing and at times annoying Newfoundland Fisheries question. The Court is to be composed of five arbitrators chosen from the panel of the Court, one from each of the two disputing nations, and three from foreign countries. In this way what has been a menace to the friendly relations of the two countries has at last been put in the way of a peaceful and satisfactory settlement. The documents have been filed and the Tribunal is expected to meet in May, 1910. In the meantime, a *modus vivendi* between the countries has been agreed upon. President Taft, in his annual message to Congress, declared that the case is the first one involving such great

international questions to be submitted to the Hague Court.

Venezuela and the United States submitted to The Hague three of the questions which resulted in the severance of diplomatic relations in 1908. The cases are to be tried and argued early in 1910. The other arbitrations completed or undertaken during the past year are:

Mexico and France have arbitrated the question of the sovereignty of Clipperton Island, the King of Italy acting as arbitrator; Brazil and Bolivia have accepted the decision of an individual arbitrator in a boundary dispute; the United States and Chile have submitted to the decision of King Edward of Great Britain the Alsop claims controversy between them. The decision is pending. Chief Justice Fuller of the United States Supreme Court has undertaken the arbitration of a boundary controversy between Costa Rica and Panama; the Central American Court of Justice has received its second case, but was compelled to dismiss it for lack of jurisdiction.

At least twenty new treaties of obligatory arbitration have been concluded during the year between nations two and two, bringing the number up to ninety-five and the nations parties thereto to thirty-five. The United States has treaties with twenty-five nations. The treaties signed in 1904 have expired; but they have practically all been formally renewed for a further period of five years. One of the interesting treaties is the one with China, inasmuch as it recognizes its equality and its claim to a like treatment with other nations. Another equally interesting treaty is the one concluded with Austria-Hungary, one of the countries at the second Hague Conference which objected to the submission of a compromise provided for by a treaty to any legislative or internal body. The new treaty provides for just such submission.

Interest in the cause of international arbitration on the part of business men and business organizations continues its encouraging growth.

At the Mohonk Conference of 1908 the business men present, representing a long list of leading business organizations, unanimously adopted this resolution:

The men representing business organizations in various parts of the country recognize the fact that international arbitration as a substitute for war between nations is a potential proposition; that popular education should be encouraged as the best means to hasten the day of a World's Court of Justice; that the business men, being vitally interested in this, the greatest cause of humanity, feel it their duty to assume a large share of the financial burden of this educational campaign. They appreciate, further, that they should give time and serious thought to the problems confronting those who are now engaged in the international arbitration movement.

The American Peace Society has formulated a concrete programme of effort, of which the following are the more important planks: 1. A world treaty of obligatory arbitration. 2. The establishment of the Court of Arbitral Justice provided for by the second Hague Conference and awaiting only the appointment of its judges under some form of international agreement. 3. (a) A protest against further increase of the United States navy as unnecessary for our protection and as tending to aggravate the rivalry of the nations in building costly arma-

ments. (b) The leadership of the United States government in an effort to bring about by international agreement a limitation and reduction of armaments. (c) As a preliminary step to this end, the appointment of an official national commission to study the question of armaments with a view to a practical international discussion at the third Hague Conference. 4. Appropriations by the national government for the promotion of international hospitality and peace. 5. Regular periodic sessions of the Hague Conference for the discussion of the common interests of the nations.

Among the many encouraging events of the past year making for better international understanding and relations may be noted the Declaration of the International Naval Conference of London, whereby many technical causes of past international disputes have been removed; and the International Prize Court provided by the Hague Conference of 1907, established on a working basis; the peaceful outcome of the threatening Balkan crisis; the signing in Washington of an agreement looking to the peaceful determination of all existing and future differences between the United States and Canada; the establishment in the American State Department of a Latin American Bureau, in recognition of the increasing international relations with our Southern neighbors; the continued and greatly increased international exchange of teachers; the establishment by the Interparliamentary Union of a permanent office whose final headquarters will be in the Palace of Peace at The Hague; the visit to England of the civic authorities of Berlin as guests of the City Corporation of London; the similar visit to Germany of more than fifty British clergymen; and the noteworthy reception by this country of the fifty distinguished representatives of the commercial bodies of Japan.

An International School of Peace has been established in Boston for the education of the people in behalf of "international justice and fraternity." Edwin Ginn of Boston has announced his intention to give to it \$50,000 a year and to endow it after his death.

The Second National Peace Conference held in Chicago May 3-5, 1909, was a great success in bringing together a representative gathering and in formulating the needs of further educational work to strengthen public sentiment for peace and international arbitration. Four of the addresses (those of Congressmen Tawney and Bartholdt, Mr. Andrew Carnegie and President Nicholas Murray Butler of Columbia) were reprinted in the *Congressional Record* under the authority granted by the House. They dealt with the general question of "The Mission of America in the Politics of the World."

The Congress brought together delegates from thirty-two States, mostly those of the Middle West and the South, and had a total membership of 560. A series of strong resolutions were adopted, including the following:

"Resolved, That this peace congress expresses its high appreciation of the action of our government in the recent conclusion of twenty-three arbitration treaties, and in the promotion of friendly relations between the various American republics. It recognizes with special satisfaction what was done by our government and representatives of the second Hague Conference in behalf of a general treaty of obligatory arbitration, a court of arbitral justice, the im-

munity of private property at sea from capture in time of war, and the establishment of a periodic congress of the nations, and in support of the proposition of the British government for limitation of armaments."

The publication department of the American Branch of the Association for International Conciliation published the following leaflets during 1909: *The Logic of International Co-operation*, by F. W. Hirst; *American Ignorance of Oriental Languages*, by J. H. De Forest; *America and the New Diplomacy*, by James Brown Scott; *The Delusion of Militarism*, by Charles E. Jefferson; *The Causes of War*, by Elihu Root; *The United States and China*, by Weiching Yen; *Opening Address at the Lake Mohonk Conference on International Arbitration*, by Nicholas Murray Butler; *Journalism and International Affairs*, by Edward Cary; *Influence of Commerce in the Promotion of International Peace*, by John Ball Osborne; *The United States and Spain*, by Martin Hume; *The American Public School as a Factor in International Conciliation*, by Myra Kelly; *Cecil Rhodes and His Scholars as Factors in International Conciliation*, by F. J. Wylie; *The East and the West*, by Seth Low.

The Nobel Prize for 1909 was awarded to Baron d'Estournelles de Constant of France and Auguste Beernaert of Belgium, being equally divided between the two (qq. v.).

The Fifteenth Annual Lake Mohonk Conference on International Arbitration met May 19 to 21, 1909. As in previous years the sessions were very largely attended by a representative group of delegates. The address of the chairman, Dr. Nicholas Murray Butler, outlined the progress made within the last few years and discussed the causes which threaten the world's peace at the present day, including the strained relations between Great Britain and Germany, based, in Dr. Butler's opinion, upon a misunderstanding of each other's motives. Among other recommendations the conference urged upon the American government its early initiative in the establishment of the International Court of Arbitral Justice, and a negotiation of a general treaty of arbitration between all nations.

The International Opium Commission convened at Shanghai on February 1, 1909. See CHINA, paragraphs on *History*.

An Ibero-American Institute of Comparative Positive Law has been organized at Madrid by a number of distinguished Spanish publicists and jurists occupying high professional and civic stations. Its principal objects are to "facilitate frequent and mutual communication between professionals and juridical societies, to stimulate among the Ibero-American people the study of the juridico-social problems of present interest, seeking to unify or harmonize, so far as possible, their solution."

The Fourth Pan-American Conference will meet at Buenos Ayres in August, 1910. A tentative programme has been prepared by a committee appointed by the Governing Board of the Bureau of American Republics. The last conference was held in Rio de Janeiro in 1906.

The American Society of International Law at its third annual meeting, April 23-24, 1909, discussed "Arbitration as a Judicial Remedy: An examination of concrete cases actually submitted and decided by arbitration; how far they are of a judicial character and how far they have been governed by diplomatic convenience;" also,

"The Constitutional Powers which an International Court of Arbitral Justice Should Possess," the principal speaker on the latter topic being Senator Theodore E. Burton, of Ohio, who pointed out that the powers of such a tribunal would necessarily be limited at the beginning.

"In a majority of the numerous arbitration treaties already negotiated questions of national honor and vital interest have been reserved from decision. With the growth of an international sentiment for peace and with an increasing confidence in the decision of the tribunal a larger number of questions would be withdrawn from the domain of national honor and vital interest and freely submitted to arbitration. Every factor which goes to make up modern progress and civilization will stimulate the desire for orderly and peaceable adjustment of international controversies."

Among the more important publications of the year is James Brown Scott's *History of The Hague Peace Conferences of 1899 and 1907* in two volumes. Dr. Scott, as solicitor of the State Department and as expert of the delegation to the second conference, is peculiarly well qualified for the task.

ARBITRATION, LABOR. See ARBITRATION AND CONCILIATION, INDUSTRIAL.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. A learned society, founded in Boston in 1879 and incorporated by Act of Congress, 1906. Its purpose is to promote archæological research by founding schools and maintaining fellowships, by conducting excavations and explorations, and aiding in those conducted by others, by publishing the results of archæological research, by holding meetings for the presentation and discussion of archæological subjects, and by maintaining courses of public lectures. The activities of the Institute have been extended to various fields of archæological interest, especially Greek, Roman, Oriental, American and Renaissance. It has conducted excavations on the site of the ancient Assos in the Troad, and has aided in the investigations of the schools established under its auspices; it has also directed researches in the United States, Mexico and Central America. The Institute publishes *The American Journal of Archaeology*, which contains original contributions, reports and summaries of archæological work in all parts of the world, and a bibliography of archæological books. Four numbers are issued each year, together with a Supplement, which contains the annual reports of the Institute and of the schools. The schools under the auspices of the Institute are the American School of Classical Studies at Athens, established in 1881 and incorporated in 1886; the American School of Classical Studies in Rome, organized in 1895; the American School for Oriental Study and Research, founded in 1900; and the School of American Archæology, founded in 1907. The Carnegie Institution of Washington supports a fellowship in architecture in the American School of Classical Studies at Athens, and grants \$1500 annually for excavations. The Institution also maintains two fellowships for research in the American School for Classical Studies in Rome and grants \$1000 annually for publication. The American School for Oriental Study and Research has done important work of exploration in Palestine. An effort is being made to raise money to pur-

chase a permanent building in Jerusalem, and the Institute has already contributed to this end. The School of American Archeology directs all the researches of the Institute in the American field and affords opportunities for field work and training to students of archaeology. Excavations have been conducted in Colorado, Utah and New Mexico. A fellowship for study in Central America is maintained. The Committee on Medieval and Renaissance Studies promotes investigations and provides for lectures in mediæval and Renaissance archaeology and art, and the Institute maintains a fellowship in these subjects. The Institute is composed of twenty-one affiliated societies. The total membership is about 2000, consisting of life members and annual members. The officers in 1909 were: Francis W. Kelsey, President; Seth Low and John Williams White, Honorary Presidents; Charles P. Bowditch, Allan Marquand, George F. Moore, William Petersen, Edward Robinson, and F. B. T. Tarbell, Vice-Presidents; Mitchell Carroll, Secretary; and William Sloane, Treasurer. The Directors of the Schools of the Institutes are as follows: American School of Classical Studies at Athens, Bert Hodge Hill; American School of Classical Studies in Rome, Jesse Benedict Carter; American School for Oriental Study and Research in Palestine, Robert Francis Harper; School of American Archaeology, Edgar L. Hewett.

ARCHÆOLOGY. While 1909 saw no startling discoveries in the field of archaeology, the work in the various branches was carried on consistently in such a manner that many valuable data have been accumulated. On almost all of the sites mentioned in last year's report the work continued. In one or two instances certain places, as will be seen, have been cleaned up, and the excavations terminated.

MESOPOTAMIA. The German excavations at Babylon, November 1908-April 1909, have been in that part of the town now known as Merkes. In the course of the work a large part of the residential part of the city of the time of Nebuchadnezzar was laid bare, and some distinctly interesting private houses discovered. The upper strata, as already known, belongs to Hellenic times, and here on the walls of a house was found a painting. In the process of excavation terra-cottas, vases, and cups were found.

At Assur, where work has been in progress for a long time, diggings have been made in an east and west direction across the district of the former city. As a result, great monumental buildings, decidedly worth excavating, have been located.

The most noteworthy finds up to now have been a great number of private houses dating from Parthian, late, middle, and old Assyrian as well as archaic times. Those of the old Assyrian period are especially well preserved. Small objects of all sorts, such as vases, bronzes, and clay tablets, have been recovered in large numbers. An important find of late date is that of parts of Assyrian basalt columns, eight-sided, and some sixteen-sided. The eight-sided fragment is especially valuable inasmuch as it has an inscription on it dating in the eleventh century B.C.

SYRIA AND PALESTINE. At Gezer the excavators have discovered another cave-cemetery. It consists of a chamber about twenty-five feet

square and seven feet high, and in it were the remains of four persons. The most interesting of the finds consists of three specimens of a peculiar type of "Astarte-plaque." The face of the goddess is strongly marked and wears a veil with an embroidered border which covers the head and falls over the shoulders. The figure exhibits an abundance of ornament. An unusual feature is that each hand has six instead of five fingers.

Excavations on the supposed site of Jericho, near Ericha, and not far from the Dead Sea, have produced interesting results. The city wall was found to consist of a foundation of well-laid rubble, with larger stones at the bottom, upon which rested a wall of sun-dried bricks. Inside the wall was a doubly walled citadel and below this were the remains of about thirty houses in a good state of preservation. These houses faced on a narrow street. The site was occupied from about 2000 B.C. down to the beginning of the Christian era.

The recently published reports of the Harvard expedition to Samaria now make it possible to review the work done on this site. Near the village what was probably a Roman temple was uncovered, while on the citadel more important results were obtained. Here at a depth of thirty feet was found a massive wall which is probably of Hebrew date, while another cutting revealed two cisterns, a plastered drain and the remains of ancient buildings. At the top of the hill was uncovered an imposing staircase, originally eighty feet broad and still existing to the height of sixteen steps. In this neighborhood the excavators discovered a platform now about fifty-seven by twenty-seven feet. Below this were encountered remains of earlier walls. The only sculptures recovered were a Roman torso, probably of Augustus, and fragments of a large head. A few Greek graffiti and numerous fragments of Latin inscriptions were found as well as bits of painted stucco with Greek letters on them.

At Nazareth in Galilee an important discovery has been made. Under the church of the village have been found substructures of the ancient basilica, and among other objects were recovered five polygonal capitals which have on the four faces a number of allegorical scenes illustrating the evangelic narratives.

In an interesting article recently published P. Haupt holds that the Hamath, which was conquered by Tiglath Pileser III. and then settled with Assyrian colonists, was not, as is usually believed, the Hamath in Northern Syria, but that one located in Galilee. The colonists who were settled here were of Aryan stock brought from Media, and it is from these people that the later population of Galilee was descended. Although they were Jews in religion they were not in race. If this is true then Jesus and his disciples are to be considered as of Aryan and not Semitic descent.

EGYPT. At Abydos the Egyptian Exploration Fund expedition has excavated a temple of Thothmes III. lying between the temple of Rameses and the temenos of Osiris. Near Abydos Garstang has opened a number of fifth or sixth dynasty tombs which exhibit a mode of burial which has not yet been recorded. In the case of both men and women the bodies lie upon their backs with the legs crossed. The coffin was of wood and on the middle of the lid rested a large inverted shallow vessel of red polished

ware. The bodies were not mummified. In the coffin with them were frequently found a copper mirror, alabaster vases and small pots, as well as, sometimes, a number of copper implements.

The chief discovery made by Petrie at Memphis was that of the palace of Apries. This king is the Hophra mentioned in the Bible and was a contemporary of Jeremiah. The size of the palace can be appreciated from the fact that it measured about two hundred by four hundred feet, that it had a central court which was over one hundred feet square, and was elevated on a platform which rose about sixty feet above the plain. The halls were roofed over by beams of cedar. Of especial interest was the discovery, in a hole in the floor of a hall, of a silver bust of Hathor which weighed a pound. This was used as a strap attachment on a palanquin and gives some impression of the luxury of those who once dwelt in this palace. The temple of Merenptah, which was discovered last year, has now been partly cleared.

While waiting for Memphis to become dry enough to allow excavation to go on Petrie put in two months in the neighborhood of Thebes in examining the locality. On the top of the mountain was found a chapel for the apotheosis of the eleventh dynasty king, Sankh-ka-ra. Besides this find a group of concealed burials, one undisturbed, were discovered in one of the desert valleys. The coffin of the unmolested group was covered by a thin layer of earth and stones only a foot and a half in thickness. Around the coffin were offerings of personal ornaments, food, furniture, etc. On the mummy itself were found an electron girdle, a gold collar consisting of four rows of rings, earrings, and four gold bangles.

The Expedition of the Metropolitan Museum of New York City resumed its season's work at Lisht in November, 1908, by clearing the twelfth dynasty tombs in the cemetery at the side of the pyramid of Amenemhat I. In February the main programme was entered upon when the excavation of the causeway and temple of the pyramid of Sesostris I. was undertaken. The causeway which led from the river valley to the temple proved to be a roofed passage of limestone 2.80 m. wide with its side walls painted at the bottom to imitate red granite and decorated above with colored relief. Excavations on the site of the temple itself have made it clear that it conforms in general with the usual Old Empire pyramid-temples in being approached by a causeway which leads into an entrance hall which in turn leads into the colonnaded court. During the excavation of the temple much well-preserved colored relief came to light. In the Oasis of Kharga the expedition has continued its work on the Christian Necropolis and the ancient town of Hibis. This town was the residence of the Governor and the most important place in the oasis. Here the excavations have exposed several new streets and houses which were built on a rocky knoll. Finds of coins make it evident that the town was still inhabited as late as the close of the fourth century A.D. Among the most interesting of the finds on this site are a series of small limestone altars in the form of a column with a basin at the top for fire, and a group of plaster statuettes of which the most typical is that of a seated male figure. The drapery was colored.

At Meröe the discoveries by Sayce of remains of the Temple of Amon show a surrounding wall of dressed stone. The temple was approached from the east by a road which was flanked on each side by rams. On the site of the temple were discovered a life-sized royal statue as well as an inscription of King Axum, who apparently was the one who was responsible for the overthrow of the king of Ethiopia. The mounds at Meröe are as extensive as those at Memphis. From Messaurat en Naga Professor Sayce has recovered, he believes, the key to a partial decipherment of the Ethiopian writing.

Among the interesting objects of Egyptian provenance is a sketch book, dating in Greek times, which has recently been acquired by the Berlin Museum. The papyrus is divided by red lines into small squares and the figures are sketched in with red or gray and then completed in black. The subjects represented are a hawk-headed lion, a swallow, a rooster, a seated king, etc.

GREECE. The activity of the Greeks has been in two directions. Not only have they continued their wise policy of restoring their ancient monuments so far as the existing remains safely allow, but they have as well made a considerable number of excavations on various sites. In reference to the first field of their work it should be noted that the area in front of the Beulé Gate has been cleared and the approach to the Acropolis improved. On the Acropolis itself the restoration of the Erechtheion is completed and that of the Propylaia inaugurated. In the work on both of these buildings the American School of Classical Studies in Athens has contributed much. Outside of Attica the Greek Society has also been active. Much work has been done in restoring the temple of Apollo at Phigaleia, in the process of which terra cotta remains of an older building have come to light; the Hieron at Epidaurus has been improved, and the so-called tomb of Clytemnestra at Mycenæ has been strengthened. In the matter of excavation should be mentioned first the work of the Greeks in the neighborhood of the Theseum in Athens. Last year a start had been made and this year's work has shown that the locality was used as a burial ground during the time that the temple was used as a church. As a result the earth has been greatly disturbed since ancient times. At New Phaleron Stais discovered the sanctuary from which the Echelos relief of the National Museum came. In Ætolia and Akarnania Soteriades has carried on work for the Greeks with the result in Koronta in southern Akarnania Mycenaean tombs have been discovered, in which were bronze and terra cotta ornaments. At Sounion Stais has continued his work of last year and found a very ancient temple with the base of the cult statue still in its original position. From the shore to the great temple was found a road with houses on either side. In the island of Naxos a number of tombs of the known Cycladic type have been located near Komiaki. In Thessaly a small temple has been found at Itonos, while in the Acropolis of Pthiotic Thebes early geometric pottery with white filled incision has been recovered. In Kephallenia twelve late Mycenaean tombs were discovered. They are rock-cut and the burial is the contracted variety found in the Cyclades. This find shows that

Mycenæan culture extended far to the west. At Samé in the same island were found seventy-two undisturbed pre-Mycenæan burials. At Pagase in Thessaly further research has brought to light five more towers, of the sort reported in 1908. One of these was filled for a space of thirty metres with grave stelai of the painted type recovered last year.

Crete has nothing spectacular to exhibit this year. At Knossos Evans discovered near the Royal Tomb a sepulchral chamber of stone dating in the Middle Minoan III. period—that is, about 1800 B.C. Among other objects found in the tomb should be mentioned an intaglio mounted in gold and showing a Molossian dog and two men, and a gold ring with four dancers analogous to those of the small frescoes of Knossos. In the small palace to the west of the great palace was found the lower part of an Egyptian chased vase dating probably no later than the thirteenth dynasty.

The discovery of an inscribed terra cotta disc, mentioned in the reports for 1908, has led the Italians to continue investigations in the neighborhood of its place of discovery, that is, near the palace at Phaistos. To the south of the great court on the western side of the palace were found remains of houses of Hellenistic date, while below them were discovered specimens of Kamarae ware. At the level of the court of the palace came to light a small cistern and an older well, both of which were of the time of the older palace. On the northeast slope of the Acropolis was uncovered a building with a portico which opened to the north. Opposite it is a flight of steps, eighteen in number, leading up to the eastern court of the palace. The portico dated in the latest Middle Minoan style. On a part of the Acropolis have been found potsherds dating from Geometric to Hellenistic times. Below these potsherds Minoan fragments have been discovered.

At Tylissos, which lies four hours west of Knossos, a settlement dating in the Minoan period has been discovered. Here, among other objects, have been found inscribed tablets and stone seals. Judging from the great pithoi, a bronze hydria, and a large bronze vessel found on the site, the settlement dates in the late Minoan I. or Middle Minoan III. period. Near Gortyn the same excavators, the Greeks, have begun to excavate a sanctuary the finds from which date chiefly in the second and third centuries B.C. A large number of terra cotta lamps and many clay figurines have been found. About two hours north of Gortyn the excavators have discovered a prehistoric site.

At Delos, where the French are engaged, the ancient quay and mole have been cleared. Finds of Mycenæan and Geometric pottery near the mole show the antiquity of the structure. The quays are much later in date, and belong in part in the Archaic and in part in the Hellenistic period. During an examination of the course of the Inopos a large cistern of late third century date was found. The basin was the source of supply for an elaborate system of canals. Besides this cistern a public fountain has been located at the northeast corner of the Stoa of Antigonos. The structure presented a hexastyle Doric façade, and was of wood faced with terra cotta. The date of the building is the early fifth century. On the evidence of an inscribed relief the fountain is

identified as the Minoan Spring. The temenos is now completely excavated.

At Olympia the German excavations have made it clear that the oldest remains on this site consist of a prehistoric settlement which extends from the Metroon under the terrace of the Treasuries. This terrace is artificial. The buildings of this early settlement are of the same apsidal construction as that of the buildings, reported in 1908, found last year near the Metroon. What, indeed, was supposed to be the Altar of Zeus is apparently only two such structures taken together. The settlement belongs entirely in the Neolithic age, and from the fact that it is covered by a layer of sand it is supposed to have been destroyed by a flood. Near Pylos have been recovered the foundation and some porous architectural members of the temple of Artemis Limnatis. From these can be drawn the reconstruction of the building. At Samikon some prehistoric monochrome pottery as well as Mycenæan ware has been found. Dörpfeld would call the site Arene. At Tiryns much has been done. In the southern part of the Upper Citadel remains of a pre-Mycenæan settlement came to light. This is characterized by the peculiar black-lustre ware. Under room xxx. (Schliemann, *Tiryns*, pl. ii.) were found six large pithoi belonging to this time. The buildings with their curved walls offer analogies with the early buildings found at Olympia. All around the citadel traces of the lower town have been found. From the finds it is evident that immediately below the citadel at the southern end was the older part of the town, dating from the black-lustre ware in prehistoric times, while the later part of the town, to the north, belongs in the late Mycenæan times. The succeeding Geometric period at Tiryns is represented by many tombs. At Leukas Dörpfeld believes he has found a building belonging to the palace of Odysseus.

The British School has just completed its excavations of the temple of Artemis Orthia at Sparta. The work in 1909 consisted in clearing up the outlying portions of the sanctuary. After removing part of the pavement in the centre of the arena of the Amphitheatre the English scholars found under it ashes and geometric potsherds which demonstrated that the worship of Artemis was much older than the structures on the spot would lead one to believe. Among the noteworthy archaic objects found are an ivory fibula plate representing Artemis with a snake, and a relief in stone showing two lions arranged heraldically. According to the excavators the latter may be a copy of the pediment of the sixth century temple from which two years ago a colored relief in porous showing a lion was recovered. A little below Sparta on the east bank of the Eurotas excavations have been conducted by the English on the site of the Menelaion, so-called. Here much pottery and many bronze ornaments were found which date for the most part at the end of the seventh century. This is a time scarcely represented at the sanctuary of Artemis. Below these came Geometric fragments, and at a low level some Mycenæan potsherds. In a neighboring field were discovered remains of a Mycenæan pottery with frescoed walls. Near by Mycenæan pottery was found on the surface of the ground. All this affords proof of a Mycenæan as well as a Dorian Sparta; and it is likely that the older settle-

ment was at this place while the later was on the classical site.

In other parts of Greece the English have been active as well. At Rhitsóna, the site of ancient Mykalessos, Messrs. Burrows and Ure opened twenty graves and recovered as many as 2400 sixth century vases and figurines. These excavations are being exhibited at Thebes, grave by grave, so that an excellent opportunity for study is offered to students. In Thessaly the British school has opened two prehistoric mounds. In one of the mounds, that at Lianokladi, three strata were discovered; the lowest showed a red-on-white ware, the next the characteristic black-lustre, and the top a coarse red hand-made ware, showing black-paint geometric patterns. In the other tumulus, near Kierion in western Thessaly, eight strata were noted. A long series of wares, including nine styles, were found, but here, as in the other tumulus, the red-on-white ware was early and succeeded by the black-lustre style. It is believed that the black-lustre ware, which is at home in Orchomenos and Tiryns, shows that these neolithic people who made the red-on-white style were invaded by those from the south who used the black-lustre style. This latter style does not last long and is succeeded by Mycenaean civilization. The dates for these tumuli are suggested as 1100-2500 B.C.

The American School is still engaged in its work at Corinth. The foundations of a Roman temple have been found near the marketplace. Outside the latter a part of the road to Sikyon has been made out. This makes certain that the old temple on the right of this road is that of Apollo, for here Pausanias noted this building. The theatre and the paved court between it and the Odeum, which was found in 1907, have been cleared. Most interesting of all, however, is the discovery of the channels of the fountain of Peirene, its surrounding court and the very early reservoirs and basins which probably belong in the time of Periander.

At Pergamon the Germans are continuing their work. Here Dörpfeld has begun the exploration of the temenos of Demeter and is continuing that of the Baths. At Ephesus under Heberdey the Austrians are at work in the valley between the Billbill Dagh and the Panyir Dagh. Their efforts have been concentrated on the Odeum, which has been completely cleared. It is of the regulation Roman type. The so-called tomb of St. Luke has been excavated and found to be the lower part of a circular building of which the use is unknown. This served as a chapel in Christian times. Besides doing this work the Austrians have investigated the water conduits on the site. At Miletus the entablature and columns of the northeast corner of the temple of Apollo were found just as they had been deposited by the fatal earthquake which destroyed the temple. The frieze of the building is adorned with Gorgoneia more than three feet in height. On this same site baths and a Roman temple dedicated to Egyptian gods have been discovered. A bust of Helios was also found. The Austrian expedition to Lydia under Keil and Von Premerstein led to valuable results in the discovery of about three hundred and eighty inscriptions, some of which are in old Lydian characters.

Among the archaeological studies of the year one of the most interesting is that of Pomtow on Delphi. This scholar asserts that he has

identified the Treasury of the Corinthians with the structure which Homolle believed to be the base of the chariot dedicated by the city of Cyrene.

Under the foundations of the Treasury of the Sikyonians the same scholar uncovered the Tholos of Sikyon—which can be completely restored as a structure consisting of thirteen slender columns, without any inner wall, posed on a circular platform 6.40 m. in diameter. In front of the building was probably a small portal with four columns.

Another ingenious piece of work is that of Hill and Caskey, who have demonstrated that across the western end of the eastern hall of the Erechtheion ran a wooden beam supported by two struts which rested on corbels let into the north and south walls.

Still another interesting study is that of Dinsmoor, fellow of the American School in Athens, who has shown that the Propylaia of the Acropolis in Athens had a roof at a higher level over the east portico than over the main hall.

ITALY. In the *Lucus Furrinae* at Rome Gauckler has discovered a Syrian sanctuary dating in the first century B.C. From this it is evident that the Syrian cult was established at Rome at a much later date than is usually believed. In the course of the work, curious specimens of faience of yellow, green, and blue colors were discovered. They are surely of Babylonian or Chaldaean origin and are the first instances occurring in a monument dating in the Imperial period. From the same excavations came an image which Gauckler thinks can be identified as that of the Syrian Atargatis. In the same grove has been found the dedication of the Temple of Jupiter Heliopolitanus.

In the Forum at Rome Boni has already explored the last two tombs belonging to the prehistoric necropolis. In them he found great jars which contained hut-urns filled with bones and ashes. These tombs are assigned to the eighth and even as early as the twelfth centuries B.C.

From a large number of tombs at Populonia, dating in the third and fourth centuries B.C., many objects have been recovered. From one tomb, that of a young girl, came a gold diadem in the form of olive leaves with a great rose in the middle, and a head at each end. Among the other objects recovered by the excavation was an excellent bronze statue representing the suicide of Ajax. At Ostia, in a street connecting with the Street of the Tombs, a sanctuary of Jupiter Sabazius has been recently discovered. This divinity is identical with the Phrygian Sabazis. In the same town a fine statue of Ceres was found.

At Pompeii, on private property and within two hundred yards of the place where the government is excavating, an exceptionally fine villa has come to light. It contains several rooms besides a large dining-room which is elegantly decorated. The paintings are of exquisite workmanship, and show a Silenus giving a drink to a thirsty man who bends eagerly before him, a reclining figure, which may represent Ariadne, and a Victory striking at a defeated woman for whom one companion intercedes, while another beats a pair of cymbals together.

On the island of Matya, off Sicily, a Phoenician settlement is being excavated. The walls uncovered are of two kinds, Cyclopean, and of

well wrought stones. Two massively battlemented gates and two stone staircases have been found. At the southern end of the island have been discovered what is apparently the harbor and a narrow channel leading out from it.

The Roman authorities have in hand an elaborate scheme, for which 600,000 livres were appropriated in 1908, for excavating the territory known as the "monumental zone." This zone comprises the space between the Arch of Constantine, the Porta Ostiensis, and the Porta Latina, and includes the Baths of Caracalla, and the declivities between the Coelian and Aventine hills. According to this scheme it is proposed to clear up the most ancient foundations near the Arch of Constantine, the Via Triumphalis, and to investigate the remains of the monument of Septemius Severus.

FRANCE. On Mt. Auxois, a sanctuary of Hygieia or Demeter has been uncovered. There are representations of a cock-fight as well as of other animals. At Mt. Guerin excavations have brought to light three fragments of Greek amphoræ, and so demonstrated the existence of commercial relations between this place and the Mediterranean. In the commune of Salins, in an *oppidum*, fragments of black-figured and red-figured Greek ware were found in conjunction with bronzes and other objects of the third Halstatt period.

SERIA. At Vinca, on the Danube, excavation conducted by Vassits showed a series of strata, which, in the oldest exhibit anthropomorphic vases which resemble those of the second city at Troy, while the upper strata contained objects similar to those found on prehistoric sites in Hungary, Roumania, Bulgaria, Thessaly, and even Crete.

INDIA. At Takht-i-Bahi, in the Peshawar Valley, Dr. Spooner found a stone of peculiar greenish color decorated on its four sides with scenes from the life of Buddha. The stone is pierced through the centre, and, evidently, was the pediment of a *Stupa*. According to Spooner a more perfect specimen from this cycle of the Mahaparanirvana does not exist. Neat Peshawar, the same scholar also found a headless statue of a goddess with four arms. This number is unusual in Gandhara Art.

ARCHÆOLOGY, AMERICAN. See ANTHROPOLOGY.

ARCHITECTURE. The year 1909 can claim to its credit no specially forthcoming achievement in architecture, but rather a general progress in the art in all the countries in which large building operations have been general for some years past. Among European countries France, Germany and England have led in the amount, quality and importance of new constructions, with Austria and Italy following not far behind. The Low Countries and the Scandinavian kingdoms follow next, while Spain, Russia, Greece and Turkey bring up the rear. No European nation, however, can compare with the United States in the amount and cost of new buildings begun, completed or under erection during the year; and there are those even in Europe who consider the American work to stand first in quality as well as in amount, taken as a whole. This, however, is not by any means universally conceded, although the virility, versatility and originality of the work of the American designers is quite generally acknowledged.

In EUROPE one looks first of all to France for interesting developments in the year's output of architecture. The results there are somewhat disappointing. No very notable edifice has been begun or completed during the year. Among the most important enterprises under way has been the continuation of the work on the great Church of the Sacré Cœur on the Montmartre hill in Paris, by the erection of the great eastern tower over the domical Lady Chapel. This has been carried on under the direction of M. Lucien Magne, upon a design based in a general way on the sketches left by the late M. Abadie, the original designer of the church. At the end of the year the tower was about three-quarters finished. It is a dignified and superbly constructed work, worthy to complete what is, internally at least, the most impressive of modern ecclesiastical structures. The stained glass in the newer windows, in part the work of a son of M. Magne, marks an interesting and successful new departure in the use of broad, frank masses of strong color.

Except for a projected annex to the Ministry of Marine, for which a competition was held during the year, and the erection of an annex to the Credit Lyonnais, by A. Narjoux, there has been little or no important work of a public character begun in Paris. The onward march of apartment-house building, however, goes on apace. Most of the houses betray the influence of the Art Nouveau movement, purged, however, of the extreme vagaries and extravagances that were common a few years ago. Bay-windows and heavily-corbelled balconies are frequent; the roof masses far more varied and picturesque than formerly, and the sculptured detail, especially of naturalistic flowers and foliage, often very beautiful. As a whole, however, these modern structures lack the charm and elegance often found in buildings of more conventional design.

While no very important public buildings have been under erection during the year, a very important and interesting structure has been in part demolished. This is the great Galerie des Machines, erected in 1889 at the rear of the Champ de Mars for the exhibition of that year—the finest, certainly the most elegant, of all modern metal-roofed halls of wide span. It is being removed to make room for two permanent exhibition halls of less unmanageably vast dimensions. Among other municipal enterprises should be mentioned the Boulevard Raspail, begun many years ago, but only recently carried on with vigor by the demolition of old houses in the southern half of the city. The past year has witnessed the virtual completion of this great new thoroughfare.

In other French cities there has been about the usual activity in the building of theatres, town halls, prefectures, courts of justice, schools and hospitals; among them the hôtel-de-ville at Roubaix, by V. Laloux, and the Post Office at Dijon, by Perreau. The city of Lyons is about to begin the erection of an immense stock-yard, cattle market and abattoir, covering many acres, for which the plans by Tony Garnier were exhibited at the Salon of 1909.

In the field of French architectural archæology, 1909 has had no very notable annals to offer. The Cathedral of Chartres has been undergoing careful restoration as to its wonderful North porch, the South porch having been thoroughly repaired and relieved of its long-dis-

figuring shorings in recent years. The little Romanesque Church of Morieuval, so important archaeologically in spite of its modest dimensions, has been stripped of the late and debased porch at the West End, which—so far, at least as appearances indicate—was originally without doors, its three arched entrances being entirely open to the exterior world. These restorations and others of less importance are being directed by M. Selmersheim, the accomplished architect of the Commission des Monuments historiques.

In GERMANY there has been about the normal activity in building, on the whole a stronger movement than in France. Particularly has the movement for municipal improvement assumed important dimensions. With great foresight, many of the German cities are planning, in advance, for the future development of their suburban districts, while others have held competitions for the remodeling of the older parts of the city proper. In the twin cities of Hamburg-Altona, the entire railway terminal system has been reconstructed and remodeled, a new *Hauptbahnhof* erected in each of the two cities, and new suburban stations, round-houses, freight-depots, etc., provided. The design of these is frank and expressive, in some degree elegant, though not quite attaining the highest possible merit in their class of design.

An interesting and thus far successful experiment is a vast coöperative store-building, in which about sixty merchants unite to exhibit and sell their goods. The building, on the Friedrichstrasse, is of reënforced concrete, and covers 93,358 square feet, or nearly 2½ acres of ground. It is architecturally far more interesting internally than externally, and cost 8,500,000 marks exclusive of the cost of the land.

At Munich a number of important new university buildings have been completed, chiefly for the Medical Faculty; an Anatomical Museum, by Heilmann and Littmann; a building for Psychiatry, another for research laboratories, etc. Of houses, villas, apartments, and shops, the year's production calls for no special notice.

Data for AUSTRIA indicate about the usual activity, with no important forthcoming work. A new Exchange for Trade and Industry (Handels und Gewerbekammer) is among the year's buildings in Vienna.

In GREAT BRITAIN the most notable architectural event of the past year was the opening of the newly completed Victoria and Albert Museum in South Kensington (London) in April by the King. This immense edifice has been nearly four years in building, from the plans of Sir Aston Webb, and affords ample and much needed accommodation for the constantly growing artistic and industrial collections of that celebrated museum. The architecture of the new building is, however, a little disappointing, both internally and externally. It is in excellent taste, refined and generally pleasing, but it hardly possesses the grandeur and interest which one might suppose its imposing dimensions would have permitted its designer to impart to it. New buildings for Birmingham University, by the same architect, with Mr. Ingus Bell, have also been completed during the year, and these two are the most important enterprises completed during 1909. The National Library of Wales, recently com-

pleted at Cardiff, and an important competition for the Middlesborough Public Library, indicate continued though moderate activity in a department of design which has never had in Great Britain the opportunities afforded in the United States by the unexampled multiplication of libraries during the past few years. Another branch of design in which American architects have achieved a certain success at home is represented in London by the monumental building completed in 1909 from plans by R. F. Atkinson for "Selfridge's," the new American department store on Oxford Street. Among other buildings completed or nearly completed in 1909 in London the Royal Automobile Club stands conspicuous, not only by its size and cost, but also because of its somewhat severely classical design in a rather cold and formal style rarely seen in London in recent years. Elsewhere, among many other buildings perhaps but little less worthy of notice, may be mentioned the Manchester Royal Infirmary by Reginald Blomfield, a very extensive group of hospital buildings; in Edinburgh, the new building (or rather one-half of the design) for the Edinburgh College of Art, and the beginning of a memorial chapel of very considerable cost and elegance on the east side of the south transept of St. Giles Cathedral by H. T. Oliver. Work has been continued on a number of important structures begun in previous years, among the most notable of which are the great Liverpool Cathedral; the new extension of the British Museum, by Mr. W. Burnett; the Queen Victoria Memorial in London, by Mr. Brock; the Wesley Memorial building near Westminster Abbey, and various buildings along the Kingsway. The new building for the London County Council has been begun, but had hardly risen to view above ground at the close of the year. A number of new buildings are being erected, or have been recently finished, at Oxford and at Cambridge, from plans by T. G. Jackson, R. A., and there has been a normal activity in the building of churches, schools and houses, in the first and last of which categories the English architects have continued to do much admirable work, hardly equaled, if at all, in any other country. An important British work, though not erected in Great Britain itself, is the Queen Victoria Memorial Hall, the erection of which was begun in Calcutta (India) from plans by Sir William Emerson.

The year has been marked by an increasing interest in the problem of architectural education and the opening of new courses in architecture in various centres, as in the Edinburgh College of Art and in Liverpool University, where, among other steps in advance, there has been founded a chair of Civic Art and Town Planning, whose first incumbent is Professor C. H. Reilly. A very active controversy as to the establishment of a curriculum in architecture at Cambridge University ended in the failure, at least for the time being, of the proposed enterprise.

In the field of archaeological restoration interest has been chiefly centred on Winchester Cathedral, whose foundations in a wet and springy soil have begun to give way after having apparently sufficed for nearly or quite eight hundred years. The difficult task of underpinning these foundations, of restoring the walls and piers, if possible, to the vertical,

THE NEW MUNICIPAL BUILDING FOR NEW YORK CITY

McKIM, MEAD, AND WHITE, ARCHITECTS

The historic City Hall is shown in the foreground

and of providing against further collapse, is under the general direction of T. G. Jackson, R.A., assisted by competent engineering experts.

In ITALY the most notable architectural features of the year have been the substantial completion of the vast Palace of Justice in the Castelli quarter of Rome, across the Tiber; and the very active continuance of work on the colossal Victor Emmanuel monument at the head of the Corso in the same city. The Palace of Justice is over-ornate in design, but, apart from its details, well composed and solidly constructed. The Victor Emmanuel monument, the crowning work of the late Signor Beltrami, stands on the slope of the Capitoline Hill overlooking the Corso, and consists of a colossal colonnade with projecting terminal wings, standing on a lofty podium or basement, and framing a colossal equestrian statue of the great king and warrior whom it commemorates. It is richly adorned with symbolic and allegorical sculpture, the halls behind the colonnade are sumptuously lined with precious marbles, and the cost will run up probably to nearly or quite \$15,000,000. The lesser Palace of Venice (the Palazzo) is to be demolished, as it obstructs the view of part of the monument from the Corso; but this interesting fifteenth-century palace is to be later reerected, stone for stone, on another site.

At Milan a great church to be dedicated to the Sacred Heart is in process of erection; at Bergamo the municipal improvements (great square, arcade, tower, etc.) announced a year ago were being actively prosecuted under Signor Quaroni's direction; and at Venice the great Campanile of St. Mark was carried up to a height of some 230 feet before the close of the year.

In other countries many important buildings escape the writer's notice through failure to publish them until (if at all) a year or more after their completion. As observed in a previous issue, there is a very considerable architectural activity in South America, of which no information reaches North Americans except by rare illustrated articles in the magazines. To a less extent the same is true of Canada, which might well support a fine illustrated architectural monthly, in which to exhibit the large amount of excellent work being done in the Dominion by both Canadian and American architects.

Before turning to the architectural record of 1909 in the United States we may add to the foregoing survey the completion of the Royal Palace at Laeken (Belgium) from designs by Ch. Girault of Paris; the extension of the Royal Palace at Brussels, by the late M. Maquet: in the latter city the completion of the large banking building of the Société Générale de Belgique and the inauguration of extensive municipal improvements by the cutting of wide streets through congested districts, especially those between the Royal Palace and the Cathedral of Ste. Gudule; at Copenhagen a new Royal Palace or château by Jorgensen; in Constantinople, under a new and progressive régime, the year has witnessed the completion and opening of an imposing new Post-Office building, the beginning of a new Custom House, the extension of the Museum of Antiquities, and the transformation of the superb Palace of Chernagan on the Bosphorus into a Parliament Hall.

The enterprising East European capitals of Sofia (Bulgaria), Bucharest (Rumania), and Buda-Pesth (Hungary) were the scenes of a considerable building activity, but exact data are not available at this writing for compiling a precise record of it.

In the UNITED STATES, while the year's record was not extraordinary, it was one of very great and encouraging activity along all lines, showing complete recovery from the disastrous financial crisis of 1907. No feature of this activity is more noteworthy, and none as dramatically interesting, as that which marked the third year of San Francisco's phoenix-like revival from the flame and destruction of April, 1906. A very large proportion of the devastated city has been entirely reconstructed, and the year 1909 saw the completion of a great number of office buildings, churches and other edifices in a more substantial, fire-resisting construction than was to be seen before the earthquake and fire. It has been a remarkable exhibition of pluck, enterprise, and skill, with the one drawback that the opportunity was not improved for remodeling the street plan as proposed by Mr. Daniel H. Burnham.

In New York, the forthcoming architectural features of the year were the completion of the Metropolitan Life Insurance Company's tower-building, over 700 feet high, with 47 stories of offices, the highest inhabited building ever erected; the completion and closing in of the crossing or rotunda and choir of the Cathedral of St. John the Divine (Heins and Lafarge), so far as the main construction is concerned—the hemispherical dome on pendentives adding another element of incongruity and incoherence to this singular and heterogeneous edifice; the beginning of active work on the new municipal office building at the Brooklyn Bridge terminus (McKim, Mead and White); the advance towards completion of the Public Library Building (Carrère and Hastings) now receiving its interior finish; the rapid progress of work on the new Pennsylvania terminal at Thirty-first Street (McKim, Mead and White), which now begins to display its imposing dimensions and fine masses, a truly noble edifice; the completion and opening of the Queensboro' Bridge, a great cantilever bridge crossing from Manhattan to Queens over Blackwell's Island, with architectural features of decided interest designed by H. F. Hornbostel; the approach to completion of the Manhattan Bridge (Carrère and Hastings); the external completion of the striking group of Gothic buildings by Allen and Collens for the Union Theological Seminary; the completion of the vast Belvoir apartment house (by Hess and Weeks); and of the new Police Headquarters (Hoppin and Koen); the opening of new and imposing Masonic Halls in Manhattan (by H. P. Knowles) and in Brooklyn (Lord and Hewlett), and the completion and opening of the beautiful New Theatre on Central Park West (Carrère and Hastings).

In Boston the completion of the great and beautiful new Museum of Fine Arts, a classic structure some 500 feet long, designed by Guy Lowell, was the most notable architectural event. It is the finest and largest single building thus far erected for art museum purposes in America, and compares favorably with the finest examples in Europe. Two important competitions were held, one for the Boston

Roman Catholic College, for which the prize was won by Maginnis and Walsh; and for the Peter Brent Brigham Hospital, for which the prize was awarded to Codman and Despradelle. In Philadelphia the great new Wanamaker store was carried well on towards final completion—a dignified and elegant design; and there was built in the same city for the United States Marine Corps, from designs by Rankin, Kellogg and Crane, an Equipment Store House of unusually interesting architecture in its successful adaptation of classic motifs to construction in brick and to the expression of its utilitarian purpose. The building activity in Chicago was well up to former records, but not exceptional, and excepting the new University Club, the completion of the new Chicago and Northwestern terminal, and a number of banking and office buildings, has no specially prominent building to its credit for 1909. Other railway stations may here be mentioned as of the past year: a great Union Station at New Orleans (Daniel Burnham), the new D. L. & W. Station at Scranton, Pa., begun in 1908 (K. Murchison), and the interesting terminal of the Hudson River Tunnels in the subterranean portions and part of the ground story of the Terminal Building in New York.

In Washington the two great office buildings for the Senate and House, which have been for some years building (Carrère and Hastings), were finally completed. At Pittsburgh work was begun on the great group of buildings projected for the University of Pittsburgh (H. F. Hornbostel), and the First National Bank completed, a striking and expressive design by Daniel Burnham. At Baltimore the Provident Savings Bank, by York and Sawyer, added another to their long list of successful banking buildings. Other buildings and projects to be credited to 1909, among a vast number which there is no room to mention, are the New York State Normal College at Albany (Ross, Heins, Ware); permanent buildings for the New York State Fair at Syracuse (Green and Wicks); new buildings and a new and coherent plan of architectural development for Princeton University; a long list of buildings at the various universities and larger colleges throughout the Union; and last, but of greater architectural interest and importance than all the foregoing, the beautiful though temporary buildings of the recent Alaska-Yukon-Pacific Exhibition at Seattle, Wash., for the special display of the resources and products of Alaska and the Northwestern and Pacific States. Howard and Galloway were the architects of the whole general design and most of the important buildings, which were as a whole remarkably successful.

During the year the use of concrete was widely extended, especially in combination with hollow tile and stucco for relatively inexpensive rural residences, many of them being made fireproof throughout. The diminution in our national timber supply and the increased and growing cost of wood have brought about a situation in which such construction in tile and concrete is but little more costly, while far more safe and durable, than ordinary framed construction in wood. The development of new and interesting types of house architecture appeared to be going on as a consequence of this change of materials. See CONCRETE.

The year was marked by the death, on Sep-

tember 14, of the most noted of modern American architects, Mr. Charles Follen McKim, to whom more than to any other one person the progress of architecture and the improvement of public taste in matters especially of monumental and public architecture in the United States are due. A designer of great and noble buildings and founder of the American Academy at Rome, he was a constant force working for the adoption of higher ideals and loftier conceptions in his chosen art. Another notable figure has passed away in the death of M. Auguste Choisy, author of works on the history of architecture which stand very high in the world of architectural scholarship. During the past year Mr. Norman Shaw, one of the most distinguished of living English architects, has withdrawn formally from the practice of his profession.

ARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA. A South American republic lying between Chile and the southern Atlantic coast. The capital is Buenos Ayres.

AREA AND POPULATION. The republic consists of 14 provinces, 10 territories, and the federal district (city) of Buenos Ayres, having an aggregate area estimated at 1,138,352 square miles. The census of 1895 showed a population of 3,954,911; official estimate of 1907, 6,210,428; estimate at the end of 1908, 6,484,023, of whom about 1,800,000 were foreign-born and 2,400,000 the children of foreign-born parents. The provinces having the largest populations (estimated) were Buenos Ayres, 1,647,029; Santa Fé, 816,401; Córdoba, 546,844; Entre Ríos, 406,867; Corrientes, 319,386; Tucumán, 293,211; and Mendoza, 216,196. The most densely inhabited portions are the federal district and the provinces of Tucumán, Entre Ríos, Santa Fé, and Buenos Ayres. The population of Buenos Ayres, next to Paris the largest Latin city, was estimated at 1,203,050 on May 30, 1909. The growth of this city, not only in population but in improvements of all kinds, has been extraordinary. It possesses one of the finest systems of docks and wharves in the world and has projected an extensive system of underground railways. Other important cities, with population according to latest available statistics, are: Rosario (1906), 150,686; La Plata, 80,000; Tucumán (1909), 66,917; Córdoba, 53,000; Bahía Blanca, 37,755; Mendoza, 35,314; Paraná, 27,000. In 1908 the over-sea immigration was 255,710, as against 209,103 in 1907; in addition there were 47,402 arrivals from Montevideo, making a total of 303,112, as compared with 257,924 in 1907. The emigrants in 1907 numbered 90,190; in 1908, 127,032. Of the immigrants in 1908, 116,069 received free transport to the interior and were located in small groups at 1010 different places. In 1908 the over-sea immigrants included 107,357 Spaniards, 78,947 Italians, and 6780 Russians; only 326 came from North America.

The total number of immigrants who arrived in Argentina from 1857 to 1908 inclusive was 3,178,456, of whom nearly 1,800,000 were Italians. Immigrants arriving in 1901-08 numbered 1,243,379.

EDUCATION. Primary instruction is free, secular, and nominally compulsory, but about one-half of the inhabitants over six years of age are illiterate. In 1906 the primary schools numbered 5941, with 557,657 registered pupils.

THE NEW BUILDINGS OF UNION THEOLOGICAL SEMINARY, NEW YORK CITY, IN COURSE OF ERECTION—THE LIBRARY
LOUIS E. JALLADE, ARCHITECT

Secondary education is controlled by the Federal government. There are about 20 lycées and 45 normal schools. On May 24, 1909, a new industrial school, erected at a cost of \$424,000, was opened at Buenos Ayres. For higher education there are national universities at Buenos Ayres and Córdoba, provincial universities at Santa Fé, La Plata, and Paraná, a school of mines, a college of agriculture, a school of commerce, a military and a naval school, etc. In addition to the public educational institutions, there are numerous private schools throughout the country. Newspapers are published in even the smaller towns, and in Buenos Ayres 472 periodicals of all kinds are reported, of which 66 are dailies, 16 tri-weeklies, 44 bi-weeklies, 191 weeklies, and 64 monthlies. The state religion is Roman Catholicism, but religious toleration prevails.

AGRICULTURE, STOCK RAISING, ETC. To her farms and live-stock Argentina owes her constantly increasing prosperity. For the agricultural year 1908-9, the total cultivated area was reported at 15,830,563 hectares (1 hectare = 2.471 acres), the areas sown to the principal crops being as follows: Wheat, 6,063,100 hectares; corn, 2,973,900; flax, 1,534,300; oats, 633,300. About 4,000,000 hectares are under alfalfa, and 56,000 hectares are planted to vineyards. The cultivated area in 1908-9 showed about a 10 per cent. increase over that of the preceding year. Of the areas sown to wheat, corn and flax, the province of Buenos Ayres was credited with 40, 49, and 28 per cent., respectively. Santa Fé had 23 per cent. of the wheat area, 28 of the corn, and 44 of the flax; Córdoba, 25 per cent. of the wheat, 9 per cent. of the corn, and 11 per cent. of the flax; Entre Ríos, 5 per cent. of the wheat, 4 of the corn, and 15 of the flax. Of the 633,300 hectares sown to oats, 579,700 hectares were in the province of Buenos Ayres. The estimated yields of the staple crops in the 1908-9 season were: Wheat, 5,759,185 tons; corn, 5,930,000 tons; flaxseed, 1,457,585 tons; and oats, 791,625 tons. In 1907 the production of sugar chiefly in the province of Tucumán amounted to 109,445 tons; in 1908, 161,662 tons. Wine production in 1907 amounted to 169,722,391 litres, and in 1908, 186,091,072 litres; of the latter amount 174,297,392 litres were produced in the province of Mendoza. Cotton and silk culture have begun to be of some importance, and the cultivation of yerba mate is now being fostered by the government. In 1909 a plan was projected for a system of irrigation, costing upwards of \$24,000,000, to effect a more advantageous distribution of the waters of the Negro, Limay, Tercero, Mendoza, Neuquén, Tumayán, Saldo, Diamante, Atuel, and Dulce rivers.

The third general census of live-stock in the Republic was taken in May, 1908, the two previous enumerations having been made in 1888 and 1895. The returns of the third census showed an increase over 1895 in the number of each kind of live-stock except sheep. The figures for 1895 and 1908 respectively are: Cattle, 21,701,526 and 29,116,625; horses, 4,446,859 and 7,531,376; sheep, 74,379,562 and 67,211,754; swine, 652,766 and 1,403,591; goats, 2,748,860 and 3,945,086; mules, 285,497 and 465,037; asses, 197,872 and 285,088. The total value of the live-stock was placed at about \$645,000,000. Of cattle, horses and sheep

respectively, the provinces of Buenos Ayres had 16,351,235, 2,519,953, and 34,604,972; Corrientes, 4,275,895, 596,130, and 3,138,563; Santa Fé, 3,413,446, 913,965, and 969,406; Entre Ríos, 3,145,639, 647,107, and 7,005,469; Córdoba, 2,639,480, 907,514, and 1,992,110. It is seen that by far the greater part of the live-stock are in the eastern provinces, all but one of which border on the River Plata; together they had in 1908 21,191,076 cattle, 4,719,712 horses, and 45,718,410 sheep. It was in these provinces, however, that occurred the great decline in the number of sheep—16,523,176 less than in 1895—a decline due partly to the substitution of cattle for sheep on the pastures and partly to the remarkable development of cereal production in this part of the Republic. The decline in sheep was partly offset by a net increase in the territories of about 9,000,000. The Argentine government in various ways encourages and protects the live-stock industry. Animal expositions held at Palermo, near Buenos Ayres, show a constant improvement in breeding and selection of stock, and rigid quarantine regulations are in force regarding the importation of animals.

Argentina's meat-packing industry has assumed extraordinary importance. Returns for 1908, perhaps not complete, showed for the freezing and salting establishments a slaughter of 981,965 cattle, 3,827,846 sheep, and 14,611 swine. In addition these establishments slaughtered 754,300 Uruguayan and 425,000 Brazilian cattle.

Compared with the meat packing, the dairy industry, which centres in the province of Buenos Ayres, is small. Returns from 579 establishments showed, for 1907, a milk production of 206,822,196 litres and a butter production of 6,727,988 kilos. Cheese produced in 1907 amounted to about 1,870,802 kilos.

In 1895 there were 82,497 ostriches in Argentina; in 1908, 422,783. There is a constantly growing demand for plumes in the country, so that, notwithstanding the increasing flocks, exports have been declined.

The northern provinces are rich in timber, and the quebracho industry especially has become important. (See FORESTRY.) Mineral production is retarded by the present lack of capital, difficulties of transportation, and the high price of fuel. Small quantities of salt, copper, and gold are mined.

MANUFACTURES. Manufacturing, which is hampered by the lack of fuel, does not show a great development. In 1907 there were 350 flour mills, of which 290 were in operation, grinding 1,021,252 metric tons of wheat, yielding 697,863 tons of flour, 175,339 tons of bran, 93,030 tons of middlings, and 18,964 tons of seconds. Of the amount ground about 59 per cent. was produced in the city and province of Buenos Ayres. There are two cotton spinning mills and 66 weaving establishments. Tobacco factories number 77, representing an investment of \$3,440,272 and an annual output valued at about \$12,783,000. The greater part of the manufacturing is in Buenos Ayres city and province. At the beginning of 1909 there were within this area 8647 factories, of which about three-fourths were owned by foreigners. The total capital amounted to \$59,090,235, and the gross annual income to \$123,178,000. The four leading industries were: Frozen-meat companies (8), capital, \$13,220,758; breweries (11),

capital, \$7,196,970; flour mills (67), capital \$4,822,293; paper factories (6), capital, \$2,755,229. The employees in all the factories numbered 46,642.

FOREIGN COMMERCE. Imports and exports, exclusive of coin and bullion, have been as follows, in gold pesos (1 peso = \$0.965) :

	1906	1907	1908
Imports	269,970,524	285,860,683	272,972,736
Exports	292,253,829	296,204,369	366,005,341

The leading imports in 1908 were, in gold pesos: Textiles and their manufactures, 49,911,338; transport appliances, vehicles, etc., 30,700,337; iron and its manufactures, 30,075,484; ceramic products, 24,897,435; foodstuffs, 23,549,097; building materials, 21,182,426; agricultural implements, 15,839,838; wines and liquors, 13,279,781; oils (mineral, vegetable, etc.), 11,051,723; chemical and pharmaceutical products, 9,189,153; metals (other than iron) and their manufactures, 8,749,866; woods and their manufactures, 6,212,864; paper and its manufactures, 5,942,560; tobacco and its manufactures, 5,557,649; electrical appliances, 3,329,290; leather and its manufactures, 2,136,303; live animals, 1,768,730.

Exports in 1908 were included in six general classes: Agricultural products, 241,877,164 pesos (gold); live-stock products, 115,118,457; forest products, 6,347,234; mineral products, 810,961; fish and game, 498,612; various, 1,552,913. As compared with the preceding year the export of agricultural products increased by 77,585,543 pesos, forest products by 1,004,877 pesos, and mineral products by 245,922 pesos, while the exports of live-stock declined by 8,701,748 pesos and fish and game by 330,947 pesos. The export of wheat in 1908 amounted to 3,636,294 tons, valued at 128,842,610 pesos, an increase of 955,492 tons and 46,114,863 pesos over 1907; corn, 1,711,804 tons, valued at 35,614,594 pesos, an increase of 455,492 tons and 11,902,886 pesos; linseed, 1,055,650 tons, valued at 49,004,704 pesos, a gain of 291,914 tons and 12,923,483 pesos; flour, 113,500 tons, showing a decrease of 13,999 tons, but an increase in value of 436,400 pesos; oats, 440,041 tons, valued at 9,697,397 pesos, a gain of 296,475 tons and 6,104,000 pesos. Among pastoral products the exports of 1908 included: Frozen and chilled beef, 174,563 tons, showing an increased valuation over 1907 of 5,275,000 pesos; wool, 175,538 tons, valued at 47,246,183 pesos, a decrease of 12,016,765 pesos; sheepskins, 27,957 tons, a decrease of 2,600,000 pesos; frozen mutton, 78,848 tons, cattle hides, 64,516 tons, a decrease of 900,000 pesos; fats and grease, 43,977 tons; bones, 26,099 tons; hair, 2193 tons; goatskins, 2309 tons.

In 1908 the live-stock exports were: Beef cattle, 60,916; sheep, 103,792; horses, 5082; asses, 11,163 (11,162 to Bolivia); mules, 7967; swine, 126. Counting the live-stock slaughtered in the freezing establishments and salting works, the total number of beeves exported in 1908 was 882,362, and of sheep 3,401,459, as compared with 918,873 beeves and 2,912,581 sheep in 1907.

In 1907 the quebracho export amounted to 246,514 tons of round timber and 28,195 tons of extract; in 1908, 254,571 tons of round timber and 48,161 tons of extract.

The trade in 1908 with the principal countries of origin and destination is shown in the following table, in gold pesos:

	Imports from	Exports to
Great Britain.....	93,371,396	78,324,723
Germany	67,847,076	34,751,994
United States.....	35,597,004	13,023,238
France	26,476,917	28,913,730
Italy	24,913,248	7,907,857
Belgium	12,753,373	35,778,188
Spain	8,618,110	2,599,603
Brazil	7,285,946	15,095,578
Austria-Hungary	3,293,500	1,071,134
Uruguay	2,207,038	774,454
Netherlands	2,038,030	5,299,670
Paraguay	1,509,955	213,666

SHIPPING, ETC. Buenos Ayres is the port at which the most vessels enter and clear, while Rosario is second and La Plata and Bahia Blanca have considerable foreign trade. Steamship service is principally between Buenos Ayres and European ports, but five steamship lines (1908) connect directly with the United States, only one of which, however, has regular passenger service. In 1908 the port of Buenos Ayres was visited by 2003 steamships, aggregating 4,646,404 tons, and by 229 sailing vessels, aggregating 242,337 tons, an increase of 359 steamships and 998,978 tons over 1907, and a decrease of 9 sailing vessels and 10,931 tons. The tonnage was divided as follows: British, 2,846,014 tons; German, 599,536; Italian, 483,780; French, 330,044; other countries, 629,367. Shipping to Buenos Ayres under the American flag was represented by only four small sailing vessels, aggregating 4074 tons.

It was announced in 1909 that during the following ten years some 60,000,000 pesos (gold) would be expended in improving the port of Buenos Ayres and on the construction of a ship canal which will enable vessels of deep draft to ply between the capital and Rosario at all stages of the tide.

INTERNAL COMMUNICATIONS. At the end of 1908 there were 14,740.5 miles (23,722.6 kilometres) of railway representing a capitalization of 788,964,416 pesos (gold) in operation. In the summer of 1909, 15,476 miles were reported. The total earnings in 1908 were 101,391,000 pesos, and the net profits 40,023,000 pesos; passengers numbered 48,593,800, and the freight amounted to 31,930,600 tons. Lines owned and operated by the government aggregated 1838 miles. In 1909 about 4000 miles of railway were under construction, and 6200 miles under survey. The Transandine railway is still under construction; it will be 888 miles long, connecting Buenos Ayres with Valparaiso (Chile), and includes the Andine tunnel, which when completed will have a length of 9941 feet. It is expected that the line will be open to traffic before the middle of 1911. At the end of 1908, the telegraph system comprised 15,772 miles of line, with 38,461 miles of wire, over which during the year 10,840,000 messages were transmitted; 9457 persons were employed, and the receipts amounted to 2,476,140 pesos. On the same date the post-offices numbered 2377, an increase of 239 during 1908; the postal receipts for the year amounted to 8,328,989 pesos.

FINANCE. In 1907 the revenue amounted to 64,527,983 pesos gold and 97,153,870 pesos paper (the gold peso is worth 96.5 cents, and the paper peso, under the conversion law of

1899, .44 of the gold peso). For 1908 the estimated revenue was 57,830,105 pesos gold and 83,766,359 pesos paper; estimated expenditure, 24,450,259 pesos gold and 155,931,230 pesos paper. The budget for 1909 showed estimated revenue of 62,520,433 pesos gold and 89,979,319 pesos paper; and estimated expenditure, 25,463,321 pesos gold and 173,969,224 pesos paper.

The principal estimates of revenue were: Import duties, 55,030,000 pesos gold; spirits and beer, 19,800,000 pesos paper; tobacco, 17,400,000 paper; port dues, etc., 5,230,000 gold; ports and telegraphs, 9,700,000 paper; stamps, 9,450,000 paper; railways, 9,000,000 paper. The principal estimates of expenditure were: Public debt, 23,045,692 pesos gold and 16,605,488 pesos paper; justice and education, 31,515,746 paper; interior, 27,150,650 paper; public works, 26,370,340 paper; army, 21,810,614 paper; navy, 13,488 gold and 16,300,938 paper. On December 31, 1908, the total liabilities of the government amounted to about 378,500,000 pesos gold. On the same date the government gold reserve for the conversion of national currency was 126,482,516 pesos gold, an increase of 21,368,644 pesos over 1907. Argentine banks had on deposit 20,474,471 pesos gold and 809,323,321 pesos paper, as compared with 29,028,792 gold and 729,328,111 paper in 1907.

Large amounts of foreign capital are invested in Argentina; in the lead is British capital, the estimated investments amounting in 1909 as follows: Government and municipal bonds, £74,384,153; railways, £153,191,058; miscellaneous, £25,125,809; total, £252,701,560.

ARMY. By the provisions of the law of 1905 compulsory service in the army is required of all citizens from their twentieth to forty-fifth year, divided into three periods as follows: 10 years in the active army, 10 years in the national guard, and five years in the territorial guard. This is not rigorously enforced, however, so that actually the army consists of a national militia where a period of continuous training in the ranks is demanded only for one year, and that only of a portion of the soldiers annually summoned, the remainder being released after three months' training. Provision is made for maintaining the organization and training, however, throughout the statutory periods. On a peace footing the Argentine army consisted of 18 battalions of infantry, two of which were mounted, 10 regiments of cavalry, 5 regiments of field artillery, three regiments of mountain artillery, and four battalions of engineers. The total force aggregated between 16,000 and 17,000 men. On a war basis the five military districts into which the Republic is divided will each furnish a complete division and a reserve division each of about 12,000 men irrespective of the national guard and territorial troops which receive but little training. The Mauser repeating rifle, model 1891, is used by the infantry and a carbine of the same system by the cavalry.

NAVY. In 1909 the Argentine navy was reported to comprise 4 armored cruisers of the first class, of 6840 tons each; 3 ironclads, of 4200 tons; 2 monitors, of 1535 tons; 4 cruisers of the second class, of 4700, 3500, 3200, and 1530 tons respectively; and 3 destroyers, 2 torpedo cruisers, 24 torpedo boats, 5 transports, 1 school-ship, and a number of auxiliary vessels. The officers (including engineers) number 493,

and the number of enlisted men varies from 5000 to 6000, according to the number of annual recruits. The government negotiated in 1909 for two new battleships with a shipbuilding company in the United States. The two vessels were to be superior to the ships of the Brazilian *Minas Geraes* class in size, speed, and armament. It was expected that they would be similar to the American *Arkansas* class, with a tonnage of about 25,000, turbine engines and a speed of 22 knots on 8-hour trial.

GOVERNMENT. Argentina is one of the five American republics that have adopted the federal form of government, the others being the United States, Mexico, Brazil, and Venezuela. The executive authority is vested in a president, who is elected for a term of six years and appoints a responsible ministry. The President in 1909 was José Figueroa Alcorta, formerly Vice-President, who assumed office on the death of President Quintana in March, 1906. The legislative power devolves upon a congress of two houses, the Senate (30 members) and the House of Deputies (120 members). Except in matters affecting the Republic as a whole, the provinces are autonomous, having their own elected legislatures and governors.

HISTORY. It was announced in February that the new internal loan of \$50,000,000 in gold at five per cent. had been secured by a group of American and European financiers, including J. P. Morgan. Serious disturbances occurred during the first week of May in consequence of anarchist agitation and labor troubles. A collision on May Day between the labor demonstrators and the police resulted, according to the report, in twelve killed and one hundred injured. The raid was said to have been begun by anarchists who fired on the police wounding five. In the fight between the strikers and the strike-breakers on May 3 one was killed and several were wounded. The strikers declared they would not return to work until the prefect of police resigned. The strike entailed great hardship on the public. The necessities of life were hard to obtain; the port was practically closed and the tram cars were held up. On May 7 a score of persons were injured by a bomb explosion on a street car. The President's message to Congress was read on May 15. It promised a treaty of arbitration with the United States, declared the economic situation good and announced a surplus in the budget of 1908 of \$40,000,000 in paper over the estimates. Much distress was caused by a drought which extended over a great part of the country in May. The course of Bolivia (q. v.) in the matter of the Peruvian award in the boundary dispute between Bolivia and Argentina caused much indignation in the latter country. The Bolivian government announced that the award would have to be ratified by the Congress. Argentina complained of this as a violation of the treaty of 1902 which gave the arbitrator the final decision with appeal. Further offense was given by the terms of a circular addressed by the Bolivian government to the prefects of departments, saying that the award was unjust and must be regarded as a national misfortune. As a result of these difficulties Argentina severed her diplomatic relations with Bolivia. The prefect of police was killed by a bomb thrown by an anarchist in Buenos Ayres November 14. The President signed a decree proclaiming martial law for sixty days.

ARIZONA. A Territory of the Southwestern United States. It has an area of 113,956 square miles, of which only 116 square miles are water. There was a population in 1900 of 122,931. According to a Federal estimate made in 1909 the population was 154,151. The capital is Phoenix.

MINERAL PRODUCTION. Copper is the chief mineral product of the mines of Arizona, although copper, gold, silver and lead are also produced in considerable quantities. The total value of the mineral products of the State in 1908, according to the figures given by the United States Geological Survey, was \$43,502,834. This was a considerable decrease over the value of the product of 1907, which was \$56,753,650. In the mining of copper Arizona ranks third among the States, being surpassed only by Montana and Michigan. In 1908, 289,523,267 pounds of a value of \$3,821,707 were produced. This was a considerable increase over the product of 1907 which was 256,778,437. The lower price of copper, however, made the value of the 1908 product much less than in 1907, when it was \$51,355,687. The production of copper has shown a remarkable increase since 1900 when it amounted to less than 200,000 pounds. About one-half of the product comes from Cochise county. The copper output equals about one-fourth the total product of the United States. There were produced in 1908, 120,937 fine ounces of gold, valued at \$2,500,000 as compared with 128,871 fine ounces in 1907, with a value of \$2,664,000. The silver production of 1908 was 2,900,000 fine ounces, valued at \$1,551,200 as compared with 2,903,100 fine ounces in 1907 with a value of \$1,916,000. Lead was produced to the amount of 1464 short tons, valued at \$122,976, compared with 2340 short tons, valued at \$248,040 in 1907. There are also clay products, precious stones, tungsten, and a small quantity of zinc produced in the State. The value of the mineral products of the State for the year 1908 was \$43,502,834 as compared with a value of the product for 1907 of \$56,753,650.

The gold production in 1909 was estimated by the Director of the Mint at 1,292,736 fine ounces, valued at \$3,672,300. The silver production was 3,632,200 fine ounces, valued at \$1,889,300.

The production of copper in 1909 showed a slight increase over the production of 1908. As a result of the increase in Montana, the State fell to second place in the production of this metal.

AGRICULTURE AND STOCK RAISING. The acreage, value and production of the principal crops in the Territory in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 417,000 bushels, valued at \$417,000; from 13,000 acres; spring wheat, 400,000 bushels, valued at \$556,000, from 16,000 acres; oats, 148,000 bushels, valued at \$117,000, from 4000 acres; barley, 1,280,000 bushels, valued at \$1,126,000, from 32,000 acres; hay, 360,000 tons, valued at \$4,608,000, from 109,000 acres. The area of the agricultural lands in the Territory is about 1,500,000 acres, but the area actually under cultivation is little in excess of 200,000 acres. Cultivation is carried on largely by irrigation. Fruits of all kinds, both temperate zone and sub-tropical, are grown on a small scale. The farm animals on Jan. 1, 1910, were as follows: Horses, 115,000; other cattle 626,000; sheep, 1,020,000. The numbers of cattle and sheep have increased considerably

in the last few years, the increase of sheep being nearly 50 per cent. in the last three years. The wool clipped in 1909 was 5,361,200 pounds.

Sugar beets have been grown with some success. A large factory has been erected at Glendale, and 4000 acres of beets were planted. The crop from this was very successful. Dry farming is carried on with success in different parts of the Territory. The ostrich industry is important. In the Salt River Valley there are more than 5000 ostriches, which constitute over 80 per cent. of all the ostriches in the United States.

EDUCATION. The number of school children between the ages of 6 and 21 in the school year 1908-9 was 36,729. Of these there were enrolled in the public schools 27,639. The average daily attendance was 17,863. There were employed in the schools of the Territory 122 male teachers and 671 female teachers. The average monthly salary of male teachers was \$104.64 and of female teachers, \$79.61. The total receipts for education during the year amounted to \$926,587, and the total expenditures were \$889,148. The Territory maintains two normal schools, one at Tempe and the other at Flagstaff. At the former there were in 1909 251 students and at the latter 98.

FINANCE. There was a balance in the treasury on June 30, 1908, of \$436,324. The receipts for the fiscal year 1909 were \$915,490, while the expenditures were \$989,370, leaving a balance on June 30, 1909, of \$376,704. Unusually large appropriations by the 24th legislature increased the expenditures beyond those of previous years. The funded debt of the Territory on June 30, 1909, amounted to \$781,972.

CHARITIES AND CORRECTIONS. The correctional and charitable institutions of the Territory include the Territorial prison at Florence, Asylum for the Insane, and Territorial Industrial School at Benson. On June 30, 1909, there were in the Territorial prison 230 prisoners. In the Asylum for the Insane on June 30, 1909, there were 325 inmates. During the year a modern and well equipped hospital was almost completed and many other improvements were carried on. At the close of the year there were 54 boys and 4 girls at the Territorial Industrial School, which is a reformatory institution for incorrigible youths of both sexes.

POLITICS AND GOVERNMENT. The chief political interest in the Territory during the year was centred in the attempt to pass a bill in Congress providing for Statehood, and the failure of the measure. (See CONGRESS and NEW MEXICO.) The people of the Territory are a unit in their desire for Statehood and confidently expect to receive it at the present session of the 61st Congress.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A direct primary law was enacted; a railway commission for the Territory was created; an act was passed relating to vital statistics; the office of historian for the Territory was created; a home for aged and infirm Arizona pioneers was authorized; and a commission was appointed to draft a code of laws regulating mining. Measures were enacted requiring banks other than savings banks to keep at least 15 per cent. in cash with an aggregate amount of deposits. To the qualification of electors as heretofore was added the following: "And who, not being prevented by

physical disabilities from so doing, is able to read the Constitution of the United States in the English language in such a manner as to show he is neither prompted nor reciting from memory, and to write his name." Any person of good moral character who can pass the examination is authorized to practice law in the Territory. A statute limiting damages for injuries resulting in death for \$5000, was amended by striking out the amount and allowing the jury to fix damages.

OFFICERS: Governor, Richard E. Sloan; Secretary, George U. Young; Treasurer, E. E. Kirkland; Auditor, W. C. Foster; Adjutant-General, L. W. Coggins; Attorney-General, John B. Wright; Superintendent of Education, Kirke T. Moore; Commissioner of Insurance, George U. Young—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Edward Kent.; Associate Justices, E. M. Lewis, Fletcher M. Doan, John H. Campbell, Edward M. Doe; Clerk, F. A. Frith, Jr.—all Republicans.

The Territorial Legislature of 1909 was composed of 10 Democrats and 2 Republicans in the Council and 17 Democrats and 7 Republicans in the House. The Territorial Representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

ARKANSAS. One of the South Central Division of the United States. The area is 53,335 square miles, of which 810 are water. The population in 1900 was 311,564. The population in 1909, according to a Federal estimate made in that year, was 1,476,582. The capital is Little Rock.

MINEAL PRODUCTION. The most important mineral production of Arkansas is coal. Of this there were produced in 1908 2,078,357 short tons, with a value of \$3,499,470. The State suffered more from the unfavorable conditions which prevailed during 1908 than any other of the States of the Southwestern region. The loss in actual tonnage from the production of 1907 amounted to 592,081 short tons, while the value declined from \$4,473,693 in 1907. The factors which contributed to the decreased production were financial depression, the exceptionally warm weather during the winter months, labor disaffections, and increased production and consumption of petroleum and natural gas in the Louisiana and mid-continent fields. The last factor was chiefly responsible for the decrease. The labor disaffection was the usual biennial suspension of operations on April 1, pending the settlement of the wage scale. There were 5337 men employed in the mines of the State during the year, and of these, 4037 were on strike and idle for an average of 96 days each. Notwithstanding the depression and the decreased production in 1908 there was a larger number of men employed than in 1907. There were killed in the State in 1908, 14 men, while 17 were seriously injured. Among other important mineral productions are bauxite and clay products, the value of which in 1908 was \$508,788 as compared with 536,286 in 1907. Iron is also produced in considerable quantities, as well as lime and limestone. The values of the mineral products of the State for 1908 was \$5,348,907 as compared with a value of the products in 1907 of \$6,386,747.

The production of coal in 1909 was about the same as in 1908.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the chief crops, except cotton, in this State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 50,400,000 bushels from 2,800,000 acres, valued at \$36,288,000; winter wheat, 1,721,000 bushels, from 151,000 acres, valued at \$1,893,000; oats, 3,739,000 bushels, from 164,000 acres, valued at \$2,206,000; rice, 1,120,000 bushels, from 28,000 acres, valued at \$1,008,000; potatoes, 2,310,000 bushels, from 33,000 acres, valued at \$2,125,000; hay, 248,000 tons, from 198,000 acres, valued at \$2,678,000. The acreage of corn in the State has almost doubled in seven years. The crop of 1909 was, however, considerably smaller than that of 1908, which was 54,035,000 bushels. The cotton crop of 1909-10 was estimated at 715,000 bales as compared with 1,009,000 bales in 1908-9. A considerable area in the southwestern part of the State is devoted to the cultivation of rice. The crop of 1909 was over twice that of 1908, which was 467,400 bushels, and the area devoted to rice also increased from 11,400 acres to 28,000 acres in 1909. The number of farm animals in the State on January 1, 1910, was reported as follows: Horses, 290,000; mules, 215,000; milch cows, 361,000; other cattle, 800,000; sheep, 233,000; swine, 978,000. The number of horses and cattle have remained constant for several years, while other cattle have increased considerably. Swine have decreased during the same period. The wool clipped in 1909 was 766,080 pounds.

EDUCATION. The school population of the State at the beginning of the school year 1909 was 557,468. The enrollment in the public schools was 374,154, and the average daily attendance 243,232. The number of teachers employed was 9164. The average monthly salary for teachers was \$55.77. The total expenditures for public schools for the year ending June 30, 1909, was \$3,110,164. The first compulsory attendance law enacted in Arkansas became effective at the beginning of the school year 1909-10. Two acts were passed by the last General Assembly. One requires a minimum attendance of one-half a school term between the ages of 8 and 16 years, and is effective in 31 counties. The other places the age limit at from 8 to 14 years, effective in nine counties. This leaves 35 counties without compulsory law. A marked increase in the attendance in both town and rural schools is reported from all sections where these new laws apply. The last General Assembly appropriated \$160,000 for the establishment of four agricultural schools in the State, one in each of the four districts. In June, 1909, B. W. Torreyson was appointed Professor of Secondary Education in Arkansas. Excellent results are already apparent in correlating courses in village and city high schools and adding to the course of study in many schools. Consolidation of school districts was made possible by enactment of the last General Assembly, which permits the patrons of any rural territory to petition the County Court for the organization of a special school district having all the rights and privileges previously allowed only to schools in incorporated towns and cities. The annual convention of the Conference for Education in the South will be held at Little Rock, April 6, 7, and 8, 1910.

FINANCE. The report of the State Treasurer for the year 1907-8 showed a balance on hand on October 1, 1906, of \$3,236,686. The receipts from October 1, 1906, to September 30, 1908, were \$4,936,658. The disbursements from October 1, 1906, to September 30, 1908, were \$5,076,556, leaving a balance in the treasury on October 1, 1908, of \$3,096,788. The general revenue funds amounted on October 1, 1908, to \$281,147. The total expenditures under this fund from 1906 to 1908 were \$1,761,410. The receipts under the common school fund from October 1, 1906, to October 1, 1908, were \$1,812,281 and the expenditures \$1,709,758. The total State debt October 1, 1908, was \$1,250,500.

CHARITIES AND CORRECTIONS. The State charitable institutions are the Arkansas Hospital for Nervous Diseases, the Arkansas School for the Blind, the Arkansas Deaf and Dumb Institute, the Arkansas State Penitentiary, the Arkansas Federal Soldiers' Home and the Arkansas Reform School, all of Little Rock.

POLITICS AND GOVERNMENT. The Legislature re-elected United States Senator James P. Clarke for a second term, he having been the unopposed nominee of the Democratic primary. The Republican nominee, Harry H. Myers, received the votes of the three Republican members of the legislature.

The House passed three Prohibition measures. The first, the Gann bill, providing for statutory State-wide Prohibition, was amended in the Senate so as to provide for submission first to the voters of the State. The House refused to concur in the amendment. Another statutory State-wide Prohibition bill and a joint resolution providing for submission of the question were passed later by the House, but the Senate failed to pass either measure. A bill appropriating \$795,000 for the completion of the new State Capitol, the Governor's bill, was passed. The legislature annulled the contract between the State and Caldwell and Drake, former State Capitol contractors. A bill was passed creating a State Tax Commission, which has caused to be put on the tax books some fifty million dollars of new assessments. The legislature voted to submit to the people at the next State election—in September, 1910—two constitutional amendments, one providing for the initiative and referendum, and the other exempting from taxation, for a period of seven years, all capital invested in the manufacture of cotton in Arkansas for the next ten years. Bills were passed appropriating \$160,000 for four agricultural schools; \$250,000 for a new Insane Asylum annex; \$60,000 for a tuberculosis sanatorium. Other bills were passed providing for legalized primary elections and authorizing the working of State convicts on public roads. A general drainage law was also enacted. The legislature appropriated \$50,000 to enable the State to employ counsel and defend, in the United States courts, the suits brought by the railroads of the State in their effort to put in force higher freight and passenger rates.

OTHER EVENTS. On March 9 a tornado killed about thirty persons and injured three hundred in the town of Brinkley, besides doing damage to the amount of a million dollars. Other tornadoes in eastern and northwestern Arkansas killed small numbers of people.

The most important industrial development

during the year was the great growth of the rice industry in the eastern part of the State.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: An act was passed providing that two or more persons uniting for the purpose of doing an unlawful act while armed or disguised, and persons who knowingly attend a meeting for such purpose, shall be guilty of felony and shall be punished by confinement in the penitentiary not to exceed ten years. Such persons intimidating or attempting to intimidate any person by assault or destruction of property, or mailing or delivering any printed notice calculated to intimidate a person, shall be guilty of felony and punishable by confinement in the penitentiary from two to ten years, and fined not more than \$5000. Any such person who seeks to intimidate by writing or token, or deliver any message purporting to come from such unlawful band, shall be guilty of a felony and punishable by confinement in the penitentiary from one to seven years. This act was intended to prevent what is called night-riding. An act was passed providing that when mob violence is threatened the sheriff shall notify the judge of the trial court and request a special term of court. The judge may impanel a special grand jury and provide other necessary machinery and begin the trial within ten days.

OFFICERS. Governor, George W. Donaghey; Lieutenant-Governor, J. T. Robertson; Secretary of State, O. C. Ludwig; Treasurer, James L. Yates; Auditor, J. R. Jobe; Attorney-General, Hal L. Norwood; Superintendent of Education, George B. Cook; Commissioner of Agriculture, Guy B. Tucker; Commissioner of Public Lands, L. L. Coffman—all Democrats.

JUDICIARY: Supreme Court, Chief Justice, Edgar A. McCulloch; Justices, Samuel Fraenthal, C. D. Wood, Burrell B. Battle, and Jesse C. Hart; Clerk of the Court, P. D. English—all Democrats.

The State Legislature of 1909 was composed of 35 Democrats in the Senate, and 97 Democrats and 3 Republicans in the House. The State Representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

ARMIES. See MILITARY PROGRESS, and articles on countries.

ARMSTRONG, FRANK C. An American soldier and public official, died September 8, 1909. He was born at the Choctaw Agency, Indian Territory, in 1835, and was educated at Holy Cross College. In 1854 he accompanied General P. F. Smith in a journey across Texas, and for bravery in an encounter with Indians was appointed first lieutenant in the Second United States Dragoons. He served until 1861, when he resigned to enter the Confederate army. He performed notable services during the Civil War, and rose to the rank of brigadier-general. Following the war he was engaged in the Overland Mail Service. From 1885 to 1889 he was a United States Indian inspector, and from 1893 to 1895 was Assistant Commissioner of Indian Affairs.

ARNOLD-FORSTER, HUGH OAKELEY. An English statesman and publicist, died March 12, 1909. He was born in 1855. His father was William Delafield Arnold, son of Dr. Thomas Arnold, and brother of Matthew Arnold. William Arnold's four children, on his

death, were adopted by his sister and her husband, William Edward Forster, whence the double name Arnold-Forster. Hugh Arnold-Forster was educated at Rugby and University College, Oxford, and following his graduation studied for and was admitted to the bar. After some years of practice he left the law, and entered the publishing house of Messrs. Cassell. For them he wrote the *Citizen Reader*, and edited André's *Atlas*. In 1896 Arnold-Forster was elected to Parliament from West Belfast as a Liberal Unionist, and in 1900 he was made Parliamentary Secretary to the Admiralty. Following the South African War he went to South Africa as chairman of the Small Land Settlement Commission. In 1903 he was offered the portfolio of the War Office, which, after some hesitancy, he accepted. He at once appointed a commission to report on a reorganization of the War Office. His efforts to bring about a new army scheme were not supported by his colleagues and before any practical steps could be taken the Unionist Parliament and Government came to an end. Arnold-Forster was a profound student of military and naval matters, and was a keen and efficient debater in Parliament. He wrote *Things New and Old* (7 vols); *Our Home Army; A History of England* (1897); *Army Letters* (1898); *Our Great City* (1900); *The Army in 1906* (1907).

ARSENIC. During 1908 arsenic was produced in a commercial way at only two places in the United States, at Everett, Washington, and by the Washoe Copper Company at Anaconda. The Everett plant produced most of its arsenic from arsenical ores mined in California and Washington, with a smaller quantity from flue dusts shipped from smelters at Helena, Montana, and Murray, Utah. The imports of 1908 of white arsenic, metallic arsenic and arsenic sulphides amounted to 4964 short tons, valued at \$430,400. The imports of Paris green and London purple amounted to 195,000 pounds, valued at \$30,764. The principal producing countries for arsenic are Germany, Spain, Portugal, France, India, and Canada. Among its principal uses are as trioxide in glass, as Paris green in pigments, and as insecticides. The use of Paris green in paint is somewhat limited, as, like practically all arsenic compounds, it is poisonous. In 1909 the domestic production of arsenic was increased by the output of a new producer, the United States Smelting Company, which started its arsenic plant at Salt Lake City, Utah. The price was low during the year, but the commercial white arsenic produced in this country being a by-product the production was not materially affected. The greater part of the arsenic consumed was imported from Europe, some also coming from Canada and Mexico. The price at the beginning of 1909 was from 2 7-8 to 3 cents a pound. It fell during the year and at the close was at about 2½ cents.

ARTILLERY. See MILITARY PROGRESS.

ASHANTI. A British possession in West Africa, practically a part of the Gold Coast Colony (q. v.).

ASHOKAN RESERVOIR. See DAMS.

ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, AMERICAN. A learned society, which is a continuation of the American Association of Geologists and Naturalists organized in 1840. The Association was

chartered in 1874. It is made up of eleven sections as follows: Mathematics and astronomy, physics, chemistry, mechanical science and engineering, geology and geography, zoölogy, botany, anthropology and psychology, social and economic science, physiology and experimental medicine, and education. Meetings of the Association are held yearly in different cities of the United States. The annual meeting in 1909 was held in Boston beginning December 27. The registered attendance of members of the Association was 1140, the largest in its history. The address of the retiring president, Professor T. C. Chamberlin, was delivered on the evening of December 22, the subject being, "A Geologic Forecast of the Opportunities of Our Race." This address was preceded by an address of welcome to Harvard University by Professor F. W. Putnam, and was followed by a reception given by the corporation of Harvard University to the members of the Association. On the evening of December 28, a public lecture complimentary to the citizens of Boston was given by Dr. C. W. Stiles on "The Hookworm Problem in this Country in Reference to Public Health," and on the evening of December 30, under the auspices of the Entomological Society of America, a lecture was given by Dr. John D. Smith on "Insects and Entomologists: Their Relation to the Community at Large." On the evening of December 31 a lecture was given by Dr. Percival Lowell on "New Canals of Mars." Meetings of the various sections in joint session with the affiliated societies were perhaps the most successful in the history of the Association as measured by the number of members attending and by the number and quality of the papers presented, and by the interest with which the papers were heard and discussed. The total number of papers presented was 1025. The Council of the Association elected 57 new members, and 229 fellows were elected from those members by the various sections. The following were elected foreign associates: Dr. Hans Hallier of Leyden, Mr. J. J. Taudin-Chabot of Holland, Professor Franz Wiedenrich of Strassburg, and Professor C. Runge of Göttingen. The Council was authorized to elect to membership scientific men of Central and South America. The following officers were elected for the meeting which is to be held at Minneapolis, December 27, 1910: For President, A. A. Michelson, University of Chicago; Vice-Presidents and Chairmen of sections; mathematics and astronomy, Professor E. H. Moore, University of Chicago; physics, Dr. E. B. Rosa, Bureau of Standards, Washington, D. C.; chemistry, Professor G. B. Frankforter, University of Minnesota; mechanical science and engineering, Professor A. L. Rotch, Bluehill Meteorological Observatories; geology and geography, Dr. John M. Clarke, State Geologist of New York; zoölogy, Professor Jacob Reighard, University of Michigan; botany, Professor R. A. Harper, University of Wisconsin; anthropology and psychology, Professor Roland B. Dickson, Harvard University; social and economic science, Senator T. E. Burton of Cleveland, O.; physiology and experimental medicine, Professor F. A. Novy, University of Michigan; education, President A. Ross Hill, University of Missouri; Permanent Secretary, Dr. L. O. Howard, Washington, D. C.; Secretary of the Council, Professor John Zeleny; Secretary of

the section of social and economic science, Fred T. Croxton, Washington, D. C. The membership of the Association in 1909 was about 8000.

ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, BRITISH. A learned society, founded at York, England, in 1831 for the stimulation of scientific inquiry, the promotion of scientific intercourse and the fostering of public interest in science. It holds annual meetings one week in duration. These meetings are held by invitation to some large town in the provinces, and more rarely in the colonies. An annual volume of *Proceedings* is issued, containing complete papers of the addresses of the president for the year and of the presidents of the scientific sections into which the Association is divided. The meeting in 1909 was held at Winnipeg, Canada, and there were in attendance many members of the American Association for the Advancement of Science. Sir J. J. Thompson in the presidential address discussed the recent discoveries of the properties of the negative and positive units of electricity. In the mathematical and physical section, the president, Professor E. Rutherford, continued along the lines of Sir J. J. Thompson's address, with a discussion of the various methods which have been devised for determining the values of certain fundamental atomic magnitudes. Professor H. E. Armstrong, in the chemical section, discussed a large number of the problems which engage the chemical world. Important discussions were carried on in other sections, which include geological, zoölogical, economic science and statistics, engineering, anthropological, educational, physiological and botanical. Among the more important reports submitted to the Association were those on seismological investigation, in which, in addition to the usual statistics of the large earthquakes of 1908, Mr. John Milne discussed the synchronism of earthquake activities in widely separated portions of the earth. The Association meets in Sheffield in August, 1910. The officers of 1909-10 are: President, Sir J. J. Thompson, F. R. S.; General Secretaries, Major P. A. MacMahon, F. R. S., Professor W. A. Herdman, F. R. S.; Assistant Secretary, O. J. R. Howarth.

ASSOCIATION OF AMERICAN AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS. See AGRICULTURAL EXPERIMENT STATIONS.

ASSOCIATION OF AMERICAN UNIVERSITIES. A body organized in 1900 for the purpose of considering matters of common interest in relation to graduate study in American institutions. Its membership in 1909 consisted of the following twenty-two universities: University of California, Catholic University of America, University of Chicago, Clark University, Columbia University, Cornell University, Harvard University, Johns Hopkins University, University of Illinois, Leland Stanford Jr. University, University of Michigan, University of Minnesota, University of Missouri, University of Pennsylvania, Princeton University, University of Virginia, University of Wisconsin, Yale University, University of Kansas, University of Nebraska, Indiana University, and State University of Iowa. The Tenth Annual Conference of the Association was held at Cornell University, Ithaca, N. Y., on Janu-

ary 7 and 8. Four additional universities were elected to membership. These are the last four in the list above. At its meeting in 1908 the Association adopted, as a condition for membership, the presence in the institution in question of a strong graduate school, and, in those institutions which have professional schools in addition to the Graduate Department, the requirement in at least one such school of one or more years of college work as a prerequisite for admission to professional courses, the combination to be so arranged that no professional degree shall be given until the satisfactory completion of at least five years of study. This action defined for the first time what an American university should be from the standpoint of fifteen of the most important of them, and it places all professional study in America in such institutions ultimately upon a graduate basis, in that it proposes in due time to require that all professional work shall be preceded by college work in the manner indicated. The officers of the Association for 1909-10 are: President, Princeton University; Vice-President, University of Virginia; Secretary, Harvard University; additional members of the Executive Committee, Cornell University and Columbia University. The Eleventh Annual Conference in 1910 is to be held in the University of Wisconsin, at Madison.

ASSUR, EXCAVATIONS IN. See ARCHEOLOGY.

ASTOR LIBRARY. See NEW YORK PUBLIC LIBRARY.

ASTROGRAPHIC CHART. See ASTRONOMY.

ASTRONOMY. The year 1909 was unmarked by any especially important advances in observational astronomy. Routine work, of course, went on with its usual regularity at the various observatories. There were, however, no new satellites discovered, as in 1907 and 1908, nor any striking comets like Moorhouse's comet of 1908, which, though never a very prominent naked-eye object, occasioned much research on account of the peculiar behavior of its tail. Halley's comet, the reappearance of which, after an absence of seventy-four years, was looked for as early as the beginning of the year, was discovered in September; and the closeness of agreement between its observed and calculated positions forms one of the most noteworthy triumphs of astronomical prediction. The meeting of the permanent committee of the International Astrographic Congress in April was an event of great importance. Resolutions were adopted at this meeting which will accelerate the progress of the work on the great International Chart of the Heavens and Catalogue of Stars, and have important results in other fields of astronomical research in which concerted action on the part of the observatories of the world is desirable.

THE SUN. Professor W. S. Adams continued the photographic investigation of the rotation of the sun which he has pursued at the Mount Wilson Solar Observatory since 1906. His recent observations were made with the new and powerful spectrograph of the tower telescope, which has shown a marked increase of probable accuracy over the 18-foot spectrograph of the Snow telescope formerly used. One of the most important results of the investigation was the discovery that the hydrogen gas producing the H α line of hydrogen moves with decidedly

greater angular velocity than the general reversing layer, and seems to be subject to a very different law from that of the ordinary equatorial acceleration.

Professor E. F. Nichols, the recently appointed president of Dartmouth College, completed an important investigation at the Mount Wilson Observatory. Its object was the determination of the law of absorption and scattering of light in the solar atmosphere.

SUN SPOTS. Although the year 1908 was marked by the final setting-in of the decline of solar activity of the present sun-spot cycle, still 1909 saw some slight rerudescence of that activity. Several large groups of spots made their appearance on the sun's disc about the end of May and the middle of July. None of them, however, approached in magnitude the largest of the groups noted during the previous year. In September there was a further renewal of activity, culminating in the formation of a large spot which attained its maximum extent on September 25. This, it is perhaps worthy of remark, coincided with the occurrence of a magnetic storm of sufficient intensity to interfere seriously with telegraphic communication over the whole globe.

SATURN. M. Schaefer, of the Geneva Observatory, Switzerland, published further observations of the new outer dark ring discovered by Jarry Desloges at Mount Revard on October 7, 1908, and later observed at Geneva and Greenwich. The existence of the new ring, however, is a matter of dispute, Professor Barnard claiming that, after a most careful search, he was unable to find it.

JUPITER. Professor Lowell published an account of his observations of this planet at Flagstaff during the spring of 1907. The most interesting feature noticed was the system of wisps or lacings which lie between the north and south equatorial belts, forming a network across the equatorial region of the planet. All the dark belts were of a cherry-red color, and even the polar caps at times showed reddish tints. The Great Red Spot was only faintly visible. Other networks similar to the above were detected between the equatorial and tropical belts of each hemisphere.

MARS. The favorable opposition of 1909 afforded an opportunity for further investigation of the markings on the surface of this planet. The principal observers were Lowell at Flagstaff, Arizona, Jarry Desloges at Massagros (Department of Lozère, France), and Jonckheere at Roubaix. A number of new canals were reported, and many striking changes in the configuration of the surface of the planet were observed. Spectograms of Mars and the moon, secured at the Lick Observatory, indicated that there is no appreciable amount of water vapor in the atmosphere of Mars, contrary to the conclusion reached by Lowell from observations made at Flagstaff in 1908.

COMETS. The periodic comets due to return in 1909 were Perrine's (1896 VII.), Winnecke's (1898 II.), Spitaler's (1890 VII.), and Giacobini's (1896 V.). The year passed without the detection of the last two. Perrine's Comet, first observed in 1896, was not seen at its last return in 1903, on account of its small angular distance from the sun at that time. It has a period of about six and a half years. It was discovered this year by Kopff at Heidelberg on August 12, when it was of the fifteenth magni-

tude. It increased slightly in brightness after discovery, and passed through perihelion on October 31, being then of about the twelfth magnitude. Winnecke's Comet, with a period of 5.7 years, passed through perihelion on October 4, but was not discovered until October 31, when it was detected by Porro at the La Plata Observatory in Argentina. These two comets are designated 1909b and 1909d respectively.

Two new comets were discovered: 1909a. A comet of the eleventh magnitude, discovered by Daniel at Princeton on June 15, and independently by Borrelly at Nice on the preceding day, and hence known as Comet Borrelly-Daniel. It presented no remarkable features, declining rapidly in brilliance after discovery. Its perihelion passage occurred on June 3.

1909e. Another comet of the eleventh magnitude, discovered by Daniel on December 6. This, too, like his earlier discovery, was not remarkable in any way.

1909c, the fifth comet observed during the year, was Halley's comet, which was first detected in September. See following paragraph on *Halley's Comet*.

Comet Moorhouse (1908c) continued to interest astronomers, owing to the surprising changes which took place in it. The sloughing of the tails, to which reference was made in the *Year-Book* for 1908, was well shown in a series of photographs taken by the Rev. Joel Metcalf at Taunton, Mass., during the latter part of November, 1908. In one of these photographs the main tail presented a twisted appearance. After perihelion passage on December 25, it was well observed at the Cape of Good Hope, Santiago de Chile, Lick and Melbourne. The changes in the tail recorded at these observatories were in all respects similar to those observed earlier in the northern hemisphere. Spectrum photographs showed the presence of cyanogen and carbon, contrary to what Bredachin's theory would lead us to expect in the case of a comet with a comparatively straight tail. According to that theory, such a tail should be composed of hydrogen.

HALLEY'S COMET. Such widespread interest in the return of this famous comet, which made its last perihelion passage in 1835, had been aroused by the researches of Messrs. Cowell and Crommelin of Greenwich into its past history and the probable date of its next perihelion passage, that search for it began as early as 1908. The honor of its rediscovery belongs to Professor Max Wolf, of Heidelberg, by whom it was observed photographically at the Königstuhl observatory on September 11. Its discovery is one of the most striking triumphs of computational astronomy, for the position calculated for September 11 by Crommelin was R. A.=6h. 18m. 4s., decl.= $17^{\circ} 16' N$, whereas the observed position was R. A.=6h. 18m. 12s., decl.= $17^{\circ} 16' N$. When discovered, it was of about the sixteenth magnitude, and appeared as a nebulous mass with a central condensation. After the announcement of its discovery, it was found that its image had been obtained on two plates exposed at Greenwich on September 9, but, on account of its faintness, the observers there had failed to identify it. As a result of the preliminary observations of the comet, Cowell and Crommelin have recalculated the elements of the orbit, and found that the date of perihelion passage must be advanced about three days, thereby making it

April 19, 1910. It was not observed visually until October 20, about which date it was detected by Wolf, Newall, of Cambridge (England), and others. This was about 180 days before perihelion passage, whereas, in 1759 and 1835, its last two appearances, it was seen 75 and 102 days respectively before perihelion. At the end of the year, its distance from the earth was about 120 millions of miles, and it was approaching the earth at the rate of about 500,000 miles daily. Its nearest approach should occur on May 20, when it will be less than 15 millions of miles distant. It is expected that the comet will transit the sun's disc on May 18, when its tail will probably extend far beyond the earth.

STELLAR EVOLUTION. Professor Moulton, in the *Astrophysical Journal*, discussed the possibility of the fission of a contracting rotating fluid mass in reference to the origin of binary stars. Laplace propounded the hypothesis that such a mass might throw off an equatorial ring, which would subsequently be brought by its own gravitation into an approximately spherical mass. Darwin, on the other hand, was led by his tidal researches to attribute the formation of binary stars to fission caused by tidal strain. Moulton discards the former theory for lack of evidence, and discusses Darwin's theory, which derives support from the mathematical investigations of Jacobi, Poincaré and others on the figures of equilibrium of homogeneous rotating fluid masses. The homogeneity postulated has no existence in fact, however, and Moulton maintains that there is no justification for concluding that, in the solar system, there has ever been any example of fission of a fluid body, although binary stars may be due to fission while the parent mass was still in its original nebulous condition. He concludes that "there are now abundant reasons for rejecting Laplace's hypothesis as applied to the solar system," and suggests that "it may be that the time is ripe for a serious attempt to see if the opposite hypothesis of the disintegration of matter because of enormous sub-atomic energies, which perhaps are released in the extremes of temperature and pressure existing in the interior of suns, and of its dispersion in space along coronal streamers or otherwise, cannot be made to satisfy equally well all known phenomena."

SYSTEMATIC MOTIONS OF THE STARS. Since Kapteyn called attention in 1905 to the fact that the distributions of the proper motions of the stars could be explained by supposing the universe to be divided into two great star-streams, in motion relative to the sun and to each other, the question of the systematic motions of the stars has received an increasing share of attention. The results of the researches of Eddington on the stars of the Groombridge and Carrington catalogues, and of Dyson on a number of selected stars of large proper motion afforded striking confirmation of Kapteyn's theory. In a mathematical discussion of the question, Eddington made the assumption that Maxwell's law of distribution of velocities prevailed in each of the two star-streams. Schwarzschild, regarding the duality of the universe as inherently improbable, made use of a modified law of distribution, in which the resolved parts of the velocities of the stars in one direction were all increased in a given ratio, thus giving a spheroidal instead of a spherical distribution. The

result is that the stars appear to form a single instead of a dual system, the velocity of the stream being directed along the major axis of the spheroid. This method has been applied by Schwarzschild himself to the Groombridge stars, and by Beljawsky to the stars determined by Porter. The deductions from Schwarzschild's hypothesis appear at first sight to be at variance with the deductions of Eddington and Dyson, but, when the relative velocities of the star-streams of the latter investigators are estimated and taken into account, it is found that the two hypotheses lead to results which agree very closely. In fact, the apparent motions of the two divergent streams can be resolved into a motion of the solar system relative to the centre of gravity of the streams, and a motion of the two streams in opposite directions. Thus, Dyson found that his two streams were directed towards points in R. A. 93° , decl. 7° S., and R. A., 246° , decl. 64° S. Taking the relative velocities in the ratio of 3 to 2, the apparent motion of the streams could be resolved into a motion of the solar system with a velocity 1.55 towards a point R. A. 283° , decl. 44° N., and a motion of two streams to and from a point R. A. 88° , decl. 21° N. with a relative velocity 4.04. The following table shows the results obtained for the apex or direction of the sun's motion relative to the centre of gravity of the stars, and the vertex, that is, the common direction of the two opposed streams (Eddington and Dyson), or the major axis of Schwarzschild's spheroid (Schwarzschild and Beljawsky).

	Apex of solar motion	Vertex of stream
	R. A. Decl. N.	R. A. Decl. N.
Eddington	266°	31°
Schwarzschild	266°	33°
Dyson	283°	44°
Beljawsky	281°	36°
	95°	3°
	93°	6°
	88°	21°
	86°	24°

INTERNATIONAL CHART OF THE HEAVENS. The permanent committee of the Astrographic Congress of 1887, at which were inaugurated those great international undertakings, the Astrographic Chart and Catalogue, held its fifth meeting at the Paris Observatory, April 19-24. The programme originally laid down by the Congress comprised (1) the construction of charts of the entire heavens, each chart measuring $2^{\circ} \times 2^{\circ}$, and containing all stars to the thirteenth magnitude; (2) the compilation of a catalogue of the exact positions and magnitudes of all stars to the eleventh magnitude. When the latter is completed, astronomers will have at their command the absolute positions of all down to the eleventh magnitude at a given epoch. It will be possible, therefore, by redetermining the positions of these stars after a sufficient interval, to derive their proper motions easily and with precision, and thus to discuss such problems as precession, star-drift, etc., with a thoroughness at present impossible. The work of constructing the chart and catalogue was originally divided among eighteen observatories. While some of them have practically completed the work allotted to them, others, for various reasons, are far in arrears with their share, and one of the duties of the committee was the assignment of the work still remaining to be done to the more active observatories. The following shows the progress which has been made on both the chart and the catalogue up to the present time:

Observatory	Limits of declinations of centres of plates	Number of plates in zone	Catalogue plates	Chart plates
Greenwich	N. 90°-N. 65°	1149	1149	1149 1006
Rome	64°- 55°	1040	720	103 30
Catania	54°- 47°	1008	590 90	97
Helsingfors	46°- 40°	1008	1008 679	843
Potsdam	39°- 32°	1232	1232 300	280
Oxford	31°- 25°	1180	1180 1180	1180
Paris	24°- 18°	1260	1260 1260	540 373
Bordeaux	17°- 11°	1260	958 819	493 127
Toulouse	10°- 5°	1080	738 698	517 191
Algiers	N. 4°-S. 2°	1260	1260 517	425 335
San Fernando	S. 3°-S. 9°	1260	1260 1125	323 215
Tacubaya	10°- 16°	1260	1260 1121	360 108
La Plata	17°- 23°	1260	1260
Cordoba	24°- 31°	1360	854 299	195
Perth	32°- 40°	1378	1376 195
Cape of Good Hope	41°- 51°	1512	1512 1402	803 1612
Sydney	52°- 64°	1400	1400 705
Melbourne	68°- 90°	1149	1149 1104	1129

Realizing that the speedy completion of the catalogue is more desirable than that of the chart, the committee decided to divide the catalogue work of the La Plata zone, not yet begun, between the observatory of Santiago, the new observatory of Hyderabad, and, if necessary, the La Plata Observatory, to which it was originally assigned; while part of the catalogue work allotted to the observatory of Cordoba will be handed over to the Cape Observatory for completion.

The question of bringing into harmony the results obtained by the different observatories, which up to the present time have been working almost entirely independently, was one which presented itself to the committee for solution. At some observatories the diameters of the star-discs have been measured, at others the magnitudes of the stars have been estimated by comparison with the photographs of standard stars of known magnitude. The committee finally entrusted the formation of an absolute scale of magnitude to a commission of distinguished astronomers, including Professors G. E. Hale and E. C. Pickering from the United States. It is intended that the scale shall be photographic rather than visual. In the meantime, however, the various catalogues will appear as heretofore, each with its own scale of magnitudes, but the methods of determining the magnitudes will be described with such exactness that the translation to the absolute scale finally adopted may be performed without unnecessary trouble.

Other important resolutions were passed, dealing with the organization of a coöperative series of meridian observations on a new fundamental system of stars, and a more extensive system of intermediate stars, by means of which the faint comparison stars already chosen by the committee can be definitely and accurately connected with the fundamental stars. As, in some cases, the positions of the catalogue stars have been referred to comparison stars which have not been determined for years, and in others the comparison stars have been determined only recently, the importance of these resolutions cannot be over-estimated.

With the approach to completion of the work originally undertaken by the committee, other problems calling for international coöperation seem likely to fall within the scope of the committee. Such a problem is presented by the planet, Eros, discovered by Witt in 1897. The nearness with which the planet approaches the earth at opposition gives a peculiar importance

to observations made upon it at that time. At the opposition of 1900, Eros approached the earth within one-third of the mean solar distance and international observations made at that time have given us by far the most accurate measure of the solar parallax yet determined. At the opposition of 1931, Eros will approach even closer to the earth, its distance being then only one-sixth of the mean solar distance. Sir David Gill, in his presidential address at the Leicester meeting of the British Association in 1907, pointed out the importance of early preparation for thoroughly organized international coöperation at such a favorable opposition. Accordingly a committee, known as the "Eros Committee" was appointed for the following purposes: (1) To take steps for the preparation of an approximate ephemeris of Eros at the opposition of 1931 of sufficient accuracy to permit the selection of the most suitable comparison stars. (2) To devise means for the regular observation of Eros from this time forward in order to perfect the ephemeris that will be finally employed in the definite reduction of the observations of 1931. The duty of preparing (1) an approximate ephemeris of the planet for 1931, (2) precise ephemerides for the successive oppositions until 1931, and (3) an ephemeris of high precision for 1931, has been entrusted to Prof. Stromgren of the Copenhagen observatory. These, when completed, will be published in the *American Ephemeris* and other principal official ephemerides. As a result of the observations contemplated, it will be possible to obtain direct determinations of the solar parallax and the mass of the moon, and also a dynamical determination of the earth's mass by means of the perturbations which it produces in the orbit of Eros, which should far surpass anything that we have at present.

MINOR PLANETS. The surprising activity in the photographic exploration of the heavens, which marked the years 1906, 1907, and 1908, seems to have slackened, for the discoveries of the past year fell short of those of 1908 by about fifty. Of the 72 minor planets announced as new, and provisionally designated by the letters FL to JG, no less than fifty-nine were reported from Heidelberg by Wolf (13), and his assistants, Kopff (34), Hellfrich (7), and Lorenz (5). One of those reported by Lorenz (JA, discovered on November 9), had, however, been found two days earlier by Metcalf at Taunton, Mass. Of the remaining twelve, six fell to the share of the Greenwich observers, three to Palisa of Vienna,

three to Metcalf, and one to Boinot of Paris. JC proved to be identical with (50) *Virginia*, while GA turned out to be the seventh satellite of Jupiter; and doubtless others will be identified with discoveries of other years.

Permanent numbers, ranging from 660 to 674, were assigned to the following planets:

1908 CC (=660), CD, CW (*Newtonia*), D, G, DH, DK, DM, DN, DO, DQ, DR, DV, DY, EA, EP (*Rachel*, =674).

The numbers 645 and 655 have been transferred from 1907AB and 1907BS to 1907AG and 1907BF respectively, 1907AB having proved to be identical with (398) *Admete*, and 1907BS with (49) *Pales*.

OTHER EVENTS. Professor C. D. Perrine, astronomer at the Lick Observatory, has been appointed director of the Argentine National Observatory at Cordoba.

American astronomy was honored in the person of Dr. Geo. W. Hill, to whom the Royal Society of London has awarded its Copley Medal for his researches in mathematical astronomy. Dr. Hill was also the recipient of the Bruce Gold Medal, awarded by the Astronomical Society of the Pacific.

BOOKS. Among the more important works published during 1909 may be mentioned the following: Schuster, *Solar Research*; Maunder, *The Astronomy of the Bible*; Hale, *Some Recent Contributions to our Knowledge of the Sun*; Chambers, *The Story of the Comets*; Flammarion, *Astronomy for Amateurs*; *The Scientific Papers of Sir William Huggins*; Turner, *Modern Astronomy*.

ATHLETICS, TRACK AND FIELD. The thirty-fourth annual track and field contests of the Inter-Collegiate Amateur Athletic Association were held in the Harvard Stadium at Cambridge, Mass., on May 28 and 29. The largest number of points were scored by Harvard, whose athletes rolled up a total of 39 1-10. Yale was second, with 25 7-10 points, and Pennsylvania third, with 22½ points. Other colleges which scored points were: Cornell, 20½; Michigan, 14; Princeton, 7; Syracuse, 3; Swarthmore, 3; Haverford, 3; Dartmouth, 2½; Columbia, 2, and Brown 1. Three new records were made at the meet, as follows: Paull, of the University of Pennsylvania, won the mile run in 4 minutes, 17½; seconds; Taylor, of Cornell, won the two-mile run in 9 minutes, 27½ seconds, and Campbell of Yale, won the pole vault by attaining a height of 12 feet 3½ inches. This vault was eclipsed, however, in 1908 at the Athletic Carnival held at the University of Pennsylvania when Dray, of Yale, vaulted 12 feet 6½ inches.

The University of Illinois won the meet of the conference colleges, held at Chicago on June 5, scoring a total of 36 points. Other point winners were: Leland Stanford, 28; Chicago, 21; Wisconsin, 11; Purdue, 8; Minnesota, 6; Colorado, 5; Western Reserve, 4; Miami, 4; Indiana, 4; Notre Dame, 3, and Knox 1. At the fifteenth annual athletic carnival, held on Franklin Field, Philadelphia, under the auspices of the University of Pennsylvania, the two-mile relay was won by Yale in the record time of 8 minutes, 2½ seconds. Chicago won the one-mile relay and Pennsylvania the four-mile. No records were broken in the special events. The principal dual college meets in 1909, with their scores, were: Yale, 55½; Harvard, 48½; Amherst, 64; Brown, 62; Williams, 81; Amherst, 43; Cornell, 76½; Princeton, 40½; Illinois, 73½; Chicago, 52½;

Haverford, 52½; New York University, 51½. Dartmouth won the New England College meet and Bowdoin the Maine College meet.

The senior championships of the Amateur Athletic Unions were held at Seattle on August 13 and 14. The Seattle Athletic Club won, scoring 45 points. Other teams and their scores were: Olympic Athletic Club, 30; Chicago Athletic Association, 26, and New York Athletic Club, 17. The junior championships were held at the same time and place, the Seattle Athletic Club scoring the greater number of points in these events also. The New York Athletic Club was second. A quadrangular meet between the New York Athletic Club, Boston Athletic Association, Chicago Athletic Association, and the Olympic Club of San Francisco was held at San Francisco on August 21. The Chicago Athletic Association scored 53 points, the Olympic Club 49 points, the New York Athletic Club 32 points, and the Boston Athletic Association 10 points. The all-round championship of the Amateur Athletic Union was contested for at Long Island City on July 5. It was won by Martin J. Sheridan, who scored a total of 7385 points, the highest number ever made in this event.

ATOMIC WEIGHTS. See CHEMISTRY.

AUGUR, JACOB ARNOLD. An American army officer, died April 18, 1909. He was born in 1849 and graduated from the United States Military Academy in 1869. In that year he served against the Indians in the west, and in the Ute expedition in 1879. He was instructor in the military academy from 1883 to 1887, and spent the ten years from the latter date in Indian Territory and Texas. In 1900-1 he served in the Philippines, and again in 1907. He was made colonel of the Tenth Cavalry in 1902.

AUSTRALIA, COMMONWEALTH OF. A British dependency consisting of a federation of six original states. The temporary seat of the Federal government is Melbourne.

AREA AND POPULATION. The area of the Commonwealth and the population (exclusive of aborigines), according to the census of March 31, 1901, and the estimate of December 31, 1908, are shown in the following table, by states:

States	Area., sq. miles	Pop., Mar. 31, '01	Pop., Dec. 31, '08
New So. Wales	310,372	1,354,846	1,605,009
Victoria	87,884	1,201,070	1,273,313
Queensland	670,500	498,129	558,237
South Australia	903,690	363,157	407,179
West. Australia	975,920	184,124	270,823
Tasmania	26,215	172,475	185,824
Co'nwealth	2,974,581	3,773,801	4,300,885

The estimated population of the capital cities was (December 31, 1908): Melbourne, V., 101,250; with suburbs, 549,200; Adelaide, S. A., with suburbs, 179,793; Brisbane, Q., within 10-mile radius, 137,670; Hobart, T., with suburbs, 44,610; Sydney, N. S. W., 127,460; with suburbs, 592,100; Perth, W. A., with suburbs, about 54,000.

In New South Wales there were, in 1908, 45,525 births, 16,090 deaths, and 12,642 marriages; in Victoria the birth-rate was 24.58, the death-rate 12.46, and the marriage-rate 7.38 per thousand inhabitants; in South Australia, birth-rate 24.73, death-rate 9.72, and marriage-rate 7.89. The reported immigration to the Commonwealth in 1907 was 71,988; in 1908, 75,671.

EDUCATION. Public education is entirely under the control of the separate states. Primary instruction is free and compulsory. In New South Wales there were 3135 State schools in 1908, with an enrollment of 233,124, and an average attendance of 156,000. The State expenditure on education, science, and art was £1,191,617. The University of Sydney, with over 1000 students, receives a State subsidy. In 1908 there were 702 private schools, with 57,111 pupils. In Victoria the public primary schools had 4721 teachers, an enrollment of 231,759 pupils, and an average attendance of 147,270 in 1907. There are various State institutions for special and technical instruction, and the University of Melbourne, with about 900 students, receives State aid. In Queensland, in 1908, there were 1104 State schools, with 2413 teachers and an average attendance of 67,309 pupils; and 167 private and grammar schools, with an average attendance of 12,898. The State also maintains secondary schools and institutions for special and technical instruction. In South Australia there are reported 707 State schools, with 1389 teachers and 54,560 pupils. Private schools (1907) numbered 209, with 710 teachers and 9381 pupils. Various local institutes, etc., are supported or assisted by the State. An endowed university at Adelaide has upwards of 380 students. A State school of mines and industries has also been established. In Western Australia there were in 1907 395 State schools, with an enrollment of 29,074 pupils and an average attendance of 24,950; and 102 private schools, with an enrollment of 7639 pupils and an average attendance of 6358. In Tasmania public primary schools in 1907 numbered 356, with 25,157 pupils enrolled; private primary schools, 204, with 8830 pupils enrolled. There are 16 superior schools, with an average attendance of about 2000; two technical schools, with (1907) 114 students; and two schools of mines, with (1907) 549 students.

In New South Wales the mineral production in 1908 was valued as follows: Gold, £954,854; silver, £253,920; copper, £502,812; tin, £205,447; coal, £3,353,093; other, £3,114,023; total, £8,384,149. Up to the end of 1908 the total gold output in New South Wales was valued at £56,319,738. In Queensland, the value of the 1908 mineral production was: Gold, £1,975,554; silver, £117,889; copper, £882,901; tin, £342,191; coal, £244,922; other, £281,030; total, £3,844,487. Up to the end of 1908 the value of the gold output in Queensland was £68,290,083.

MINERALS. In Victoria gold mining is of first importance. The gold production of 1908 amounted to 721,220 ounces, valued at £2,949,838. The value of the gold produced from its discovery in 1851, in Victoria, to the end of 1908, was £282,321,433. Other minerals produced include coal, tin, copper, and antimony. In South Australia, copper, gold, silver, lead, manganese, bismuth, iron, and coal are found. In 1907 the total mineral production was valued at £913,863, of which £714,525 represented copper and £36,802 gold. In Western Australia are the largest and most productive of the Australian gold fields. Gold was discovered there in 1886; from that date to the end of 1908 the output amounted to 20,011,098 fine ounces, valued at £85,004,290. The production in 1908 amounted to 1,647,912 fine ounces, valued at £6,999,885; in the first seven months of 1909,

915,189 ounces. Other mineral deposits in the State include magnetic iron ore, lead, copper, and tin. The total mineral output in 1907 was valued at £7,634,066. In Tasmania the total mineral production in 1907 was valued at £2,277,159, of which £869,866 represented copper, £501,881 tin, and £277,607 gold. For the Commonwealth the total value of mineral production in 1907 is stated at about £28,400,000, of which over £13,500,000 represented gold, about £3,523,000 copper, and £3,329,500 coal.

AGRICULTURE. In New South Wales the reported number of acres under cultivation is 2,717,085, the chief products during the year ended March 31, 1909, being as follows: Wheat, 15,483,276 bushels; corn, 5,216,038 bushels; oats, 1,119,113 bushels; potatoes, 71,794 tons; sugar-cane, 144,760 tons; tobacco, 5268 cwt.; wine, 730,262 gallons; citrus fruits, 654,001 cases. The total extent of land alienated and in process of alienation on June 30, 1908, was 51,106,748 acres. On December 31, 1908, the estimated number of live-stock was as follows: Dairy cows, 775,693; other cattle, 2,173,591; sheep, 43,329,384; horses, 590,557; swine, 215,652. In 1908 wool was produced to the amount of 338,129,000 pounds (in the grease), valued at £12,680,000. In Victoria in the agricultural year 1909, 1,779,905 acres were under wheat, 956,371 acres were cut for hay, 419,869 acres were under oats. Wine production was 1,437,106 gallons. In 1908 the total cultivated area aggregated 4,127,000 acres, the principal crops being: Wheat, 1,847,000 acres, producing 12,101,000 bushels; oats, 399,000 acres, 5,201,000 bushels; barley, 63,000 acres, 1,059,000 bushels; potatoes, 54,000 acres, 135,000 tons; hay, 682,000 acres, 682,000 tons. The estimated number of dairy cows at the end of 1908 was 609,166, producing 48,461,398 pounds of butter and 4,328,644 pounds of cheese. At the end of 1907 the total estimated number of cattle in Victoria was 1,842,807 (including 709,279 milch cows); horses, 424,648; sheep, 14,146,734; swine, 211,002. The wool clip in the season of 1908-9 amounted to 93,082,341 pounds, valued at £3,880,000. In 1907 the total agricultural production was valued at £8,375,454, and the total pastoral and dairying production, £12,165,276. Of Victoria's total area, about 27,417,000 acres are alienated or in process of alienation. In Queensland the total area of arable land in 1908 was 733,256 acres, of which 535,900 acres were under crop, yielding a value of £3,462,146. The acreage, yield, and value of the more important crops in 1908 were as follows: Sugar-cane, 92,219 (exclusive of 31,083 acres unproductive), yielding 1,433,315 tons, valued at £933,730 (the sugar produced amounted to 151,098 tons); corn, 127,655 acres, 2,767,600 bushels, £509,647; green forage, 87,675 acres, £438,375; wheat, 80,898 acres, 1,202,799 bushels, £300,700; alfalfa, 48,247 acres, 72,196 tons, £288,784; oaten hay, 9314 acres, 11,600 tons, £92,800; potatoes, 6227 acres, 11,550 tons, £92,400; pineapples, 2171 acres, 598,794 dozens, £84,829; oranges, 2072 acres, 440,312 bushels, £77,055; grapes, 1616 acres, £35,415; pumpkins, 9581 acres, 33,925 tons, £33,925; wheaten straw, 12,086 tons, £33,236. The estimated number of live-stock at the end of 1907 and 1908 respectively were: cattle, 3,892,232 and 4,321,600; sheep, 16,738,047 and 18,348,851; horses, 488,486 and 519,969; swine, 133,246 and 124,749. The wool clip (greasy) in 1907 amounted to 99,461,711

pounds; in 1908, 110,545,577 pounds. Cattle slaughtered in 1908 are reported at 243,069; sheep, 656,297; swine, 134,854. The value of slaughter-house products was £1,181,778. The milk production in 1908 amounted to 63,934,402 gallons; butter, 23,838,357 pounds; cheese, 3,199,510 pounds. Of Queensland's total area, 19,703,325 acres were alienated or in process of alienation at the end of 1907. In South Australia the area under cultivation in 1908 was reported at 3,442,295 acres (including 1,097,186 acres lying fallow), including 1,693,501 acres planted to wheat; hay, 424,924 acres; oats, 78,494 acres; barley, 44,911 acres; potatoes, 8083 acres; vines, 20,855 acres. Wheat production in 1908-9 amounted to 19,397,672 bushels. Citrus fruits, almonds, and olives are profitable crops. The estimated wine output for 1909 was 2,500,000 gallons. In 1908 the estimated number of live-stock was: Cattle, 340,376; horses, 213,385; sheep, 6,898,451. Of the total area (including the Northern Territory), 9,926,534 acres were alienated or in process of alienation at the end of 1907. In Western Australia, the area under crop in 1908 was 494,987 acres. The principal crops were: Wheat, 279,009 acres, yielding 2,925,690 bushels; oats, 457,155 acres, 721,753 bushels; hay, 131,056 acres, 137,511 tons; potatoes, 1854 acres, 5671 tons. In 1909 284,357 acres were under wheat. Mining continues to be the chief source of the State's wealth, but agricultural and pastoral conditions are improving. In 1907 the live-stock consisted of 113,330 horses, 757,077 cattle, 3,684,974 sheep, 53,399 swine, 26,833 goats, and 3212 camels. The wool clip in 1907 amounted to about 20,210,000 pounds, valued at about £812,000. On June 30, 1908, of the State's total area 14,002,939 acres were alienated or in process of alienation. In Tasmania 269,446 acres were under crop on March 1, 1909, and 491,423 under artificially sown grasses. The wheat acreage was 29,103. The acreage and yield of the chief crops in the agricultural year 1908 were: Oats, 54,025 acres, 1,528,002 bushels; wheat, 30,794 acres, 644,235 bushels; potatoes, 54,625 acres, 145,483 tons; hay, 73,859 acres, 98,406 tons. Fruit culture is important. The estimated number of live-stock on March 31, 1909, was: Cattle, 205,827; horses, 39,281; sheep, 1,723,503; and swine, 47,945. The wool clip for 1907 was estimated at 9,596,400 pounds. Of Tasmania's total area, 5,602,422 acres had been sold or granted to settlers up to the end of 1907, and 1,255,354 leased as sheep runs. See IRRIGATION.

MANUFACTURES. Only a few manufacturing industries, except those concerned with the treatment of perishable materials, have attained any considerable degree of development. The more important manufactured products are preserved meats, sugar, wine, spirits, flour, preserved fruits, beer, butter, cheese, etc. In connection with the mines, there are works for ore reduction, and a few iron and steel factories, machine shops, etc., have been established. The leading manufacturing States are Victoria and New South Wales. In Victoria the total number of manufactories, etc., in 1907 was 4530, with an aggregate horse-power of 52,703 and 90,903 persons employed. The lands, buildings, machinery, and plant were valued at £15,148,100; materials used, £18,632,439; output and labor £30,399,045. In New South Wales, in 1907, the reported number of fac-

tories was 4387, representing investments amounting to £13,265,000. The number of employees was 87,194. In Queensland, in 1908, there were 1479 factories; employees 29,510; value of plant and machinery, £4,484,340; value of land and premises, £2,808,563; value of output, £11,242,437.

COMMERCE. Imports and exports of the Commonwealth have been valued as follows:

	1906	1907	1908
Imports	£44,744,912	£51,809,033	£49,786,798
Exports	69,737,763	72,824,247	64,311,058

Of the total export values in 1906 and 1907, respectively, £66,299,874 and £69,816,500 represented Australian produce. In 1907 the more important imports included: Metal manufactures, £5,004,983; cotton and linen goods, £3,626,658; apparel, etc., £3,255,058; machines and machinery, £2,760,211; iron and steel, £2,388,697; woolens, £2,349,285; drugs, chemicals, etc., £1,840,933; silk goods (including velvets), £1,753,908; timber, £1,632,055. The leading exports in 1907 were: Wool, £28,891,830; gold specie, £5,411,572; wheat, £4,801,722; gold bullion, £4,036,067; copper and copper ore, £3,601,812; butter, £2,890,261; hides and skins, £2,782,805; spelter, etc., £1,478,664; mutton, £1,377,502; coal, £1,299,052; flour, £1,296,252; silver bullion, etc., £1,191,907; tin, £1,122,341; tallow, £1,017,047. Imports from and exports to the countries commercially most important were, in 1907:

Countries	Imports	Exports
Great Britain	£31,906,447	£33,975,579
United States	5,869,099	2,405,401
Germany	8,551,255	5,140,380
New Zealand	2,585,264	2,565,021
India	1,948,566	2,494,414
Belgium	1,000,377	5,716,069
Ceylon	755,444	3,962,420
Japan	541,286	706,279
France	486,550	8,148,980

In the foreign trade, imports and exports, respectively, of the several States were as follows, in 1907: New South Wales, £20,860,391 and £29,303,727; Victoria, £17,101,022 and £15,924,405; South Australia, £4,815,459 and £9,269,983; Queensland, £4,617,439 and £7,118,364; Western Australia, £3,587,548 and £8,592,117; Tasmania, £827,174 and £2,555,651. Including interstate trade, the imports and exports of the several States were as follows, in 1908:

States.	Imports.	Exports.
New South Wales.....	£37,642,746	£40,985,759
Victoria	27,197,696	27,196,201
South Australia.....	11,231,470	13,778,534
Queensland.....	9,471,166	12,194,977
Western Australia.....	6,178,197	6,518,020
Tasmania	3,371,862	4,030,766

COMMUNICATIONS. The total length of railways in the Commonwealth on June 30, 1907, is stated at 15,250 miles. The length of telegraph lines in that year was 43,384 miles and the number of post-offices 7521. In New South Wales, on June 30, 1909, there were open to

traffic 3623 miles of government railway and 81 miles of private railway. The telegraph offices 1278, with 15,910 miles of line and 82,249 miles of wire. Post-offices numbered 2319. In Victoria, on June 30, 1908, 3447 miles of government railway were complete; telegraph offices, 1212, with 7037 miles of line. In South Australia, at the end of 1908, 1879 miles of government railway were open to traffic, and 145 miles in the Northern Territory. In Queensland, at the end of 1908, government railways in operation aggregated 3498 miles. In Western Australia, in 1908, the railway open to traffic was reported at 2741 miles. In Tasmania, in 1909, the reported length of railway was 620 miles; the number of telegraph offices, 328, with 4082 miles of wire (including 432 miles of submarine cable). In 1907 the total oversea shipping, entered and cleared at the ports of the Commonwealth, amounted to 8,822,866 tons; in 1908, 8,581,151 tons.

FINANCE. In the fiscal year ending June 30, 1908, the revenue of the Commonwealth amounted to £15,015,798; expenditure, £6,158,893; surplus paid to the States, £8,859,596. In the fiscal year 1909, revenue amounted to £14,349,835; expenditure, £6,419,364; surplus paid to the States, £7,927,134; balance, £3337. Of the revenue for the latter year, £10,843,985 were derived from customs and excise; £3,409,007 from posts, telegraphs, and telephones; and £96,843 from miscellaneous sources. The expenditures were: Posts and telegraphs, £3,027,048; "new" expenditure, £1,531,074; defense, £916,757; public works, £666,713; trade and customs, £277,288; miscellaneous, £484. For the fiscal year 1910, the estimated revenue was £14,555,765, exclusive of £1,200,000, proceeds of sale of treasury bonds; the estimated expenditure was £7,867,621, and the estimated surplus for distribution among the States, £7,891,481. The revenue and expenditure, respectively, and the debt of the separate States are reported as follows: New South Wales, for the fiscal year 1909, £13,625,071 and £12,882,607; debt at end of year, £90,307,419; Victoria, for fiscal year 1908, £8,314,480 and £7,862,246; debt at end of year, £53,180,487; South Australia, for fiscal year 1908, £3,654,666 and £3,171,000; debt at end of year, £29,985,858; Queensland, for the calendar year 1908, £4,608,956 and £4,643,667; debt at end of year, £39,568,827; Western Australia for fiscal year 1909, £3,816,271 and £3,906,839; debt at end of year, £21,951,753; Tasmania, for fiscal year 1909, £934,405 and £960,237; debt at end of year, £1,039,770. The total debt of the States on June 30, 1908, was £243,335,489. See paragraphs on *History*.

GOVERNMENT. The Commonwealth consists of a federation of the six former colonies of Great Britain, now called "Original States." New South Wales, Victoria, South Australia, Queensland, Western Australia and Tasmania. The executive authority is vested in a governor-general, who is appointed by the Crown and is assisted by an executive council of seven ministers. The legislative power devolves upon a Parliament of two houses, the Senate (36 members, six from each State, elected by popular vote for six years), and the House of Representatives (75 members, elected by popular vote for three years). The State Parliaments are elective, but the State governors are appointed by the Crown. The Governor-General in 1909

(from September 9, 1908) was the Earl of Dudley. The Commonwealth ministry in 1909 was constituted as follows: Premier, Alfred Deakin; Treasurer, Sir John Forrest; Minister for Trade and Customs, Sir Robert W. Best; External Affairs, Littleton E. Groom; House Affairs, George Warburton Fuller; Defense, Joseph Cook; Attorney-General, P. McMahon Glynn.

ARMY AND NAVY. The military system of the Commonwealth was under much discussion in 1908 and 1909, with a view to secure compulsory service for all males between the ages of 16 and 26 by means of cadet corps and a national guard. The establishment, as organized in 1909, consisted of a garrison force of 12,000 for both peace and war, and a field force whose peace strength was half that on a war basis, and consisted of 6500 light-horse, with 24 guns and 7500 infantry with 36 guns. Including the garrison troops, the gross strength on a peace basis would be 26,000 and on a war footing 40,000. In addition there would be available the following troops partly trained; 7000 (approximately) light-horse, cadets 9103, and rifle club members 28,721, making a grand total of all forces of 2400 officers and 80,000 men. See paragraph below on *Defense Policy*.

The British fleet stationed in Australian waters, with headquarters at Sydney, consisted in 1908 of twenty cruisers and minor vessels aggregating 47,000 tons. To its maintenance Australia contributes £200,000 annually. See paragraphs on *History*.

HISTORY

IMMIGRATION QUESTION. One of the chief questions in 1909, as in previous years, concerned the opening up of the country to development by means of immigration. There was great need of properly situated lands for immigrant farmers. It was a common subject of complaint that immigrants were compelled to go far into the interior for settlement, passing on the way fine lands which were not under production, being held by individuals for speculative purposes. The absentee landowners were severely blamed. The difficulty was enhanced by the unwillingness of the States to coöperate with the Federal government, or with one another. Australia's need, moreover, was for agricultural immigration, and early in the year the situation was complicated by the danger of an influx of artisans and clerks, for whom work could not be found. The former Premier, Mr. Reid, in March declared himself strongly in favor of aiding immigration, but since even Australians themselves could not get land on account of the large unused private estates, he favored State resumption of lands, upon due notice after valuation, unless within a fixed period the owners cut up the lands for closer settlement. Much has been said on this subject, both by the press and the government officials, during recent years. It has been argued that by immigration alone can the policy of protection, defense, and a "White Australia" be maintained. The Labor party has been blamed for discouraging immigrants, and for the passage of laws which hampered them, apparently for the purpose of keeping Australia for its own people and maintaining the rate of wages. On the other hand, in Victoria, where the Anti-Socialist party has been in control since

the Federation, and the upper house requires, as a qualification for its members, that they shall hold land, the net loss by emigration in 1901-6 was 54,000, and the rural population was less than forty-one per cent. of the total. Only a very small sum had been spent for furthering immigration. Here, as in other parts of Australia, the greatest difficulty lay in the locking up of land which was owned in large parcels by the descendants of original settlers. The landowners, especially the absentees, were not in sympathy with the policy of closer settlement, since the lands were held chiefly for cattle-raising and sheep-raising. The cutting up of land for closer settlement proceeded very slowly. There were complaints in New South Wales that people who wanted land had to go into the back country, that the government was slow in making land available, that the lands were unsurveyed, and the cheaper tracts not yet ready. The government planned to import two thousand skilled farm hands in addition to domestic servants and unskilled farm laborers, but without any guarantee as to wages. The attitude of the Labor party in New South Wales toward immigration was favorable, provided the immigrants were of the right quality, and so long as land was available, but it did not approve of assisting immigration unless immigrants would become producers. The Labor party held that to spend money at the present time for the assistance of immigrants would raise land prices against the native settler, since it would increase, in proportion to the numbers and demands of the newcomers, the value of the land that was already privately held. Thus the Labor party did not approve of state-aided immigration under present conditions.

DEFENSE POLICY. The two chief features of the new Ministry's programme were defense and finance. Early in the year Premier Fisher declared that the question of defense was whether Australia was willing to pay or not. There was no chance of defense, he said, unless Australia would coöperate with Great Britain. Compulsory training was an essential part of the system. Early in February the Federal government decided upon the building at once of two torpedo boat destroyers out of the money voted in 1908. This was regarded as a pledge that the Fisher Ministry would put through the scheme of defense, including compulsory military training. Early in March it was announced that the plan for an Imperial General Staff, so modified as to give the Commonwealth control of its own offices, was accepted by the Federal Cabinet. On March 3 the ministerial programme was definitely announced by the Premier. The plan for naval defense comprised the building of four ocean destroyers and sixteen river destroyers, in addition to those already ordered, to be built in Australia within three years at a cost of £747,000 the first year, £1,012,000 the second year, and £884,000 the third year; the assumption by Australia of its coast defense relieving the Admiralty of the cost of training the present squadron; and the offer of Australia to furnish all torpedo craft, scout and dispatch boats if the Imperial fleet visited Pacific waters. The plan for land defense was to take effect at the beginning of 1910. It was based on the principle of universal compulsory military training. The cost was to be met by a progressive land tax. Public opinion as to the best means of Imperial defense was di-

vided, some favoring exclusively the *Dreadnought* solution, others adhering to the Premier's scheme which, in its later form, offered to place the squadron under the Admiralty. The reactionary element desired the giving up of compulsory training and the plan for the local squadron. On the opening of the Federal Parliament, on May 26, the Governor-General referred to the Imperial Defense Conference and to the General Imperial Staff, and said that the building of three destroyers had been arranged for, and that Parliament would be asked to authorize naval construction and the training of crews; also, that the plan for an effective citizen defense force would be submitted to Parliament. The Opposition, which came into power with Mr. Deakin's Coalition Ministry, had taken issue with the Fisher government on the *Dreadnought* question, blaming it for not giving the *Dreadnought* to Great Britain in the name of the Commonwealth. It favored an Australian flotilla, but did not think this should prevent the gift of a *Dreadnought* in the present emergency. There was a tendency, after the new government's assumption of office, to urge the Ministry to treat the subject of defense as a matter outside of politics and make its policy depend on the decisions of the approaching Imperial Defense Conference. Early in June Premier Deakin telegraphed to the home government the offer of a *Dreadnought* or of an equivalent naval contribution. Opinion was divided throughout the Commonwealth as to the *Dreadnought* offer. Victoria favored it. New South Wales was lukewarm, fearing that the *Dreadnought* offer might be taken as a substitute for a scheme of local defense. Queensland and South Australia were adverse. In July Mr. Cook, the new Minister of Defense, in a public statement declared in favor of a local squadron, providing it became the Australian section of the Imperial Navy. The Australian offer of £2,000,000 was, he said, unconditional. He declared his determination to make the present force efficient by means of training schools, etc., appropriating the necessary funds for the purpose. The platform of the new Coalition Ministry included, among its principal features, universal military training to begin in the schools, and some sort of coast defense. In June the defense situation was summed up by Colonel Foxton, the Australian delegate to the Defense Conference. He declared that Australia had no desire to meddle with the naval agreement that had been in force since 1903; that Australia was now preparing for local defense and the protection of coast routes, for which three river class torpedo boats were now building. It was hoped that this would form the nucleus of a future Australian navy, which in turn would be a part of the Imperial sea force. It would be kept up well, and, if feasible, the Imperial and Australian officers would be interchanged. The *Dreadnought* offer was declared to be unconditional. Opinion in Australia seemed to be in favor of the locally owned squadron. Some offense was caused by the home government's rejection of a scheme submitted for such a flotilla in 1906 and the Admiralty plan, which was brought back from the Imperial Defense Conference, was viewed with some suspicion. In general, popular opinion inclined to Australian participation in Imperial Defense, but was divided on the question whether this should take the form of a contribution of

Dreadnoughts, or of a provision for efficient local defense. On August 21 it was announced that the Australian squadron would consist of about six cruisers, nine destroyers and a small flotilla of submarines. An important feature of the government's naval proposals was the interchange of Australian ships and crews with those of the home country.

As to military defense, the bill of Mr. Cook, the new War Minister, was brought in on September 21. It provided for compulsory training between the ages of twelve and twenty; the junior cadets to give 120 hours a year to physical drill, marching and rifle practice for two years; the senior cadets, 96 hours a year for four years; citizens, sixteen whole-day drills for two years, and the naval artillery and engineer training to last twenty-five days instead of sixteen; men between the ages of twenty and twenty-six to attend one parade a year. The cadet training was to begin in 1911 and the citizen training in 1912, the only exemption being unfitness or non-European descent. The penalty for shirking military duty was to be not less than £5 and not more than £500. It was estimated that this arrangement would provide for 40,000 junior cadets, 75,000 senior cadets, and 55,000 citizens under twenty-one. The militia, which numbered 25,000, was henceforth to be recruited only from these trained men. It was expected that after 1916 the first line would be 50,000 strong, the second 50,000, and the third 140,000. The sum of £2,000,000 was required yearly for defense, including this training scheme. A compromise measure was drawn up, making some concessions to those opposed to compulsory training. The new Defense Bill gave effect to the decisions of the recent Imperial Conference, providing, on Australia's part, for the defense of the Pacific one *Indomitable*, three protected cruisers of the *Bristol* type, six destroyers, three submarines, and auxiliary vessels. The officers and men were to number 2300. It was expected that the vessels for the Australian fleet, which would replace the Imperial Australian Squadron, would be ready by June 1, 1912. The details of the naval defense plan had been arranged between the Australian delegate to the Imperial Conference, Colonel Foxton, and the Admiralty. The naval power of the Admiralty was to pass over to the Commonwealth government. On November 23 the House of Representatives passed a resolution approving the government's naval proposals, and declaring that immediate steps should be taken to prepare the Australian naval unit. Early in December the Defense Bill and a Naval Loan Bill, which authorized the placing of a loan to carry out the shipbuilding programme, passed both Houses. The Australian government invited Lord Kitchener to visit the Commonwealth, and advise as to measures of military defense. Lord Kitchener accepted the invitation and left India for his Far Eastern trip in September.

PARTY POLITICS. The general election of December, 1906, left the three political parties in about the same relative strength as before, and Mr. Alfred Deakin, who had been Premier since July, 1905, continued as chief of the Cabinet. The government was obliged to depend for its support upon the Labor party which, after the elections of December, 1906, numbered 26 as against 19 Conservatives, 14 Anti-Labor members, who supported Mr.

Deakin's financial policy, and 16 Liberals, who followed Mr. Reid. Both the Labor party and the followers of Mr. Deakin supported the principle of the "new protection," that is to say a protection so ordered as to benefit only those industries which conform to certain requirements as to wages and as to manufacturing processes. Other features of the Labor party's programme were the making of a "White Australia," the promotion of Federal unity, and the extension of State control in economic and industrial matters. The principle of the "new protection" was embodied in the Federal Excise Tariff Act passed in 1907. Its constitutionality came in question in 1908 and the Federal high court decided in June of that year that the regulation of wages by excise duties was *ultra vires*. The alliance of the government with the Labor members aroused strong objections, and finally in November, 1908, the Labor members having withdrawn their support, the Deakin Ministry was overthrown, and a Labor Cabinet was formed by Mr. Fisher. The new Labor Ministry soon showed signs of weakness. The Federal Parliament was opened May 26 by the Governor-General Lord Dudley. In addition to the defense programme above-mentioned, the government announced its project for the progressive taxation of unimproved land for the purpose of subdividing estates and furthering an increase of population; and promised to offer an amendment to the constitution to admit of legislation on behalf of the "new protection," that is to say, to enable the government to protect consumers, and insure fair wages, to extend its jurisdiction over trusts and combinations, and to nationalize monopolies. The government also promised to introduce a measure for the appointment of a High Commissioner to London. As to finances, it was announced that in spite of the decrease in customs and postal revenues, arrangements had been made to pay old age pensions by July 1. The new financial obligations, which would be heavy, would be referred to Parliament, as would also the financial relations between the Commonwealth and the States. Proposals would be made for a Commonwealth paper and silver currency. An attempt had already been made to form a coalition of the three opposition groups against the new Ministry. This was difficult owing to the divergent views on the subject of defense and other matters, some wishing to give up the plan for compulsory training and for a local flotilla, some favoring and some opposing the "new protection" idea as well as the financial supremacy of the Commonwealth government over the States. A coalition was, however, formed soon after the meeting of Parliament for the temporary purpose of overthrowing the Ministry. On May 27 the government was defeated on a motion to adjourn by a vote of 39 to 30. The Fisher Ministry resigned, and a coalition under Premier Deakin consisting almost entirely of Moderates was formed. Parliament was adjourned to June 23.

THE NEW MINISTRY. The new government announced its programme at its reassembling on June 23. This consisted of a promise of a measure for an Interstate Commission with the functions of a Board of Trade and a Federal Imperial Bureau including supervision over the customs tariff; an active immigration policy; the appointment of a High Commissioner to

London; and universal training as the basis of the government's land defense policy. Ex-Premier Fisher's motion of want of confidence was rejected by 36 to 24. Later a more definite statement as to the platform of the coalition was issued. The principal features in its policy were the maintenance of the present protective tariff unchanged; a Federal Interstate Commission, which was to decide questions relating to unfair rates referred to it by the State arbitration courts or wage boards; universal military training; a plan for coastal defense; the recognition of Imperial responsibilities; and the postponement of the financial question impending between the Commonwealth and the States. Like most compromises this did not meet fully any party's wishes. The coalition was described as "fusion without principle." On August 12 Sir John Forrest, the Commonwealth Treasurer, introduced the budget. The revenue for 1909-10 was estimated at £14,556,000; the expenditures at £7,868,000, and the amount due the States at £7,891,000. The bill for taking over the Northwest Territory was read for the second time on October 16. The Defense Bill also reached its second reading at this date. The territory included in the former comprised an area equal to that of France, Germany, Belgium, Switzerland and Italy combined. The bill appointing a High Commissioner to London which reached its second reading early in September, was subsequently carried and early in December it was announced that Sir George Reid had been selected for that office.

FISCAL ARRANGEMENT WITH THE STATES. A change of the "Braddon clause," which provided that out of the Commonwealth's custom and excise revenues the States should receive during the first ten years of the existence of the Commonwealth, at least three-fourths and as much more as the Commonwealth did not use, had long been under consideration. These payments would cease on January 1, 1911, unless a new arrangement were made. Conferences of the Premiers were held in March and in August. At the August conference, which was held at Melbourne in the latter part of that month, an agreement was reached by which, instead of the three-fourths which had been hitherto returned to the States, a per capita payment of 25s. was provided. Western Australia was to receive an extra annual contribution of £250,000, decreasing by £10,000 each year until it ceased. It was provided that until the terms of the arrangement became operative £600,000 should annually be deducted from the payments to the States for old age pensions. This awaited ratification by Parliament and by a referendum. There was some doubt as to the result. A lower figure had been accepted than what was previously demanded by the State Premiers. It was pointed out that the new arrangement would make a permanent charge on the customs revenues in favor of the States and defer the consolidation of the debts, but that on the other hand the Commonwealth gained thereby a temporary increase of revenue and the right to dispose in the future of the greater part of the revenue as it saw fit. On September 8 the new Premier asked leave to introduce a bill for the necessary change in the constitution to permit the per capita payment to the States instead of the return of the customs revenue and to authorize the federaliza-

tion of the State debts. This measure, known as the Financial Arrangement Bill, passed its third reading in the House of Representatives in November.

CONGRESS OF CHAMBERS OF COMMERCE. The seventh Congress of the Chambers of Commerce of the empire was opened at Sydney on September 14. Important questions discussed by it were Imperial protection, reciprocity between parts of the empire, preference, an advisory Imperial Council to consider questions of Imperial interest, especially for the promotion of trade between parts of the empire, an Imperial telegraph line, including a complete Imperial route between Great Britain and Canada, Australia and New Zealand, by means of a state-owned line across Canada to Great Britain. On these points resolutions were adopted. The Congress ended on September 24. The results indicated, as had been expected, a strong majority for Imperial preference. This seemed to conform to the general opinion of the public, although leading Australian newspapers were indifferent, and some of the Chambers of the leading cities were neutral. The delegates from the London Chamber of Commerce for the first time assented to the principle of preferential trade. Although public opinion in Australia inclined to preference there was much complaint that British producers would not adapt themselves to the needs of Australian consumers. As to the State ownership of an Imperial telegraph line, the decision of the Congress was in accord with that of the Imperial Press Association, which met in England, and of the Australian Press Association, which at its August meeting endorsed the resolution of the former for state ownership of cables and telegraphs across the Atlantic and Canada.

OTHER EVENTS. A serious industrial dispute arose at Broken Hill mine, which, however, was adjusted early in March. The settlement of this dispute was important as founded absolutely on the principle of the living wage, the judge having declared that he had investigated the conditions of living at the mine and concluded that a certain sum represented the minimum wage. Thus the principle of a living wage was recognized as embodied in the commercial law of the Commonwealth. The New South Wales legislature agreed to cede to the Commonwealth government 800 square miles of the Yass-Canberra district for the Federal capital, control of rivers for water supply over an additional territory of 510 square miles, together with two square miles at Jervis Bay to give access to the sea, and the right to build a railway to that point and to connect with the Goulburn-Cooma State Line. A matter much discussed in Australia during 1909, as well as in previous years, though not forming a question of practical politics, was the question of unification. The opinion was gaining ground in certain quarters in favor of greater centralization. It was desired that the Federal Parliament should be the supreme authority delegating to the provinces only the necessary powers, and that new provinces should be created in place of the present States, which do not correspond to the differences of the respective populations, but represent merely arbitrary boundaries. The criticism of the present organization of the Australian State was that the governmental machinery of fourteen Houses of Parliament was too cumbrous for the needs of the country.

with its scanty population of 5,000,000. The unifiers looked with favor upon any step that tended to increase Federal power.

AUSTRIA-HUNGARY. A constitutional monarchy of Central Europe, consisting of the Austrian Empire and the Hungarian Kingdom, united under one sovereign, besides the common territory of Bosnia and Herzegovina (annexed October 5, 1908). The capital of Austria is Vienna, and of Hungary, Budapest.

AREA AND POPULATION. The area of Austria is 115,905 square miles; of Hungary, 125,608 square miles; of Bosnia and Herzegovina, 19,702 square miles; total, 261,215 square miles. According to the census of December 31, 1900, the population of Austria was 26,150,708, and of Hungary, 19,254,559. Included in the figures for Hungary are Croatia and Slavonia, with 16,410 square miles and 2,416,304 inhabitants. On December 31, 1907, estimated population was as follows: Austria, 27,995,986; Hungary, 20,469,157 (including Croatia and Slavonia, 2,469,157); Bosnia and Herzegovina, 1,828,379; total, 49,292,522. According to this estimate, the Austrian provinces having the largest populations were: Galicia, 7,908,504; Bohemia, 6,659,410; Lower Austria, 3,449,378; Moravia, 2,572,271; Styria, 1,425,196; Tyrol, 901,182; Upper Austria, 837,805; Bukovina, 791,820; Silesia, 744,742. According to language, the population was divided as follows, December 31, 1900:

	Austria	Hungary	Monarchy
German	9,170,939	2,135,181	11,306,120
Hungarian	9,516	8,742,301	8,751,817
Bohemian, Moravian, and Slovak	5,955,397	2,019,641	7,975,036
Polish	4,259,152	4,259,152
Ruthenian	3,375,576	429,447	3,805,023
Croatian and Servian	711,380	2,730,749	3,442,129
Slovenian	1,192,780	98,941	1,291,721
Rumanian	230,963	2,799,479	3,030,442
Italian and Ladin	727,102	27,482	754,584
Foreigners in Austria	517,903	517,903
Others	271,338	271,338
Total	26,150,708	19,254,559	45,405,267

The 1900 census showed the following religious divisions of the people:

	Austria	Hungary	Monarchy
Roman Catholics	20,660,279	9,919,913	30,580,192
Greek and Armenian Catholics	3,136,535	1,854,143	4,990,678
Orthodox Greeks	607,462	2,815,713	3,423,175
Evangelical, Angs.	366,454	1,238,942	1,654,396
Evangelical, Helv.	128,557	2,441,142	2,569,699
Unitarians	104	68,568	68,672
Jews	1,224,899	851,378	2,076,277
Others and without Confession	27,418	14,760	42,178
Total	26,150,708	19,254,559	45,405,267

In 1907 there were in Austria 209,513 marriages, 966,601 births (including still-births), and 654,678 deaths; in Hungary, 201,431 marriages, 755,653 births (including still-births), and 518,614 deaths. Of the births in Hungary, 14,786 were still-births and 72,628 illegitimate.

In Austria in 1905 of the total births, numbering 945,978, 24,214 were still-births and 119,163 illegitimate. The emigration of Austrians in 1907 is reported at 177,354; of Hungarians, 209,174; over 90 per cent. went to the

United States. The largest cities, with estimated population on December 31, 1907, are: in Austria—Vienna, 2,064,037; Prague, 229,965; Lemberg, 185,548; Gratz, 159,625; Trieste, 219,922; Brunn, 121,317; Cracow, 108,031; in Hungary-Budapest, 913,018; Szegedin, 116,158; Maria-Theresiopolis (Szabadka), 82,935; Debreczen, 88,753; Agram (Zágráb), 76,892; Presburg (Pozsony), 74,964; Hódmező-Vásárhely, 64,702.

EDUCATION. In Austria, of the total population in 1900, 16,067,972 could read and write, 778,782 could read but not write, and 9,303,954 could neither read nor write. Elementary instruction is free and compulsory. At the end of 1906 there were in Austria 21,166 elementary schools, with 96,300 teachers and 4,067,243 pupils. Children of school age numbered 4,447,413. There were 110 training colleges for teachers. In 8194 of the elementary schools, the language used was German; in 5496, Czech; in 6448, other Slav languages. In 1909 the number of gymnasias was 267 (including 12 for girls), with 91,627 pupils; of realschulen, 141, with 46,374 pupils. The eight universities maintained by the state had in 1907 about 21,000 students; the eight technical "high schools" in 1908, nearly 10,500 students. In addition to those mentioned, there are many institutions for special study, as schools of theology, music, commerce, agriculture, forestry, etc.

In Hungary, of the total population in 1900, 9,483,930 could read and write, 507,034 could read but not write, and 9,131,376 could neither read nor write. As in Austria, elementary instruction is free and compulsory. In 1907 there were in Hungary 19,167 primary schools, with 42,967 teachers and 2,764,821 pupils. Children of school age numbered 3,573,475. There were 95 training colleges for teachers, with 1110 instructors and 11,331 students. Gymnasias in 1907 numbered 182, with 3487 teachers and 58,881 pupils; realschulen, 42, with 922 teachers and 12,588 pupils. The three universities maintained by the state had about 9700 students. The technical "high school" (polytechnicum) at Budapest had about 1300 students. There are many commercial, industrial, agricultural, and other institutions for professional or technical study.

INDUSTRIES. Agriculture is the leading industry in both Austria and Hungary. Manufacturing industries have gained much more importance in the former than in the latter; also in mining the Austrian is far in the lead of the Hungarian part of the monarchy. The cultivated area in Austria, in 1906, is reported as follows, in hectares: Arable land, 10,637,451; pastures and meadows, 7,114,566; gardens, 368,742; vineyards, 248,933. The area planted to the principal crops, in 1907, and their production, were as follows: Oats, 1,935,710 hectares, 52,232,000 hectolitres; rye, 1,853,577 and 30,825,000; wheat, 1,179,455 and 18,520,000; barley, 1,166,526 and 26,184,000; wine, 237,807 hectares and 4,250,000 hectolitres; potatoes, 1,258,545 hectares and 146,634,000 quintals (of 220.46 pounds); sugar beets, 232,574 hectares and 63,939,000 quintals.

In Hungary, in 1907, the areas planted to the principal crops, and their production, were: Wheat, 3,552,000 hectares and 35,565,000 quintals (of 220.46 pounds); corn, 2,841,000 and 44,084,000; oats, 1,174,000 and 12,143,000; bar-

ley, 1,168,000 and 14,183,000; rye, 1,065,000 and 10,562,000; potatoes, 644,000 and 55,463,000.

The production of beet sugar, especially in Bohemia, is an important industry. The sugar production of the monarchy in 1907-8 amounted to 1,411,600 tons, and in 1908-9 1,386,900 tons, the share of Bohemia being 685,300 tons and 676,600 tons in the two years, respectively. For the agricultural years 1909-10, the estimated sugar output was 560,000 tons in Bohemia and 1,260,000 tons in the monarchy.

The mineral products of Austria-Hungary include iron, lead, zinc, silver, mercury, copper, gold, coal, lignite, salt, and petroleum. The most important metal is iron, the production in Austria of the ore, in 1907, being valued at 21,911,283 kronen, and of the raw metal, 109,695,842 kronen; in Hungary the ore was valued at 11,439,000 kronen, and pig iron, 36,329,000 kronen. The total values of mining and furnace products (exclusive of salt, petroleum, etc.), in Austria, in 1906, were 260,374,095 kronen and 117,952,247 kronen, respectively; in 1907, 294,238,741 kronen and 132,807,655 kronen, respectively. Besides the iron mentioned above, the principal mineral products of Austria, in 1907, were valued as follows: Coal, 129,493,000 kronen; lignite, 125,528,000; lead, 6,993,000; zinc, 6,178,000; silver, 4,131,000; mercury, 2,487,000;—of Hungary: Lignite, 51,887,000 kronen; coal, 14,721,000; gold, 11,479,000; silver, 1,266,000.

The leading manufactures include cotton textiles, tobacco, iron, and steel goods, sugar, beer, alcohol, and spirits, woodenwares, paper, earthenwares, and glass, and leather products. In Austria, in 1909, the number of cotton spindles in operation was 4,412,077 (4,026,460 in 1908), of which about 2,680,000 were in Bohemia. In 1908 cotton spindles in Hungary numbered 171,460. The tobacco industry is a government monopoly; in 1906 there were 30 tobacco factories in Austria and 21 in Hungary. Breweries in 1906 numbered 1271 in Austria, with a production of 20,450,297 hectolitres of beer; in Hungary, in 1907, 89 breweries, with an output of 1,882,385 hectolitres. In 1906 Austria had 39,227 distilleries, producing 1,626,260 hectolitres of alcohol; Hungary, in 1907, 59,547 distilleries, producing 1,127,288 hectolitres. In 1907 Austria-Hungary had 171 paper factories, 288 wood-pulp factories, 43 cellulose factories, and three straw-stuff factories, with a total output of 3,711,630 metric centimes of machine and vat paper. The monarchy ranks fifth in the world's paper production.

COMMERCE. Under an agreement renewable under the Constitution every ten years, Austria and Hungary form a single customs territory. No agreement was reached in 1897, but the commercial union was provisionally maintained until 1907, when a new agreement was made. The special trade of the monarchy (imports for consumption and exports of domestic produce) are reported as follows, in thousands of kronen:

	1906	1907	1908
Imports	2,341,205	2,501,974	2,532,426
Exports	2,380,087	2,457,286	2,324,985

The foregoing figures do not include the imports and exports of precious metals, which amounted to 42,846,000 kronen and 53,121,000 kronen, respectively, in 1906; 43,786,000 and

78,866,000, respectively, in 1907. The figures for 1908 are provisional. The leading imports in 1907 were valued as follows, in crowns: Cotton, 301,700,000; coal, 182,900,000; wool, 145,300,000; common metals, exclusive of iron, 117,400,000; machinery and appliances, 95,700,000; hides, 78,100,000; iron and iron manufactures, 67,400,000; silk, 62,100,000; woolen textiles, 56,000,000; cottonades, 55,300,000; cottons, 53,700,000; leather, 53,700,000; silk manufactures, 51,800,000; coffee, 51,000,000.

The principal exports in 1907 were valued as follows, in crowns: Woods, 280,400,000; sugar, 198,670,000; cottonades, 154,200,000; eggs, 123,235,000; iron and iron manufactures, 98,500,000; lignite, 85,902,000; woolen manufactures, 75,751,000; glass and glassware, 72,810,000; paper and paper manufactures, 69,400,000; cereals (chiefly barley), 61,500,000; malt, 57,965,000; leather goods, 54,500,000; woodenware, 54,000,000; hides, 50,800,000; cattle, 46,853,000; coal (excluding lignite), 30,406,000; wool, 28,300,000; silk, 27,300,000; fowl, 24,620,000; feathers, 24,500,000; hops, 23,735,000; horses, 22,553,000; beer (in casks), 14,848,000; beans, 14,322,000. Provisional figures for the larger classes of exports in 1908 are: Manufactured articles, 1,028,533,000 kronen; raw material, 881,689,000; foodstuffs, 624,787,000; semi-manufactures, 414,043,000; sugar, 227,897,000; cereals, etc., 133,367,000; eggs, 116,179,000.

Imports from and exports to the countries commercially most important were valued in 1906 and 1907 in thousands of kronen:

Countries	1906		1907	
	Imports	Exports	Imports	Exports
Germany	905,514	1,132,596	979,555	1,176,801
United States.....	215,981	59,910	238,877	67,204
Great Britain.....	189,808	281,325	238,599	292,247
Brit. East Indies..	164,069	72,585	185,426	50,823
Russia.....	151,318	69,402	157,778	78,213

Egypt.....	32,925	45,574	36,047	30,876
Rumania.....	33,345	101,042	34,452	110,062

COMMUNICATIONS. The total length of railways in the monarchy at the beginning of 1908 is reported at 27,061 miles, of which 13,497 were in Austria and 13,564 in Hungary. Of the Austrian lines about seven-tenths, and of the Hungarian, about four-fifths, are owned or operated by the state. There is a large amount of steamboat traffic on the rivers and canals. For the navigation of vessels and rafts, Austria has about 4200 miles of river and canal, 830 miles being navigable for steamers; Hungary's navigable rivers and canals aggregate about 3200 miles, of which 2450 miles are navigable for steamers. The Danube forms the most important waterway. In 1907 there entered at the ports of the monarchy 158,386 vessels, of 20,875,703 tons; and cleared 158,275 vessels, of 20,870,888 tons. Of the entrances, 137,728 vessels, of 20,112,072 tons, were steamers; of the clearances, 137,088 vessels, of 20,114,043 tons. The total number of entrances under the Austro-Hungarian register was 128,005 vessels, of 16,795,731 tons; clearances, 127,700 vessels, of 16,704,289 tons. The merchant marine at the beginning of 1908 included 420 steamers, of 443,684 tons, and 14,574 sailing vessels, of 49,-

395 tons. In 1907 the post-offices numbered: Austria, 9143; Hungary, 5450; foreign, 42. In 1907 Austria had 6510 telegraph offices, with 27,011 miles of line and 135,375 miles of wire; Hungary, 4040 offices, with 15,310 miles of line and 84,942 miles of wire. Telephone stations, 1907, in Austria were reported to number 69,600, with 216,960 miles of wire; in Hungary, 39,726, with 154,113 miles of wire; the Austrian telephone stations are reported to have increased to 108,457, in 1908, and 124,825 in 1909.

FINANCE. The cost of administering the common affairs of the monarchy is borne by both governments in a proportion agreed on by their Parliaments and sanctioned by the sovereign. During the ten-year period 1898-1907 the Parliaments failed of agreement, and the sovereign fixed the proportion at that hitherto prevailing. In 1907 the agreement was renewed for ten years. According to this agreement, the next proceeds of the common customs shall be applied to the common expenditure and the remaining expenditure shall be borne in the proportion of 63.8 per cent. for Austria and 36.4 per cent. for Hungary. According to the preceding agreement, these percentages were 65.6 and 34.4 respectively. The monetary standard is gold, and the unit of value, the krone (crown), worth 20.3 cents. According to the sanctioned estimates, revenue and net expenditure have balance, as follows: 1907, 424,740,000 kronen; 1908, 409,711,000 kronen; 1909, 406,840,098 kronen. The revenue represented by the latter figure included customs amounting to 151,338,529 kronen and the matricular contributions amounting to 255,501,569 kronen. In addition, estimated matricular contributions for extraordinary expenditure on the army amounted to 23,047,000 kronen, and estimated receipts from the administration departments to 11,375,184 kronen, distributed as follows: War, 10,130,782 kronen; Foreign Affairs, 723,000; Marine, 381,240; Finance, 138,107; Board of Control, 2055. The estimated aggregate of ordinary revenues, accordingly, was 418,215,282 kronen, and of all revenues, 441,262,282 kronen. The expenditures (ordinary and extraordinary) were distributed as follows: War, 358,022,927 kronen; Marine, 63,819,100; Foreign Affairs, 14,389,584; Finance, 4,893,025 (including 2,640,000 kronen for military pensions); Board of Control, 337,846; total, 441,262,282. No loans are contracted jointly by Austria and Hungary. When the union of the two states was effected in 1867, existing obligations were assumed in common; this debt, on January 1, 1909, amounted to 5,240,025,151 kronen. Of this amount the sum of 5,213,601,172 kronen was interest-bearing, and 5,211,790,273 kronen represented the consolidated debt.

The revenue and expenditure of Austria in 1906 amounted to 2,008,494,779 kronen and 1,862,292,303 kronen respectively; in 1907, 2,253,052,144 and 2,209,092,911 respectively. For 1909 the estimated revenue was 2,404,647,482 kronen, and the estimated expenditure, 1,396,843,236 kronen. The larger items of estimated revenue were: Railways, 566,443,100 kronen; excise, 367,518,000; direct taxes, 334,821,000 (including 172,510,000 personal, and 158,780,000 land, taxes); tobacco monopoly, 251,207,800; posts and telegraphs, 163,792,000; customs, 144,375,000; court fees, 114,597,200; stamps, 58,115,500; salt monopoly, 47,887,200; lottery,

30,540,150. The principal estimated expenditures (ordinary and extraordinary), for 1909 were: Railways, 550,384,570 kronen; public debt, 411,251,520; contribution to the common expense of the monarchy, 310,176,900; posts and telegraphs, 155,530,470; worship and public instruction, 104,618,185; public works, 89,460,754; justice, 92,548,190; civil pensions, 91,627,027; national defense, 87,304,574. On January 1, 1909, the consolidated debt amounted to 4,073,400,260 kronen, of which all but 80,000,000 kronen was interest-bearing; the floating debt, entirely interest-bearing, 60,488,840 kronen; total debt, 4,733,979,100 kronen.

The revenue and expenditure of Hungary in 1906 amounted to 1,357,180,000 kronen and 1,245,469,000 kronen respectively; in 1907, 1,309,474,000 and 1,395,711,000 respectively. For 1909 the estimated revenue was 1,397,010,414 kronen, and the estimated expenditure 1,396,988,349 kronen; for 1908, 1,555,777,976 and 1,555,729,907 respectively. The larger items of estimated revenue were, for 1909: Railways, 327,470,000 kronen; excise, 246,835,000; direct taxes, 240,822,000 (including land tax, 67,830,000; industrial tax, 47,000,000; income tax, 34,529,000; transportation dues, 30,976,000; buildings tax, 30,000,000); tobacco monopoly, 144,152,000; state domains and establishments, 132,590,234; posts and telegraphs, 75,185,000; court fees, 70,323,000; stamps, 45,175,000; salt monopoly, 34,899,000. The principal estimated expenditures for 1909 were: Ministry of commerce, 339,167,240 kronen; ministry of finance, 228,047,567; Hungarian debt, 189,823,887; contribution to the common expense to the monarchy, 86,760,838; ministry of the interior, 81,006,487; worship and public instruction, 72,603,209; ministry of agriculture, 63,908,391; contribution to the common debt, 60,619,340; national defense, 48,548,723; justice, 48,395,962. On January 1, 1909, the consolidated debt stood at 5,211,790,273 kronen, of which all but 26,185,680 kronen was interest-bearing; the floating debt amounted to 984,513 kronen, of which 746,214 was interest-bearing; the total debt was 5,240,025,151 kronen, of which 5,213,601,172 was interest-bearing.

ARMY. The active army of Austria-Hungary has a single organization despite the dual nature of the monarchy, founded in the main on the German model. This "Common Army" in 1909 consisted of 17 army corps, an additional corps being formed on November 1, 1909. The troops stationed in the former military districts of Sarajevo and Zara were formed into the 16th and 17th corps with headquarters at the cities mentioned, the former being in charge of a military governor, Gen. Varesanin von Vares, whose jurisdiction includes the annexed provinces. These 17 corps comprise five cavalry divisions, of which 15 regiments are dragoon, 11 Uhlans, and 16 Hussars, and 34 divisions of infantry, in which are included 468 battalions formed by 106 regiments of the line, four of Tyrolese rifles, and 26 of regular rifles. By a recently completed reorganization of the artillery each army corps is provided with 130 field guns and 24 howitzers, while 24 guns are maintained for the Landwehr division attached to each corps. The heavy artillery includes five siege howitzer divisions, each with four 4-gun batteries on a war footing. There were also 12 mountain batteries and six regiments of fortress artillery. New field guns were issued to

the army during the five years, 1904-9, at an expense of over \$30,000,000.

In addition to the active forces which, maintained on a peace footing of about 319,500 men, could readily be mobilized and organized on a war basis with a strength of about 900,000, there is the Landwehr and Landsturm by which more than a million men could be made available, a number that probably could be trebled by using all classes of these forces. The Landwehr and Landsturm were organized separately in the two kingdoms, being known in Hungary as the Honvédseg and Népfölkelés respectively, and in time of peace entirely under Hungarian jurisdiction. Military service is compulsory and universal to all citizens between 19 and 42 years of age in both countries. Continuous service in the common army lasts for three years, then seven years in the reserve, two years in the Landwehr reserve, after which the soldier goes to the Landsturm until the end of his liability for military service. The military budget for the year 1909 was as follows: Common army, Kr. 334,975,927; Austrian Landwehr, Kr. 51,751,802; Hungarian Honvéd, Kr. 54,387,563; military expenditure charged to Bosnia-Herzegovina, Kr. 5,947,200; the grand total amounting to about \$95,000,000. In 1908 the common army amounted to 22,139 officers, 283,521 men, and 60,197 horses, with in addition 941 officers, 10,046 men, and 1871 horses in Bosnia and Herzegovina. The Austrian Landwehr totalled 3688 officers, 37,273 men and 4501 horses and the Hungarian Honvéd 2880 officers, 25,914 men and 4702 horses. In 1909 there were estimated in effective service 16,842 officers, 4919 officials, 977 employees, 18,102 cadets and reengaged non-commissioned officers, and 271,432 non-commissioned officers and men.

NAVY. In 1909 the effective navy consisted of three first-class battleships, of 10,000 tons each; three armored cruisers, aggregating 19,020 tons; 6 coast-defense vessels, 41,700 tons; three cruisers (3000 to 6000 tons each), 11,500 tons; three cruisers (1000 to 3000 tons each), 7050 tons; 12 torpedo boat destroyers, 4800 tons; 51 torpedo boats, 7467 tons; seven submarines, 2000 tons. In 1909 three first-class battleships, of 14,500 tons each, were under construction, (one had been launched September 30, 1908, another on July 3, 1909, and the third was to be launched in February, 1910), and four first-class battleships, of 20,000 tons each, were projected. The Austro-Hungarian navy, which is maintained in a state of high efficiency, is mainly for coast defense. Two submarines were added in 1909. The personnel in 1908 numbered about 14,500 officers and men.

GOVERNMENT. The common head of the monarchy in 1909 was Franz Josef I., who was born August 18, 1830, and became Emperor of Austria December 2, 1848, and King of Hungary, June 8, 1867. His nephew, Franz Ferdinand, born in 1863, is the heir presumptive. The Emperor-King directs the common administration, under the constitutional compromise of 1867, being assisted by a ministry of three members, for foreign affairs, finance, and war, who are responsible to a common legislature called the Delegations, which convenes each year alternately at Vienna and at Budapest. The common government deals with finance relating to the monarchy as a whole, the army and navy, foreign affairs, the diplomatic, postal, and telegraphic services, and certain state monopolies.

The ministers at the end of 1909 were: Premier and Minister of Foreign Affairs, Count Alois Lexa von Aehrenthal (appointed 1906); Finance, Baron Stephan Burian von Rajecz (appointed 1903); War, General Baron Franz von Schönach (appointed 1906). The Premier of Austria was Baron R. von Bienerth; of Hungary, Alexander Wekerle. Austria and Hungary have each a representative parliament of two houses and a responsible ministry appointed by the sovereign of the monarchy. Croatia and Slavonia and, in Austria, each province have separate diets.

HISTORY

THE FORWARD POLICY. The events of 1909 proved for the time being, at least, the complete success of Baron von Aehrenthal's energetic and aggressive policy. The disasters which were predicted after the annexation of Bosnia and Herzegovina in October, 1908, did not occur. A peaceful adjustment was reached with Turkey, and although for some months a war with Servia seemed imminent, the danger passed with Servia's sudden recognition, at the instance of Germany, of the annexation as an accomplished fact, leaving Servia no hope of support from any European Power. For an account of these events, see the article BALKAN QUESTION. In Austria-Hungary opinion had from the first been sharply divided. The optimists refused to admit that any catastrophe was likely to follow the assertion of sovereignty over the two provinces which Austria-Hungary had governed for thirty years and whose annexation was a logical consequence. Their confidence was shaken for a time when the gathering of troops on the Servian and Montenegrin frontiers proved the seriousness of the Servian crisis. At this critical period the enemies of von Aehrenthal's diplomacy were loud in their censure. The Pan-slavists blamed him for preventing their kinsmen of Servia and Montenegro from taking advantage of unsettled conditions in Turkey to add to their power. The Czechs, Slovaks and Slovenians were heartily in sympathy with Servia and Montenegro and encouraged them to resist the monarchy. The outcome, proving as it did the vitality of the Triple Alliance, humiliated the Slavic element who had repeatedly declared the Alliance of no account, and correspondingly gratified the Germans. The cost of the annexation venture was heavy, but on the whole there was comparatively little grumbling on that account, so great was the relief at emerging from the situation without bloodshed. In the latter part of the year there was a sharp controversy between writers on diplomatic affairs as to the real responsibility for the annexation policy. It was said that the Russian Foreign Minister, M. Isvolsky, had agreed to annexation in advance. He was said to have definitely committed himself to it at the meeting with von Aehrenthal at Buchlau in September, 1908, and circumstantial but conflicting accounts, purporting to be authentic, were published of this and other interviews. Charges of bad faith were made by the friends of both Ministers.

BOSNIA AND HERZEGOVINA. The organization of the annexed territory was provided for in the Annexation Bill which was explained by the Austrian Premier to the parliamentary committee to which it was referred early in February. It was expected that the new Diet would meet in the spring. The principle of election

was to be universal direct suffrage, but with three categories of electors: First, the larger tax payers, persons holding academic diplomas, and all members of Chambers of Commerce; second, urban voters; third, country voters. In all three classes seats were to be distributed according to the numerical strength of creeds, each creed voting separately. The Crown was to appoint the President of the Diet from among the members of each creed in succession. The Diet, which was to consist of 72 members, was to deal only with the affairs of Bosnia and Herzegovina, but these included the control of the budget and all matters of administration. District councils were also to be created. In general the status conferred upon the two provinces was that of restricted autonomy under the hereditary succession of the House of Hapsburg. The laws of December 20, 1879, and February 22, 1880, under which the provinces were administered after the Treaty of Berlin bestowed them on Austria-Hungary, were to remain in force. By these they became the joint possession of the Dual Monarchy, having economic unity and a common customs tariff with the other provinces, and any change in the constitution or in the relations of the annexed provinces with the Dual Monarchy requires the consent of both the Austrian and Hungarian Parliaments. Hungary attempted, after the annexation, to revive certain historical rights over the two provinces, which, she declared, had never been interrupted since the time of the Ottoman invasion, but Austria would not admit them, and the constitution wrought out by the common government maintained the principle of a joint sovereignty. During the period of occupation Bosnia-Herzegovina were under a strictly absolute régime and now that a constitution was abolished, the political grouping that would result became an important question. The inhabitants being Slavs added greatly to the already superior numbers of the Slav element in the empire. Hitherto the differences in the provinces had been religious, not political or racial—involving questions of leadership among the three confessions: Moslems, Greek Orthodox and Catholics. Delegates from each of these bodies, and from the Spaniards or Jews of Spanish descent, were assembled by the government to express their views as to the composition of the Diet and accepted in principle the plan outlined above. As to individual liberty, the constitution guaranteed personal liberty, liberty of property, inviolability of private correspondence, freedom of worship and of conscience, and regulated liberty of residence, right of public meeting and association, the freedom of the press and the right of petition. The government was severely blamed for the action of Baron de Burian, joint Minister of Finance, and Governor of Bosnia-Herzegovina in granting to a Hungarian bank the exclusive right to aid the tenantry of the feudal landowners in the purchase of lands to cultivate, that is, to arrange for the indemnification of the landowners and for annual payments from the tenants. It was charged that the system arranged by the banks was usurious and that the concession was an infringement on the rights of the future Diet of the provinces and on the Austrian right of control. The von Bienerth Ministry narrowly escaped a vote of no confidence in the Reichsrath on account of its negligence in the matter. The plan was afterwards modified.

AUSTRIAN PARLIAMENT. The lower house of the Reichsrath met January 20, but remained in session only about two weeks. Important bills were introduced by the Premier, Baron von Bienerth, on February 3, prescribing the official language to be employed by the authorities in Bohemia, and providing for the reform of the political administration of Bohemia by a division into German, Czech and mixed districts. The Bienerth Ministry had been formed as a compromise and was a Ministry of functionaries, not a parliamentary Ministry representing a majority. It was hoped that a working majority might be found. These language measures, however, revealed a sharp division on national lines, the Germans forming a powerful *bloc* in support of the government against the Czechs and southern Slavs who, on the other hand, were united in the "Slav Union." A working parliamentary majority could not be had in the circumstances. The Czechs were able to put a stop to all parliamentary business. The obstructive tactics of the Czechs led to great disorder in the Chamber. The Premier declared the session closed on February 5. A scuffle ensued between Czech and German deputies in the course of which one member's hand was bitten and another's coat torn off. The members dispersed singing their racial anthems at one another. The Bohemian administration had fallen into a state of great confusion on account of the language difficulty. In certain localities the functionaries were divided into rival camps according to their nationality. The rule that each nationality should be represented in the civil service in proportion to its numbers threw the whole administrative system into disorder. This question of language in the provinces could not be solved by compromise where the minority was strong enough to obstruct the majority, but only where the minority was so feeble that it had to yield completely, as for example in Dalmatia where the Bienerth Ministry brought about a settlement between the Croats and the Italians. The latter, who were only about 5 per cent. of the population, submitted to the establishment of the language of the Croat majority as the official medium, except in some urban districts where Italian was retained. Hitherto Italian as the official language of the Venetian Republics had kept its ascendancy ever since the province had been ceded by Napoleon I.

Baron von Bienerth reconstructed the Austrian Cabinet, replacing the provincial managers of the chief departments by men associated with Parliament. A new session was soon called. Early in the summer session two important commercial measures were introduced. The first authorized the formation of commercial treaties with Servia, Bulgaria, Greece and Montenegro, provided it could be agreed that the importation of live cattle from those countries into Austria-Hungary should be prohibited. This was opposed by the Agrarians and for the time being prevented. The other bill established a central market for the exportation of cattle and cattle products. It was provided that Austria's entire share of the customs revenue on cattle, namely 63 per cent., should be paid out in premiums on exportation. This was characterized as an Agrarian measure and unjust to the industrial communities on which the taxes to make good this deficit would fall. The Finance Minister made his Budget statement in the latter part of October, an-

nouncing a deficit of about \$8,700,000, after the proposed taxes had gone into effect. Among the new revenue measures were a succession duty, tax on mineral waters, tax on bachelors, progressive tax on the dividends of joint stock companies exceeding 10 per cent., and increase of the income tax. Upon the decision of the Austrian Cabinet on October 30, to advise the Emperor to sanction bills passed by the Diets of Salzburg, Upper and Lower Austria, and Vorarlberg making German the sole language of these provinces, the two Czech members of the Ministry resigned.

FISCAL REFORM. Owing to the heavy drain on the public revenues resulting from the annexation, the government faced a serious deficit, and even before the new Reichsrath met, the Minister of Finance, von Bilinski, whose calculations had been upset by the preparations for war with Servia, issued treasury bonds to the amount of 220,000,000 crowns. On the meeting of the Reichsrath a vote of lack of confidence was passed against him for exceeding his powers, but Parliament recognizing the seriousness of the situation as an excuse, ratified the measure. Apart from these extraordinary expenditures, the cost of administration was steadily increasing. Financial necessities tended to increase more rapidly in Austria-Hungary than in other countries owing to the national rivalries which tended greatly to increase the number of officials and the cost of schools. A cumbrous and costly administrative service resulted from the need of appointing functionaries for each nationality in proportion to its numerical importance throughout all grades of the service. Expenditures for education mounted rapidly, owing to the fear of one nationality that it might fall behind another. New revenues were necessary and the Finance Minister was obliged to devise a measure of fiscal reform. Hitherto the provinces had raised their revenues from an additional levy on the objects of the state's direct taxation. The communes did the same. These additions to the state's taxes amounted in some cases to nearly half of the amount raised by the state, and in some it even exceeded that proportion. They did not suffice, however, and the state had been obliged to turn over to the provinces a part of the taxes previously imposed by itself. In spite of these concessions the provincial budgets continued to show a deficit. Thus the new fiscal measure had to provide for these provincial necessities, as well as meet the heavy Imperial demands. The latter arose not only from the cost of annexation, war preparations, etc., but from the comprehensive measure of invalid and old age pensions, which applied not only to the organized industries, but to all the small manufactures and small cultivators. As to the provinces, the Finance Minister's project abandoned definitely the principle of provincial participation in Imperial receipts, and offered instead a fixed sum, amounting the first year to 105,000,000 crowns, and thereafter increasing by 2,000,000 crowns yearly, a convention on this basis to be made with the provinces and to continue in force till 1918. As to the Imperial revenues, it proposed increased duties on alcohol and beer; increase of the income tax and succession duties and higher passenger and freight rates on the railways. The Reichsrath in general feared to impose these new and heavy burdens. The socialists refused to consider any increase of the indirect taxes, proposing instead increased

taxes on acquired wealth, personal property, stock exchange operations, dividends, etc. The opposition saw an opportunity for obstruction, with a view to extorting concessions. No progress could be made with the project during the summer session and it was evident in view of the government's feeble majority that it would have to be radically changed.

A prospect for the suppression of the obstructive tactics in the Reichsrath, which had been so conspicuous a feature in its sessions for a number of years, was afforded in September by the action of the Poles, Social Democrats, Christian Socialists, and most of the Slavs, who united in adopting an urgency measure, which was brought in by the leader of the Young Czech party. This empowered the President to put an end to technical obstruction in Parliament. Preparations were made for introducing a bill which would effect this purpose.

AGRAM TREASON TRIAL. One of the elements of danger in the difficulty with Servia (see BALKAN QUESTION) was the sympathy of the Slav subjects of the empire with the Servians. There were signs of a pro-Slav movement in Croatia, and fifty-three persons were arrested on the charge of high treason in having taken part in a design for the separation of the provinces of Croatia, Slavonia and Bosnia from the empire to form part of a "Greater Servia." It was reported that a man who had made bombs which were to be used against Prince Nicholas of Montenegro, had confessed and accused the defendants of taking part in this pro-Serb conspiracy. There was much hostile comment on the government's conduct of this case, the evidence being considered trivial and unlikely to establish such serious charges. The affair also increased popular ill-feeling in Servia against the Austrian authorities. Nevertheless the trial proceeded and the sentences were rendered on October 5. Thirty-one were condemned to terms of penal servitude for the most part short, but in two cases twelve years each; and twenty-two were acquitted. The condemned were also required to pay the costs, which amounted to nearly \$15,000. The results fell far short of those demanded by the prosecution, which had asked for five death sentences and twenty years of penal servitude.

THE FRIEDJUNG CASE. For two or three years past the press had made frequent allusions to an alleged movement in the southern Slavic Provinces against Imperial unity. There was evidence, it was said, of a pan-Serb conspiracy for the formation of a united south Slavic Province, and its detachment from the empire. The movement was thought to extend throughout Dalmatia, Croatia, Slavonia, and Bosnia-Herzegovina and the annexation of the last-named provinces led to increased efforts on the part of the supporters of von Ahrenthal's policy to suppress the alleged conspiracy. In December, 1908, the *Reichspost* printed specific charges against certain parties and individuals in these southern Slavic Provinces, and these denunciations were repeated by Dr. Friedjung in the *Neue Freie Presse* on March 25, 1909, who supported them by documents from official sources. As a result of this, libel suits were brought by the incriminated persons against the *Reichspost* and Dr. Friedjung. The trial of the latter concluded in December with a complete vindication of the alleged conspirators. Dr. Friedjung, who is well known as a historian and was sup-

posed to have taken due care in testing the accuracy of the documents, admitted that two of them were forgeries and declared that he did not wish to base his charges on any of the others. Thus the conspiracy was, so far as any evidence could be adduced, found to be purely mythical. This ending of the affair was regarded as likely to prepare the way for better relations between the empire and its southern Slavic states.

HUNGARIAN CABINET CRISIS. The long standing issue between Austria and Hungary was discussed again more bitterly than ever. In Hungary the demand for a mere union in the person of the sovereign was renewed and preparations were made for economic independence even before the expiration of the term of compromise. The chief articles in the programme of the Independence party were: A customs barrier between the two countries, an independent Hungarian bank of emission, and the establishment of the Hungarian regiments as a national army. These aims if realized would sever the two parts of the empire, and were therefore opposed by all who desired the continuance of Austria-Hungary as a great Power. Count Andrássy's franchise reform measure, which had been introduced in November, 1908, was indefinitely postponed in January. The Hungarian Coalition Ministry, which had been in power since 1906, announced its resignation on April 26, 1909. The ostensible ground was the refusal of the government to render the two joint state banks independent though associated. The real grounds, however, were said to be the failure of the Ministry to make its promise of universal suffrage effective and the lack of moral support from the Chamber. The crisis was prolonged by the government's unwillingness to concede the demand as to the banks or to extend the use of the Magyar language in the Hungarian regiments of the joint army. The government also desired an increase of the annual recruiting on the basis of a two-years service and demanded the revenues necessary for this purpose as well as for the measure necessitated by the annexation. It was difficult to find a Hungarian Ministry that would take office on these terms. M. Francis Kossuth and Count Julius Andrássy saw the Emperor on June 8, but no Cabinet was formed and the crisis continued. In July unsuccessful negotiations were made for a Ministry from the Independence party. Later in the month, however, the crisis was deferred by the reappointment of the Wekerle Cabinet, which had resigned. This was only a temporary expedient. The Ministry resigned again in the latter part of September, finding that the members of the coalition could not agree. It was thought that an Independence Ministry under Kossuth would ultimately succeed, but at a meeting of that party on November 11, he lacked 46 votes of a majority, and threatened to withdraw if his colleagues insisted in their extreme demands, namely for a separate Hungarian State Bank and the formation of a Cabinet from the majority. The Crown was disinclined to make any "national" concessions. M. Kossuth declared that if none could be obtained he would go over to the Opposition. It was thought that the question which divided the Independence party could be decided only at a general election, which was expected in January. The crisis was still unbroken at the end of the year.

OTHER EVENTS. When the danger of war with Servia was over, there was a great demonstration of gratitude and of loyalty to the Emperor, a large crowd assembling in the courtyard of the Castle (April 18). In July there were popular demonstrations at Prague and other Bohemian cities against the Agrarian opposition in Parliament to the ratification of the treaties with Servia and Rumania which permitted the importation of meat and grain into Austria-Hungary. The Socialists were active in organizing meetings to express the popular discontent at the high price of food. The centenary of the battle of Aspern was celebrated in May and was attended by the Emperor. The Emperor's 70th birthday was celebrated on August 18. On August 28 the Hofer Centenary of the War of Independence of 1809 was celebrated at Innsbruck, where the Emperor, who was received with great popular enthusiasm, laid a wreath at the foot of the Andreas Hofer monument. During the first week in September the sixteenth International Medical Congress held its session at Budapest. The number of members enrolled was 4300. During the year there were signs of a change of opinion in certain quarters as to the part that Austria had taken in the Balkan crisis. There was a tendency to blame von Aehrenthal less and M. Isvolsky more, and to place a greater degree of responsibility on the statescraft of Ferdinand of Bulgaria. (See BALKAN QUESTION.) No accurate accounts of the cost of annexation to Austria and the expense involved in the trouble with Servia were issued, but a leading Austrian newspaper estimated it at nearly \$68,000,000.

AUTOMOBILES. The manufacture of automobiles in 1909 was greatly in excess of the output of any previous year in the history of the industry. The Association of Licensed Automobile Manufacturers estimates that nearly 115,000 automobiles of all kinds were manufactured in the United States in 1909. At an average price of \$2000 the value of this output would be about \$230,000,000. The development of this industry is perhaps without parallel in industrial history. The output of cars in 1903 was about 11,000, and the output in 1906 a little over 30,000. The increase in seven years has been, therefore, about ten-fold. A conservative estimate put the probable output in 1910 at 150,000 machines, while other estimates run as high as 200,000. The spread of the automobile was notable during 1909 in the Pacific Coast States and in the Central Western States.

Of the output in 1909 about 90 per cent. were gasoline pleasure cars, while the remainder were cars propelled by steam or electricity. The chief tendency during the year was shown in the production of low-powered, medium-priced machines. In large cities the cars that sold for about \$3000 found their best markets, but in country districts the demand was for smaller machines running down in price from \$3000 to as low as \$500. As a result of this demand for cheaper cars many of the manufacturers who had hitherto built only large cars began the production of the smaller type.

Two important features in automobile construction characterized the year. Both indicated a tendency toward standardization in the building of cars. These were the practically universal adoption of the magneto as a means of ignition, and the general use of the shaft drive in preference to the chain. The latter improvement had

indeed been adopted in 1908, but this was used even more generally in 1909. In earlier years the magneto was used on the more expensive engines and the battery on those of cheaper manufacture. In 1909 the magneto was used even on the cheapest cars either alone or in connection with the storage or dry battery, one system acting as a reverse in case the other gave out. During the year the four-cylinder motor held its place as the accepted type of road engine. While it was agreed that the six-cylinder gave a smoother running car and greater ability for hill climbing it was also proved that the extra cylinders added to complications in running and added expense of manufacture.

The year was notable for the remarkable spread of the taxicab in large cities. The number in New York practically doubled during the year. It was estimated at the close of 1909 that 1500 were in use. Taxicabs also had been introduced in the smaller centres of population. The introduction of larger commercial vehicles used for heavy trucking has gone forward, although the number of those in use has not been as great as their utility and economy of operation would seem to warrant. Heavy trucks are, however, being used by express companies, department stores and other industries which require heavier forms of trucking.

An important decision was rendered during the year by Judge Hough in the United States District Court of New York on the famous Selden patent cases, which have been in litigation for some years. Judge Hough sustained the patent, holding it valid, and infringed by those who illegally used it. This patent was filed by George B. Selden in Rochester, N. Y., in 1879, as application for a patent on a road locomotive of a design substantially the same as that of the present day gasoline automobile. The patent lay in the patent office for more than sixteen years, or until 1895, during which period various American and European constructors had developed and were marketing actual cars, apparently without any knowledge of the Selden patents, but along lines generally agreeing with the description of his claim. Selden instituted suit for infringement against various firms and individuals, building, selling or using the machines alleged to infringe. A number of the original manufacturing firms had conceded the validity of the patent and had formed an organization known as the Association of Licensed Automobile Manufacturers. These firms coöperated with Selden in an effort to establish the validity of the patent. The Selden patent expires in 1912, when any firm will be at liberty to build gasoline automobiles without regard to patent rights.

Automobile fire engines were used somewhat more extensively in 1909 than in 1908, although motor apparatus is still most widely used in suburbs and small cities, in communities where high speed renders it possible to cover a much greater territory by a single company. In hose carts, trucks, and hook and ladder trucks, there was considerable development in 1909.

In 1909 there were imported 1645 cars valued at \$3,071,000 as compared with 1347 cars valued at \$2,558,819 in 1908. There were exported in 1909, 3686 cars valued at \$6,899,031 as compared with 2164 cars valued at \$4,346,293 in 1908. These figures show material increase in the unit value of the cars exported and a large reduction in the unit value of the imports. The average value of exported cars is now practi-

cally the same as the average value of the imported machines. Of the 1645 bought abroad in 1909, 928 came from France, 418 from Italy, 127 from Germany and 101 from England. The cars exported went to all parts of the world, Africa, East India and Australia, as well as Canada, Europe and South America. Exports to the United Kingdom were valued at \$2,000,000; to Canada, \$2,400,000; France, \$846,000; Mexico, \$494,000; South America, \$240,000; British Australasia, \$303,000 and to Africa, \$49,000.

RACING EVENTS. The most important racing event of the year 1909, was the contest for the Vanderbilt cup, which was held on October 30 over the Long Island course. Twenty-five cars competed, all being of the high-powered stock variety. The race was won by a six-cylinder Alco, driven by Grant, which covered the distance of 278 miles in 4 hours, 25 minutes and 42 seconds. The average speed attained was nearly 63 miles per hour. There was no race for the Grand Prix which, under international rules, had been introduced at Savannah in 1908. The abandonment of road racing in Europe was primarily responsible for the failure to conduct another international meet. Aside from the contest for the Vanderbilt cup the most important racing event were those held at Lowell, Mass., Philadelphia, Pa., Santa Monica and Oakland, Cal., and Riverhead, L. I. The highest speed over a considerable distance was made at Riverhead, where a course of 200 miles was covered at the average rate of over 70 miles an hour. The year was especially noted for the popularity which track racing attained. Three twenty-four-hour races were held at Brighton Beach, N. Y., in one of which a new world's record of 1196 miles was made by Mulford-Patschke in a Lozier. Indianapolis and Atlanta were other centres of track racing, special motordromes having been constructed for the purpose. The only contests held in the Indianapolis course resulted in the loss of five lives and put an effectual damper on the sport. Several endurance tours were held in the United States during 1909, but the Glidden tour turned out to be a failure owing to the few entries and bad roads. The route taken was from Detroit to Kansas City, through Denver, a distance of over 2500 miles. Other distance runs were from Washington to Boston and return, and from New York to Atlanta.

Several new speed records were made during the year. At Minneapolis, on September 11, De Palma drove a Fiat 1 mile in 50 $\frac{1}{2}$ seconds; 10 miles, in 8 minutes, 49 $\frac{1}{2}$ seconds, and 25 miles, in 22 minutes 59 $\frac{1}{2}$ seconds. The record for 100 miles was eclipsed at New Orleans on February 21 by a Buick car driven by Burman, the time made for the distance being 1 hour, 42 minutes and 39 $\frac{1}{2}$ seconds. Noteworthy motordrome records established were: Half-mile (flying start), 14.08 seconds, made at Brooklands, England, by Hemery in a Benz car; 1 mile, 37.7 seconds made at Atlanta, Ga., by Strang in a Fiat car; 10 miles, 7 minutes .01 seconds, made at Atlanta by Strang in a Fiat car; 15 miles, 12 minutes 32 $\frac{1}{2}$ seconds, made at Indianapolis by Oldfield in a Benz car; 50 miles, 40 minutes 14.1 seconds, made at Atlanta by Strang in a Fiat car, and 100 miles, 1 hour 24 minutes 8 seconds, made at Atlanta by Chevsolet in a Buick car.

AUTOSEROTHERAPY. This method of treating pleural effusions, first suggested by Gilbert of Geneva, was used in 168 cases by Marcon and Tchigaeff during 1909. Marcon makes an exploratory puncture in cases of pleural effusion; if the fluid is free from pus he reinjects from 1 to 5 c.c. of it directly again into the subcutaneous tissue through the same needle, which is not withdrawn, the direction of the point being merely altered to bring it into the desired spot. The injection is repeated at intervals of two or three days. Marcon believes the remarkable benefit is due to the stimulation consequent upon the formation of an antipleuritic substance or antibody by the injection of a product of the pleuritis. In most cases the effusion is rapidly reabsorbed, particularly those of recent formation. An advantage of the method is that there is less risk of formation of adhesions and of retractions than when thoracocentesis is done. See also SERUM THERAPY.

AVIATION. See AÉRONAUTICS.

BABCOCK, JOHN BRECKINRIDGE. An American military officer, died April 26, 1909. He was born in New Orleans in 1847. He enlisted in the Civil War, and reached the rank of major. After the war he took part in the campaigns against the Indians in the southwest. A medal of honor was awarded him for meritorious services. He was made a brigadier-general in 1903. In the war with Spain he served as brigadier-general of volunteers.

BABCOCK, JOSEPH WEEKS. An American legislator, died April 27, 1909. He was born in Swanton, Vt., in 1850, and removed West with his parents in 1855. He engaged in the lumber business in Wisconsin. In 1888 and 1890 he served in the Wisconsin Assembly and was elected to Congress from 1893 to 1907. He was chairman of the National Republican Congressional Committee in the campaigns of 1894, 1896, 1898, 1900 and 1902.

BABYLON, EXCAVATIONS IN. See ARCHÆOLOGY.

BACON, ROBERT. An American diplomat, nominated in December, 1909, Ambassador to France. He was born in 1850, and graduated from Harvard University in 1880. He was for many years member of the firm of J. P. Morgan & Co., and in 1905 was appointed Assistant Secretary of State. Following the resignation of Elihu Root, Secretary of State in 1909, Mr. Bacon was appointed Secretary of State for the remainder of President Roosevelt's term. He is a member of the Board of Overseers of Harvard University and a member of the Central Committee of the American National Red Cross.

BAHAMAS. About 20 inhabited islands and many uninhabited isles and islets, southeast of Florida, constituting a British colony. The capital is Nassau, on New Providence island. The area is stated at 4404 square miles; other estimates place it at 5450. The population in 1901 was 53,735; estimated, 1908, 60,283, mostly negroes. There were, in 1907, 46 government schools, with 6026 pupils; 16 aided schools, with an attendance of 1199; 27 Anglican schools with an enrollment of 1541; and 13 private and 4 Roman Catholic schools with 181 and 492 pupils enrolled respectively. Sponge gathering is an important industry. Pineapples, oranges, bananas, tomatoes and other fruits and vege-

tables are cultivated. Sisal culture is increasing in importance. Sponge exports in 1908 were valued at £94,161; sisal, £42,627; pine-apples, £11,856. The principal imports are food-stuffs, wines and spirits, cotton goods and hardware. In 1907 and 1908, total imports were £372,937 and £369,490 respectively; total exports, £233,232 and £183,558; revenue, £89,694 and £81,861; expenditures, £79,790 and £99,655; public debt, £66,680 and £63,124. The Governor in 1909 was Sir William Grey-Wilson.

BAIN, ROBERT NISBET. An English scholar and librarian, died in May, 1909. He was born in 1854 and was educated in private schools. He was engaged in business until 1883 when he was appointed assistant librarian of the British Museum, a post which he held until his death. He was a profound student, and was a specialist in Scandinavian and Slavonic studies. Among his published works are: *Gustavus III. and His Contemporaries* (1894); *Hans Christian Andersen; a Biography* (1895); *Peter III., Emperor of Russia, 1762* (1902); *The First Romanovs, 1613 to 1725, a History of the First Muscovite Civilization and the Rise of the Modern Russian State* (1905). He also edited and translated the works of many Scandinavian and Slavonic writers.

BAKELITE. See CHEMISTRY, INDUSTRIAL.

BALDWIN, ELIAS JACKSON. An American capitalist and mine owner, died March 1, 1909. He was widely known as "Lucky Baldwin," and was one of the most picturesque of the remarkable group associated with the discovery of gold in California and Nevada. Baldwin was born in Butler County, Ohio, in 1828. After some years spent on a farm he started, in 1850, for the West. He arrived in San Francisco almost penniless. After many vicissitudes he bought an interest in the Ophir mine, one of the Comstock lode properties in Virginia City, Nev. The mine was generally supposed to be a poor one, but Baldwin by secret examinations discovered its riches, and secured options on a controlling portion of its stock. His profit in this was over \$3,000,000. Other successful speculations followed, combined with dealings in real estate, until his fortune exceeded \$20,000,000. His lavish expenditures made him famous. He built the famous Baldwin Hotel in San Francisco at a cost of over \$2,000,000. This was burned in 1898, without insurance, and this disaster marked the ebbing of Baldwin's fortunes. His great properties, including a ranch of 40,000 acres, became encumbered, and soon but little of his fortune remained. At the age of 75 he went to Alaska to make another, but returned without it. By the sale of various properties he was able to clear the debt from his ranch, and there he spent his remaining days.

BALKAN QUESTION. INTRODUCTION. The acute crisis which was expected to follow the course of Austria-Hungary and Bulgaria in violating the treaty of Berlin as against the rights of Turkey, was deferred till 1909. Prince Ferdinand of Bulgaria declared Bulgaria's independence, it will be remembered, on October 5, 1908. Two days later Austria-Hungary, after giving notice to the Powers, announced the annexation of Bosnia and Herzegovina to the Imperial Monarchy, promising them a constitution and at the same time, by way of compensation, declared that the Sanjak

of Novi-Bazar would be given back to Turkey. On the same day the Cretan authorities declared Crete a dependency of Greece. For a time it was feared that war was inevitable, but there were soon signs that the points at issue would be adjusted by negotiation. As to the Cretan question, the Powers promptly warned the Cretan authorities that they would undertake negotiations on the subject with Turkey, only on condition that order was maintained on the island. Negotiations between Turkey and Bulgaria, and Turkey and Austria-Hungary were pending at the close of 1908 with prospects of a satisfactory settlement. As to the proposed conference of the Powers signatory to the treaty of Berlin, Austria-Hungary and Russia could not agree on a programme, the former holding that the abrogation of Article 25 of the treaty should be matter of separate agreement between her and Turkey in advance of the Conference, and Russia insisting that the Conference should be left freely to discuss the subject of annexation. Austria on December 10 indicated a willingness to discuss the subject with the other Powers in advance of a Conference to which the discussion would afterwards be submitted. On December 23 Russia notified the Powers that she had consented to this and also to Austria's direct negotiation with Turkey, believing that the Conference would have the ultimate decision. Baron von Bienerth informed the Reichsrath, on December 17, that the condition of holding a Conference was that an agreement on its programme be reached in advance. The Italian Foreign Minister, Signor Tittoni, had previously (December 4) shown a tendency hostile to the policy of Austria by declaring that not Turkey alone, but all the Berlin signatories were concerned with the annexation. Montenegro demanded the cession of Spizza in Dalmatia, and Austria-Hungary having refused this in December, Montenegro organized a boycott against Austro-Hungarian goods. Negotiations between Turkey and Montenegro resulted in an agreement upon a slight readjustment of the frontier. Such in brief was the course of diplomatic events to the close of 1908. The main issue in the year 1909, lay between Servia and Austria-Hungary, in which countries popular feeling became so embittered as at one time to threaten war. The points in this dispute, as well as the terms of Turkey's claims against Austria-Hungary and Bulgaria, will be found in the succeeding paragraphs.

THE AUSTRIAN AND BULGARIAN INDEMNITIES. The principle on which Austria seemed at first to take her stand was that having taken nothing from Turkey she could not admit Turkey's right to claim compensation. She urged that she was giving back more than enough in restoring Novi-Bazar. But the Turkish boycott of Austrian goods, which prevailed in the closing months of 1908, brought Austria to a more serious view of the situation and she finally acceded to certain of the Turkish demands; namely, the increase of Turkish customs duties to fifteen per cent., the establishment of Turkish monopolies in cigarette paper and matches, the personal and religious freedom of the Moslems in Bosnia-Herzegovina, the eventual suppression of the Austrian post-offices in Turkey, modifications of the capitulations and abrogation of certain privileges as to the Albanian Catholics. But to the demand of

Turkey for an indemnity of 100,000,000 francs Austria at first refused to accede. Later, however, she offered 50,000,000 francs and finally struck a bargain at £T2,500,000 (62,500,000 francs). These negotiations took place in January and February, 1909, and the protocol embodying the above terms between the two countries was signed on February 26. It was approved by Turkey on April 5, after a debate of nine hours in the Turkish Chamber. Between Bulgaria and Turkey the question was soon marked by a great divergence as to the amount of indemnity for the Oriental Railway and the Rumelian tribute, the Bulgarian government offering 80,000,000 francs and the Turkish government claiming 120,000,000 francs, and insisting also, at first, on the rectification of the frontier. This latter demand was vigorously opposed in Bulgaria, where the mobilization of a division of the army was begun, and for the moment war seemed inevitable. At this point, however, Russia offered a rather ingenious solution of the problem in a compromise which would apparently not sacrifice either party. Under the Convention of 1882 Turkey was required to pay Russia an annual indemnity of 8,000,000 francs in gradual liquidation of the war debt of 1876. This yearly payment had still 74 years to run. Russia offered to remit the annual payment for fifteen years, which would thus come to the 120,000,000 francs claimed by Turkey from Bulgaria. In return for this Bulgaria was to turn over her indemnity to Russia, but Russia was willing to accept only the 80,000,000 francs which Bulgaria regarded as the outside limit of her indemnity to Turkey. Thus Turkey would receive all that she asked for and Bulgaria would pay no more than she was willing to pay, Russia standing the loss. This was received with approval in Bulgaria, but at first somewhat doubtfully in Turkey, whose government not only preferred cash, but was somewhat suspicious of Russian meddling. After a short consideration Turkey offered as counter-proposal the immediate payment of her war debt to Russia. To this Russia replied that it was better to separate the two questions and to consider first the difference with Bulgaria. The essence of this Turkish proposal was that Turkey would renounce all claims against Bulgaria if Russia would consider Turkey's war indemnity to her as already liquidated in full. In spite of the failure to agree, a settlement of the question by peaceful means seemed at this stage promising and Bulgarian troops were withdrawn from the frontier and her reservists disbanded. Finally on March 16 the protocol between Russia and Turkey was signed at St. Petersburg, by which instalments of the indemnity, sufficient to enable Turkey to borrow £5,000,000, the amount that she claimed from Bulgaria, were to be capitalized at five per cent. and Russia was to agree to the liquidation of the balance at four per cent. The agreements signed between Turkey and Bulgaria settled all questions between the two governments and Turkey acknowledged the independence of Bulgaria.

QUARREL WITH SERVIA. The trouble with Servia arose from racial aspirations. Austria on the face of it owed Servia nothing, for she had taken nothing away, Bosnia and Herzegovina being dependencies of Turkey. But the large proportion of Bosnia was Serb. The annexation not only roused Servia from her dream

of a "Greater Servia," which should comprise the Serb elements in the provinces, but stirred the suspicion that Austria's ultimate object was the annexation of Servia itself. Some went so far as to say that, since it was certain that Austria would ultimately absorb Servia, it would be good policy to bring on a war, which would result in their conquest, to be sure, but would unite them with their fellow Serbs under Austrian rule; in other words, they favored the sacrifice of their independence for the sake of strengthening their nationality. It was also urged that in the event of war Russia would be forced by her strong Slavophile tendencies to take Servia's part. The dispute dragged on for months without settlement. (See SERVIA, paragraph *History*.) Servia desired the strip of territory that would join her territory to Montenegro and give her access to the sea, though she did not officially formulate the demand. Austria declared such a claim untenable, and declared that any demand for territorial compensation must be disavowed. There was no further discussion for a time, but a state of irritation prevailed in both countries. Servia's course compelled Austria to hold herself in readiness for war at any moment. France, Great Britain and Russia favored a policy of conciliation, urging that Austria should make some concessions, but from this the German government dissented on the ground that Austria had already given sufficient pledge of her peaceful intentions. The Powers then decided to bring pressure to bear upon Servia, but Russia wished at first to exercise her influence alone. The Russian Note to Servia declared that there was no hope of territorial aggrandizement, but that if Servia gave up this demand the Powers would do their best to gain for her certain important economic concessions. Servia needed new commercial outlets. It was in fact possible for Austria to stifle her trade. But Servia still hoped that a Conference of the Powers would grant her some compensation. Against this idea Austria had consistently protested from the first. Austria began to prepare for war early in the year, reinforcing her troops on the frontier and in Bosnia, and by March the military preparations amounted to actual mobilization. Anger against Servia for keeping the empire in suspense in this matter steadily increased. In March, Servia agreed to the Russian request that territorial compensation should not be demanded, and in an official note informed the Powers that she renounced her claim to any sort of compensation and that, having every confidence in the justice of the Powers, she left the whole affair to the decision of a European Conference. Austria was not satisfied with this, but desired an explicit declaration that would cancel the statement previously made by Servia, that she would not accept Austria's annexation of Bosnia. Austrian opinion was irritated by what she considered an attempt on Servia's part to shelter herself behind a Conference of the Powers. Austria now had recourse to commercial pressure. The treaty of commerce between Servia and Austria was to expire on March 31. The Austrian Minister at Belgrade, Count Forgash, informed the Servian government that owing to the attitude of Servia for some months past it was unlikely that Austria could induce the Parliament to agree to a new commercial treaty, but that Austria would resume trade negotia-

tions as soon as she received assurances that Servia would return to a peaceful and neighborly attitude. On March 10 Servia addressed a Note to the Powers, declaring that she had no intention of provoking a war with the Imperial Monarchy; that she would continue to fulfill her duties as neighbor and that, confiding in the wisdom and justice of the Powers, she had placed her cause in their hands as a competent tribunal, not demanding therefor, any compensation from Austria-Hungary, whether territorial, political or economic.

SERVIA'S HUMILIATION AND THE TRIUMPH OF GERMAN DIPLOMACY. The Austrian press immediately pronounced this declaration of Servia insufficient and the Austrian government through its minister, Count Forgash, presented its demands, saying that Austria would take the necessary measures to enforce them if they were not met. Several days were allowed for consideration. Meanwhile Great Britain, France and Russia intervened for the purpose of devising a formula that should be acceptable to both Servia and Austria. A new formula prepared by Great Britain was rejected by Austria which proposed one that in turn was not acceptable to Great Britain and France. While the Powers were considering the sending of a new proposal, Baron von Aehrenthal submitted a second one which was almost identical with his first. At this juncture Russia took Europe by surprise by the sudden announcement of her agreement to the Austro-Turkish understanding and her recognition of the annexation of Bosnia and Herzegovina as an established fact. The formula which Servia finally accepted on March 31 expressed Servia's conformity with the decision of the Powers as to the annulment of Article 25 of the Treaty of Berlin, and of the consequent recognition of the annexation of Bosnia and Herzegovina, and her promise to adopt an attitude of good neighborhood and dismiss her reserves. On April 8 the Powers finally gave their assent to the abrogation of Article 25 of the Treaty of Berlin, thus recognizing the annexation. The action of Russia on this occasion was the most sensational event in the European diplomacy during the year and gave rise to very extended discussions. Her change of front as to Servia's demands without consultation with the Powers with which she had formerly coöperated was attributed to the energetic demands of Germany. The Russian Note made no reference to a European Conference or to international ratification. It came without warning to France or England, and was generally regarded as a backdown from the position which she had formerly held, and which those countries had assumed largely by the force of her example. This was attributed solely to the fear of a war with Germany which was thought to have been threatened by implication in the German diplomatic communications. The incident was compared to the course of German diplomacy in 1905 when under similar circumstances France was driven to the Conference of Algeciras. Undoubtedly the peaceful adjustment of the dispute with Servia was due to this action of Russia. Great Britain and France did not hold out for any concessions to Servia and there was now no difficulty in the way of adjustment. Public opinion in Russia was deeply stirred by what was considered her humiliating retreat. Slavophile feeling had been aroused by the Austrian annexation which

was regarded as an encroachment of Pan-Germanism. On the news of it the first to broach the subject of a Conference was M. Isvolsky, the Russian Foreign Minister. At the same time the Russian government had from the first refused to regard the annexation as a possible *casus belli* and it was already known in Austria that in spite of the insistence of the British and Russian Press there was really no force behind their demands. Isvolsky's course was criticised as placing Russia in a position which she could not hold and allowing her to give the impression of insisting on something that she was not prepared to enforce. So it seemed that Germany, realizing that force was the only effective argument, brought the matter squarely to an issue and Russia was compelled to back down. Such was the general tenor of the comments on the affair in the European press. In Russia all classes united in condemning her diplomacy. The *Novoe Vremya* declared that M. Isvolsky's change of front might destroy Russian influence in the Balkans for a hundred years. Only the Moderate Right defended it. According to newspaper reports at the time the German demands were laid before an urgently summoned Council of Ministers and were couched in such terms as to leave Russia no alternative but mobilization, whereupon the majority voted acceptance. It was also currently said that Germany had already made military preparations and that there was an active propaganda carried on in Germany for fomenting an insurrection in Russian Poland.

OTHER EVENTS. There was a tendency in certain quarters during the year to blame Austria less for her Balkan policy and to lay more of the responsibility upon Ferdinand of Bulgaria. It was pointed out that in the first place he had co-operated with Austria in order to secure Bulgarian independence, and then made advances to the Russian government which did not approve the annexation. When the crisis in Bulgaria and Turkey on the question of indemnity became acute, he let it be known that Russia's intervention would be acceptable. Such a course was popular in Russia on account of the strong Slavophile sentiment and accordingly the Russian government intervened. Ferdinand's next aim was to secure Russian recognition of his kingship. To this end he sent a telegram on the death of the Grand Duke Vladimir, indicating his wish to attend the funeral. To refuse this request would have given offense, and equal offense would be given if on accepting it Russia did not recognize him as king. Under the circumstances Russia decided to receive him as a sovereign but declared officially that this would not in any way prejudge the question of his recognition. Nevertheless it would not be easy for Russia to disregard this previous action of hers if a Conference should be held. The course of Ferdinand on this occasion and others was praised for its shrewdness. Early in the year disturbances were reported in Novi-Bazar owing to friction between the Serbs and the Moslems. The Albanians burned two Serb villages and a number were killed and wounded on each side. The Albanians offered resistance to the Turkish troops who tried to restore order and two Albanian villages were burned. Early in the year the Macedonian question came up in the Turkish Chamber and it was reported that racial conflicts still continued and that the inhabi-

tants were carrying arms in violation of the government's orders. There was also trouble in the Rumelian vilayets over the question of the churches, and the Premier advised that the minority in the community should have the right to build churches. The Chamber expressed confidence in the government and asked for a bill to suppress the Macedonian disorders. (See TURKEY, paragraphs on *History*). It was announced that on April 2 the Russian government declared to the signatory Powers of the Berlin Treaty, that since Russia had consented to the repeal of Article 25 it seemed no more than fair to repeal the provisions of Article 29, which restricted Montenegrin sovereignty. It asked the Powers to consent to this repeal. On April 8 the Italian Minister on behalf of the Powers offered proposals for the settlement of the Montenegrin difficulty. Montenegro in reply agreed that Antivari should keep its commercial character, declaring its confidence in the good relations with Austria and its willingness to abide by the repeal of Article 25 as regarded Bosnia. Early in April Great Britain, Italy and Germany recognized the annexation of Bosnia and Herzegovina, consenting to the abrogation of Article 25. The Austrian government published an order for the discharge of the reserves in Bosnia and Herzegovina. Amicable arrangements were reached in the same month between Austria and Servia as to a commercial treaty. It was understood that as a result of negotiations between Italy and Montenegro and between Montenegro and Austria, the question as to Article 29 was satisfactorily adjusted. Before the end of April, France and Russia having consented, all the Powers had formally agreed as to the annulment of Article 25. Austria conceded an autonomous administration to the Moslems, as to religious matters, endowments, and schools. In November disturbed conditions were reported as still continuing in Macedonia where the attitude of the Bulgars was causing anxiety.

BALLINGER, RICHARD ACHILLES. An American lawyer and cabinet officer. He was born in Boonesboro, Ia., in 1858, and graduated at Williams College in 1884. He studied law and on his admission to the bar began practice in Seattle, Washington. In 1890-2 he was United States Court Commissioner, and later was Judge of the Superior Court of Jefferson county. He was Mayor of Seattle from 1904 to 1906, and in 1907 was appointed Commissioner of the General Land Office, which office he held when he was invited by President Taft to become Secretary of the Interior in his cabinet. Mr. Ballinger took an active part in the prosecution of persons for land frauds in the northwest. He was a member of the law firm of Ballinger, Ronald and Battle, and was considered one of the ablest lawyers on the Pacific Coast. For an account of the controversy resulting from his attitude toward public lands and irrigation projects, see LANDS, PUBLIC, and UNITED STATES.

BANK, CENTRAL. See CENTRAL BANK.

BANKS AND BANKING. The year opened with an easy money market and the general banking situation free from disturbing factors. This was true of conditions in England, Ger-

many and France, as well as in the United States. The great abundance of money led to interest rates below the normal during the greater part of the year. During the first six months money on call could be had from New York banks at less than 2 per cent., and even down to 1 per cent.; time loans were uniformly below 4 per cent. until the third week in August, and gold was being shipped abroad at interest rates as low as 2½ per cent. Nevertheless the outstanding circulation of national banks steadily increased. (See NATIONAL BANKS.) The Bank of England maintained a discount rate of 3 per cent. until about April, but was thus practically excluded from the English money market. It therefore reduced its rate to 2½ per cent. At the same time money was lending in London at 1½ to 1¾ per cent and in Paris at as low as 1⅓ per cent. American gold exports aggregated \$60,000,000 during the first half year and \$130,000,000 for the twelve months; about one-half of this was for South America, \$55,000,000 to the Argentine Republic alone. About \$30,000,000 were sent to Japan. The total gold exports exceeded those of any preceding year, and the vast sums sent to South America formed a unique feature of the year's banking.

In spite of the apparent excess of money in the New York market, foreign bankers continued throughout the year to place large sums in this country. Fully \$100,000,000 was so placed during the single month of June. This unusual situation was explained by the keen desire of foreign bankers to lend; by the extraordinary amounts of new securities being carried by American bankers; by the presence in the stock market of large interests carrying enormous blocks of widely diversified stocks; and by the profit from importing money, the rates of exchange being near the gold export point throughout the year.

During August a change in the general banking situation became manifest. Western banks began to withdraw deposits from New York banks preparatory to crop movements. The latter banks held surplus reserves amounting to more than \$30,000,000 in January, and to \$34,259,000 on July 17, but early in September the surplus reserves had fallen to \$3,166,000, being much below the average for that time of year. Early in October this surplus fell to \$1,600,000, the lowest at that date in twenty years. Call loans advanced to 3 per cent. by September 18, to 4½ per cent. by October 2, and to as high as 6 per cent. at numerous times during the succeeding three months. Time loans during this time were at about 5 per cent. Early in September the Imperial Bank of Germany advanced its rate from 3½ to 4 per cent., with the avowed purpose of checking the excessive stock speculation in Berlin. Near the middle of October the Bank of England advanced its rate to 3 per cent. and followed this with other advances up to 5 per cent. At the same time the Imperial Bank of Germany put its rate up to 5 per cent. These facts indicated clearly a worldwide tightening of the money market. The causes of this were the general revival of trade, the flotation of immense amounts of new securities, and an almost unprecedented volume of stock speculation, especially in New York and Berlin. Thus bank reserves had been reduced while loans and discounts had been increased.

The total stock of gold held by the New York Associated Banks in November, 1909, was \$246,-

880,000, or \$55,220,000 less than in November, 1908; that held by the Bank of Germany was \$241,795,000, or \$31,480,000 less; that held by the Bank of England was \$176,725,000, or only slightly less. On the other hand the Bank of France held the enormous sum of \$711,900,000 in November, 1909, or \$44,000,000 more than in November, 1908; and the Bank of Austria held \$284,950,000, or \$41,000,000 more. These great banks thus held altogether about the same amount of gold on these two dates, thus indicating that the new stock of gold mined in 1909, amounting to about \$440,000,000, had gone into South America, Japan, smaller European banks, and American banks outside of New York.

A statement of the aggregate banking power of the United States and of the entire resources and liabilities of all banks and banking institutions in this country, including island possessions, was prepared by Prof. A. Piatt Andrew, expert adviser to the National Monetary Commission. This summary of reports for April 28, 1909, was the first complete statement ever made on a uniform basis for all banks. It showed the aggregate resources of the 22,491 banks included to be \$21,095,054,000. These included loans and discounts, exclusive of overdrafts, \$9,924,816,000; securities, \$4,614,442,000; and mortgages, \$1,378,701,000. The liabilities included deposits subject to check, \$6,956,502,000; time deposits, \$1,211,831,000; savings deposits, \$4,926,161,000; capital stock paid in, \$1,800,036,000; and surplus and undivided profits, \$1,834,625,000. As compared with 1908 the aggregate assets were \$1,512,000,000 larger, while they were just double those of 1900.

The loans and discounts were about ten per cent. larger than in 1908. About 57 per cent. of the loans were secured by collateral, including real estate. The demand loans secured by collateral amounted to \$1,939,635,000, of which about 60 per cent. were placed by New York city banks. The time loans secured by collateral amounted to \$2,036,358,000, and those secured by real estate amounted to \$1,127,276,000. Time loans with two or more names, unsecured by collateral, amounted to \$2,539,965,000, of which one-third was placed by banks in the Eastern States and one-third by those in the Middle Western States.

The aggregate deposits exceeded those of any previous year, showing an increase of somewhat more than \$1,250,000,000 over those of 1908, and being about double those of 1900. Of the deposits 15 per cent. were held by New England banks, 43.3 per cent. by banks in the Eastern States, and 22.7 per cent. by those in the Middle Western States. National banks held 34.4 per cent. of the total deposits, savings banks, 20.4 per cent., loan and trust companies, 20.2, State banks, 17.6 per cent. and private banks, 1.4 per cent. Assuming a population of 89,000,000 the average per capita deposits were \$157.70, as compared with \$146 in 1908.

GUARANTY OF DEPOSITS. The guaranty of bank deposits became an important issue immediately after the crisis of October, 1907, through the advocacy of William J. Bryan and its subsequent adoption in the Democratic platform. The enactment of a State guaranty law by Oklahoma in December, 1907, at once aroused wide discussion of the subject in the Great Plains States. During 1909 Oklahoma modified her law on the subject and Kansas, Ne-

braska, South Dakota and Texas enacted new ones.

During the fall there were several failures of Oklahoma State banks, giving a rather severe test to the new system. In September the Columbia Bank and Trust Company of Oklahoma City, the largest bank in the State, failed with large liabilities. The entire guaranty fund was consumed and a special assessment was made necessary. The failed bank held reserve deposits of a number of other banks in the State. These latter resented paying the full assessment while unable to get their deposits. The bank was apparently in sound condition on September 1, and it was therefore charged that its funds had been maliciously manipulated. Pending an investigation of the affair by the State Banking Board the indictments of the accused officials were held up by Governor Haskell. Somewhat later two other banks failed and the guaranty fund was again wiped out. Whereas in the preceding case some dissatisfaction resulted from the payment of local depositors first and more distant ones later, in these subsequent cases some dissatisfaction resulted from the payment of some depositors in the bank's commercial paper and the inability to pay others anything by the close of the year. These failures made it possible for outside critics of the deposit guaranty idea to point out certain alleged tendencies. It was stated that the guaranty law, putting good and bad bankers on a level as regards the depositor's safety, made it possible for unscrupulous bankers to secure large deposits by paying very high rates of interest on them. It was even charged that some bankers were paying more than the 4 per cent. (or 3 per cent. on deposits left in bank less than six months), as prescribed by law, by making interest payments personally. It was stated also that a speculative element had been introduced into banking, leading to a mushroom growth of banks; and that the risk to promoters was reduced to a minimum, as shown by the fact that the majority of the new banks were capitalized at the legal minimum of \$10,000. It was pointed out that numerous State and national banks had reorganized with small capitalization, thus reducing the safety of the banking system and the checks to speculative methods. While critics outside the State were asking what, in the light of the above experience, would happen if several leading banks should fail simultaneously, and declaring that the real test of the whole system would come at time of financial stringency, the bankers of Oklahoma themselves were protesting their general faith in the successful outcome of the experiment and pointing to greatly increased business under it. The law was modified by the 1909 legislature by providing that, instead of a reserve fund of 1 per cent. of average annual deposits, a fund equal to 5 per cent. of the total deposits of State banks shall be accumulated by assessments not exceeding 2 per cent. in any one year. If at any time the guaranty fund prove inadequate, the banking board is authorized to issue 6 per cent. certificates based on the subsequent 2 per cent. assessment. Banks are prohibited from advertising that their deposits are guaranteed by the State. The modified law also requires that 75 per cent. of the guaranty fund shall be invested in those securities in which the State invests its own money,

the other 25 per cent. being retained in cash. A case testing the constitutionality of the Oklahoma law was taken to the Supreme Court of the United States in September, 1908, and was still pending at the close of 1909.

The Kansas law, in effect June 30, 1909, authorized State and national banks voluntarily to form a guaranty fund under the State banking department, by contributing annually not more than five assessments of one-twentieth of 1 per cent. of deposits. National banks, however, were forbidden to participate by the Attorney-General of the United States, on the ground that the law does not permit them to pay assessments to meet the obligations of other banks. National banks in Kansas at once formed an insurance company, which by the terms of its policy guaranteed to make good to any failed bank holding one of its policies any portion of its liabilities not covered by assets. This scheme, with slight modifications of certain original details, was upheld as lawful by Attorney-General Wickersham in May. The guaranty law was subsequently declared unconstitutional by Justice J. C. Pollock, of the United States District Court, at Topeka, as in violation of the Fourteenth Amendment.

The Nebraska law, in effect July 2, was like that of Oklahoma in being compulsory on all State banks. It authorized the banking board to levy four semi-annual assessments of one-half of 1 per cent. to establish a guaranty fund, this fund thereafter to be maintained by semi-annual assessments of one-twentieth of 1 per cent. The law does not guarantee immediate payment, but authorizes emergency assessments not exceeding 1 per cent. annually. The maximum legal rate of interest that banks may pay on deposits is put at 4 per cent.

The Texas law provides two schemes, both voluntary. One provides for the accumulation by each bank individually of bonds, approved by the State Banking Board, equal in amount to twice the deposits. The other is a mutual plan, the banks entering it being required to accumulate a fund of \$300,000, to be used in paying losses of depositors and to be kept intact.

The new South Dakota law does not qualify as a full-fledged guaranty law. It requires the participation of at least 100 banks with aggregate capital of at least \$1,000,000. These banks are to form an incorporated association, with a charter fee of \$100 and an annual premium of one mill on each one dollar of average daily deposits. This will create a deposit insurance fund, to be supervised by the State Bank Commissioner, and from which losses of depositors of failed banks are to be paid on the insurance principle. The law limits the interest that may be paid on deposits to 5 per cent.

Two bills were introduced in the Colorado Legislature, but one was passed by the Senate and the other by the House, and no compromise agreement could be reached regarding them.

There can be no doubt that the deposit guaranty idea has been and still is very popular in the agricultural sections of the country. One chief reason for this is that the farmer, in times of prosperity, is not, as is the merchant and manufacturer, both borrower and depositor, but seeks first a place of safety for his surplus cash. The past ten years have been ex-

tremely prosperous for the farmers, who are seeking above all else safety for their bank deposits. It is still too early to pass any conclusive judgment on the plans in operation.

See NATIONAL BANKS, STATE BANKS, LOAN AND TRUST COMPANIES, SAVINGS BANKS, CENTRAL BANK CURRENCY, AND FINANCIAL REVIEW.

BAPTISTS. A religious denomination which received its name in 1644 from the designation applied to certain congregations of English Separatists, by whom the ancient practice of immersion had been recently restored. The denomination was founded in the United States by Roger Williams, who, about the middle of the seventeenth century, established the first congregation in the United States at Providence, R. I. There are fourteen divisions of the denomination in the United States, but the so-called "regular Baptists," North, South, and colored, differ only in organization, having no doctrinal distinctions. The total membership of these bodies is given by the *American Baptist Year Book* for 1909 as 5,115,177, comprising the greater number of communicants of the Baptist churches. The membership of the Baptist bodies of North America is estimated by the same authority in 1909 at 5,293,170, ranking third among the religious denominations of the United States. The designation and number of communicants of the various bodies are as follows: Regular Baptists, 5,115,177; Free Will Baptists, 78,771; General Baptists, 32,250; German Baptists, 122,332; Primitive Baptists, 126,000; Seventh Day Baptists, 8366; other Baptist bodies, seven in number, 62,024. There were in the regular Baptist denomination in 1909 48,302 churches, 34,132 ordained ministers, and in the Sunday schools were 2,386,300 scholars and 235,156 officers and teachers. The value of the church property was \$125,214,085. The total contributions from all sources during the year was \$22,813,864. Of this amount, \$17,504,444 were for church expenses; \$832,090 for Sunday school expenses; \$819,692 for city missions; \$705,628 for home missions; \$865,585 for foreign missions; \$84,806 for Bible and publication work; \$323,503 for education, and \$1,512,744 for miscellaneous. Missions are carried on by the church in Burma, Assam, South India, China, Japan, Africa, the Philippine Islands and in Europe. There are under the missions of the church in Europe 1143 churches, 1410 preachers, 135,566 communicants, and 2365 Sunday schools with a membership of 113,825. In missions in heathen lands there are 1322 churches, 331 ordained preachers, 143,873 members, and 1531 Sunday schools, with a membership of 53,917. The missions of the church are under the conduct of the American Baptist Missionary Union and the American Baptist Home Missionary Union. The Southern Baptist Convention, which is the organization of the Southern Baptists, maintains missions in South America, in Italy, Africa, China, and Japan. The denomination has organized bodies in each of the States of the Union for the carrying on of missionary, educational and other work. Among other organizations of the church, whose titles sufficiently indicate their purpose, are the American Baptist Publication Society, the American Baptist Home Missionary Society, and the Woman's Baptist Foreign Missionary Society. The German Baptist Conference has

general charge of work among the Germans and the Swedish Baptist Conference has charge of the work among the Swedes of the Northwest. The denomination maintains ten theological seminaries, which in 1909 had 1303 students, with 112 instructors. The universities and colleges under the auspices of the denomination numbered 94, with an attendance in 1909 of 35,281, of whom 17,948 were males and 17,193 were females. In these institutions were 2232 instructors. Their endowments amounted to \$28,212,869. In addition, there are 84 other institutions, including academies, institutes and trade schools. These are found in all parts of the country.

The most important event in the history of the church in recent years was the founding in 1907 of the Northern Baptist Convention as the culmination of a movement which was designed to strengthen denominational unity and efficiency among Baptists throughout the North. At its first meeting a constitution was provisionally adopted and this was referred to the churches for ratification. This constitution was formally adopted by the Convention held in 1908. The object of the Convention is to combine in some organic order all the self-perpetuating and more or less independent societies through which the missionary activities of the church have hitherto been carried on and to affiliate this body with the Convention itself. A joint committee of the Convention and the societies was appointed to report at the meeting in 1909 the particular form which this affiliation was to take. This meeting was held in Portland, Oregon, on June 24. A finance committee, which had been appointed the previous year, reported remarkable success in the budget campaign carried on by the Convention. The societies which closed in the year 1908 with a debt of \$286,000 began the year 1909 without debt. The Convention was called upon to consider combination of these societies, which should at the same time maintain their charter rights and give a more denominational support and direction to their operations. Certain legal and other objections made it impossible to bring about this consolidation in 1909, but steps were taken to make a completion of the policy probable in 1910. The Convention received the reports of committees on social service and on city missions, which showed that great progress had been made during the year toward grappling with the great social questions which the churches face. The annual meeting of the Southern Baptist Convention was held at Louisville, Ky., on March 13, 1909.

BAPTISTS, FREE, sometimes called FREE WILL BAPTISTS. A religious body founded in 1780 by Benjamin Randall, who established a church in New Durham, N. H., after he had left the regular Baptists because of his disbelief in the doctrine of election. The doctrine and practice of the church correspond practically to those of the General Baptists of England. The denomination is strongest in New England, but has a considerable strength in the West. In 1909 it had a membership of approximately 75,000, with 1500 churches and 1250 ministers. During the year \$64,000 was raised for foreign and home missions. A plan has been on foot for several years to bring about a plan of union for the missionary work of the Free Baptists and the Baptists. This has been agreed upon by nearly all of the State Asso-

ciations. The Free Baptists maintain several colleges, among them Bates College at Lewiston, Me.; Rio Grande College at Rio Grande, O.; Storer College at Harper's Ferry, W. Va.; Parker College at Winnebago, Minn., and Hillsdale College at Hillsdale, Mich. A Theological Seminary is maintained in connection with this institution, and Keuka College at Keuka Park, N. Y., is maintained in connection with the Disciples. The *Morning Star*, edited by George F. Mosher, LL.D., is published at Boston, Mass. Rev. H. M. Ford, D.D., of Hillsdale, Mich., is the Corresponding Secretary of the General Conference.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA. A union of all the young people's societies in Baptist churches in the United States and Canada for the purpose of carrying on educational work, designed to train young people for efficiency in Christian work. The union was organized in Chicago in 1891. Its headquarters are in Philadelphia and Chicago. It has two monthly magazines, *Service* for the senior department, and *Our Junior* for the junior department. These two organs are now published by the American Baptist Publication Society in Philadelphia. In 1909 there were estimated to be 600,000 members of the organization. It is international in its scope, including all the provinces of Canada as well as the United States. The Rev. George T. Webb, 1703 Chestnut Street, Philadelphia, is the General Secretary.

BAR ASSOCIATION, AMERICAN. An organization of the leading lawyers of the State, founded in 1878. It meets annually for the purpose of discussing matters of interest to the profession. The object of the Association, as stated in the constitution, is to advance the science of jurisprudence; promote the administration of justice and uniformity of legislation throughout the Union; to uphold the honorable profession of the law, and encourage cordial intercourse among the members of the American Bar. Its membership in 1909 was about 3500 and the attendance at the annual meetings averages from 300 to 400. The thirty-second annual meeting was held at Detroit, Mich., in August, 1909. The retiring president, Frederick W. Lehmann, delivered his address upon the subject of "The Most Noteworthy Changes in the Statute Law During the Past Year." Mr. Georges Barbey, Paris, France, delivered an address upon "The French Family Law"; Judge Julian W. Mack of Chicago read a paper on "Juvenile Courts"; Judge William L. Carpenter of Detroit read a paper upon "Courts of Last Resort," and Governor Augustus E. Willson delivered an address upon "The People and Their Law." A special committee of fifteen, appointed to formulate methods to prevent delays and reduce cost of litigation, submitted its report and was directed to urge upon Congress the passage of certain laws aimed at reducing the number of appeals and also limiting the cost of litigation. Various other committee reports were also read. The officers in 1909 were: President, Charles F. Libby, Portland, Me.; Secretary, George Whitelock, Baltimore, Md.; Assistant Secretary, Albert C. Ritchie, Baltimore, Md.; Treasurer, Frederick E. Wadham, Albany, N. Y. The executive committee consists of the president, the secretary, the treasurer, the retiring presi-

dent, Frederick W. Lehmann of St. Louis, and William O. Hart of New Orleans, Charles Henry Butler of New York, Ralph W. Breckenridge of Omaha, Lynn Helm of Los Angeles and John Hinkley of Baltimore.

BARBADOS. The most easterly of the West Indian islands, constituting a British colony. Area, 166 square miles. Estimated population (1908), 194,477. The capital is Bridgetown, with about 35,000 inhabitants. In 1907 there were 165 primary schools, with an average attendance of 15,286 pupils, and several higher schools. The staple products are sugar and cotton; these, with molasses and rum, form the principal exports. The chief imports are rice, salted meat and fish, grain, flour, and textiles. In 1907-8 and 1908-9, imports were £1,271,530 and £1,225,870 respectively; exports, £935,256 and £948,178; revenue, £209,818 and £189,805; public debt, £404,900 and £410,900. There are 470 miles of roads and 28 miles of railway. The Governor in 1909 was Sir Gilbert Thomas Carter.

BARBER, AMZI LORENZO. An American capitalist, died April 18, 1909. He was born at Saxton's River, Vt., in 1848. Removing to Ohio, he graduated from Oberlin College in 1867. He taught for a time at Columbian University, and became professor of natural philosophy at that institution, remaining until 1872. He then went to New York City and in 1876 graduated at the Columbia University law school. Previous to this time, Mr. Barber, with Senator John Sherman, became profitably interested in real estate in Washington. It was proposed in 1876 to repave the streets of the capital, and a new material, asphaltum, was selected. Mr. Barber made himself thoroughly conversant with the manufacture of asphalt, and giving up his real estate enterprises, went into business as a paving contractor in 1878. In 1883 he incorporated the Barber Asphalt Paving Company. This company, after much litigation, secured control of the asphaltum lake in the island of Trinidad, then the most available source of supply. Mr. Barber, in 1898, formed the first of a series of asphalt combinations, called the Asphalt Co. of America. This company was in 1900 absorbed by the National Asphalt Co., which was unsuccessful, and from which Mr. Barber withdrew in 1901. In 1904 he started the A. L. Barber Asphalt Co., which became the rival of the reorganized National Asphalt Co. The latter owned, not only the Trinidad deposits, but the valuable lake in Bermudez, Venezuela. The attempts of Mr. Barber's company to wrest this lake from the possession of its rival, resulted in conditions which kept Venezuela almost in a state of civil war for years, and resulted in the retirement of two United States Ministers to Venezuela. These matters are a part of the political and diplomatic history of Venezuela and the United States from 1904 to 1908. Mr. Barber was one of the first manufacturers of automobiles in the United States, and was also active in real estate dealings around New York City.

BARCLAY, CHARLES JAMES. A rear-admiral (retired) of the United States Navy, died September 26, 1909. He was born in Philadelphia in 1843, and was appointed to the United States Naval Academy in 1860. He graduated in 1863 and went immediately into active service. He served in Southern waters during the

Civil War, and after its close was for several years at sea as a junior officer. In 1874 he was given command of the ironclad *Saugus*. For thirty-one years thereafter he commanded ships, important departments and stations. He was a well-known authority on torpedoes, gunnery and ordnance. From 1882 to 1891 he was ordnance officer for several vessels, and engaged in conducting experiments at the Portsmouth Navy Yard, where he was equipment officer from 1891 to 1893. In 1897 he was given command of the *Raleigh*, but in a few months was placed at the head of a new school for seamen gunners. He was commandant of the Naval War College in 1900, and commandant of the Puget Sound Navy Yard 1903-5. He was made a rear-admiral in 1903, and retired in September, 1905.

BARLEY. The barley crop had a very favorable season in 1909, being especially benefited by the good weather setting in with the beginning of May. The earliness of the crop enabled it to escape the drought of July and August. Owing to these favorable conditions a good yield was secured, especially in California and the northwestern spring wheat States. In California, where barley is now largely grown on former wheat lands, the acreage is at present nearly double that of wheat. The area devoted to barley in this country recently has been increasing from year to year and part of this increase has taken place in the spring wheat region, where the crop fits well into rotations followed. The year 1909 leads all others in acreage, the area being 7,011,000 acres, as compared with 6,646,000 acres in 1908. The total production of 170,284,000 bushels stands second only to the yield of 1908, when 178,916,484 bushels were produced. The production of 1909 was greater by 3,528,000 bushels than that of 1908 and the average yield per acre for the two years was 24.3 and 25.1 bushels respectively. The following table shows the acreage, yield and value of barley in the principal barley-growing States for 1909:

States	Acreage	Production	Value	States	Acreage	Production	Value
	Acres	Bushels	Dollars		A	B	D
Minn.	1,359,000	31,600,000	14,852,000	Iowa.	465,000	10,800,000	5,009,000
Cal.	1,180,000	31,270,000	25,140,000	Wash.	182,000	7,189,000	4,601,000
Wis.	866,000	24,248,000	15,570,000	Kansas.	270,000	4,860,000	2,576,000
N. D.	987,000	20,727,000	8,915,000	Nebr.	120,000	2,640,000	1,185,000
S. D.	1,021,000	19,910,000	8,960,000	Idaho.	62,000	2,480,000	1,463,000

The average yield per acre in these States varied from 18 bushels for Kansas to 40 bushels for Idaho. Only three other States or Territories, New Mexico, Arizona, and Utah, reached an average production of 40 bushels per acre.

The world's total production of barley for 1909 is estimated by the Hungarian Ministry of Agriculture at 1,600,584,000 bushels or 334,000,000 bushels more than last year. The European barley crop of this year was generally quite satisfactory. In Great Britain the acreage was somewhat reduced, but the yield was estimated at about 3 per cent. better than the average. France produced a crop ranking above the five-year average, while in Germany the yield was a little below normal. The barley production of European and Asiatic Russia for

this year is estimated at over 400,000,000 bushels. Canada produced an average yield of 30.55 bushels per acre and a total crop amounting to about 55,000,000 bushels, this being about 6,000,000 bushels more than the year before.

While barley improvement is receiving attention in the United States, the results secured along this line are much less marked than the results of barley improvement in Europe, where special attention is given to bettering the brewing or malting quality. European brewers and investigators consider the relations between starch and extract content; protein content and starch and extract content; protein content and 1000-kernel weight; and the 1000-kernel weight and the percentage of hull as highly important in judging barley. Experiments carried on in Europe have shown that the proportion of hull and the structure of the hulls apparently bear no relation to the protein content of the grain.

BAROTSELAND. See RHODESIA and BRITISH SOUTH AFRICA.

BARROWS, SAMUEL JUNE. An American philanthropist and penologist, died April 21, 1909. He was born in New York City in 1845. His only formal early education was in the primary schools, as he earned his own living in a machine shop while he was still a boy. He became afterwards a stenographer and reporter. In 1867 he was stenographic secretary to W. H. Seward, then Secretary of State. He studied theology at the Harvard Divinity School, graduating in 1875. After further study at Leipzig he became, in 1876, pastor of the First Church (Unitarian) of Dorchester, Mass. He remained in this pastorate until 1881, when he became editor of the *Christian Register*. He resigned this position in 1897 on his election to Congress, where he served one term. In 1896 he represented the United States on the International Prison Commission. Mr. Barrows was one of the chief penological autho-

ties in the United States. He was one of the founders of the Massachusetts Prison Association; a member of the International Society of Comparative Criminal Law, and from 1900, corresponding secretary of the Prison Association of New York. He wrote *Shagbacks in Camp; Isles and Shrines of Greece; Crimes and Misdemeanors in the United States*, and many reports dealing with penology.

BARTH, THEODOR. A German politician and publicist, died June 2, 1909. He was born at Duderstadt in 1849 and studied at the Gymnasium Audrianum in Hildesheim. He spent three years in the study of law at the universities of Heidelberg, Leipzig, and Berlin, receiving the degree of J. U. D. at the University of Leipzig. In 1871-2 he practiced law in Bremen, from 1872 to 1876 held the office of

Magistrate in Bremerhaven, and from 1876 to 1883 was Secretary of the Chamber of Commerce. While filling the latter office he became an ardent advocate of free trade, and promulgated its principles and applications in a series of publications. When Bismarck reversed the policy of the government in this matter, Barth became one of his most effective and determined adversaries. In 1881 he entered the Reichstag from Gotha and in that body took his place among the members of the Liberal Union. In 1883 with Louis Bamberger, the advocate of economic freedom, he founded *Die Nation*, a weekly paper, and continued its editorship until 1907, when its publication ceased. For twenty years this journal was one of the most powerful influences in Germany among the political press. In 1885 Barth was again elected to the Reichstag as a German Liberal and sat in that body until 1898, and again from 1901 to 1903. He was also a member of the Prussian Landtag from 1898 to 1903. Throughout his career he was an energetic spokesman of Liberalism. His powers of oratory were great and in debate he was a formidable adversary. His antagonism to the Junkers, whose economic principles he detested, was particularly sharp and virile. Electoral reform in Prussia and the abolition of the present system received his staunch support. He met with bitter hostility on the part of the Agrarians, and it was particularly due to this, aided by unscrupulous election methods, that he lost his seat in the Reichstag. He was among those who in 1903 endeavored to bring about an alliance of all the Liberal elements against the common enemy, and he was in favor of enlisting the coöperation of the Socialists. This lost him many of his political friends in the National Liberal party. Barth always opposed steadfastly any reactionary movement and the progressive element suffered keenly from his death. A crisis was reached in 1898, when at a congress of the Liberal Union he and about twenty of the more radical members separated finally from the party, holding that the "bloc" was a hindrance to Liberalism. The new group thus formed aimed at representing the democratic tendency in uniting with the Socialists against reaction, holding that reaction was the most dangerous political menace of the times. Barth visited the United States several times, his last visit being in 1907. His writings on America include *Amerikanisches Wirtschaftsleben* (1887); and *Amerikanische Eindrücke* (1896). His other writings were chiefly contributions to his own paper and other reviews.

BARTLETT, FRANKLIN. An American lawyer, died April 23, 1909. He was born in Grafton, Mass., in 1847, graduated from the Brooklyn Polytechnic Institute in 1865, and from Harvard University in 1869, and studied law at Columbia University. He studied also at Oxford University. He began the practice of law in New York City, and within a few years became eminent in his profession. He was chief counsel in many famous cases. He took an early interest in military affairs, and in 1896 became colonel of the Twenty-second Regiment of the National Guard of New York, retaining that position until his death. He was elected to the Fifty-third and Fifty-fourth Congresses as a Democrat, but he refused to support the doctrines of W. J. Bryan.

He was a member of the constitutional convention of 1890, and took a prominent part in its proceedings.

BASEBALL. For the first time since 1903 Pittsburg last year won the National League championship, with 110 victories and 42 defeats. Chicago was second, with 104 games won and 49 lost, and New York third, with 92 games won and 61 lost. The other teams in the National League finished as follows: Cincinnati won 77, lost 76; Philadelphia won 74, lost 79; Brooklyn won 55, lost 98; St. Louis won 54, lost 98, and Boston won 45, lost 108. Detroit for the third successive year carried off the championship in the American League, winning 98 games and losing 54. The race in the American League was much closer than that in the National, owing to the unlooked for strength shown by the Philadelphia and Boston teams, which finished second and third respectively. Philadelphia won 95 games and lost 58, while Boston won 88 and lost 63. The standing of the other American League clubs was: Chicago won 78, lost 74; New York won 74, lost 77; Cleveland won 71, lost 82; St. Louis won 61, lost 89, and Washington won 42 and lost 110. The showing of the Washington team was the poorest ever made by a major league club. The series for the world's championship played between Pittsburg and Detroit was won by the National League champions, although the full quota of seven games had to be played before the contest was finally decided. The attendance at these games (145,295) and the receipts (\$188,302) broke all former records. The score of the championship games follows: Pittsburg 4, Detroit 1; Detroit 7, Pittsburg 2; Pittsburg 8, Detroit 6; Detroit 5, Pittsburg 0; Pittsburg 8, Detroit 4; Detroit 5, Pittsburg 4, and Pittsburg 8, Detroit 0. The victory of Pittsburg was in large measure due to the pitching of Adams, a newcomer in the league, who, because of the lack of condition of the older pitchers, had to be worked often. He showed himself equal to the task despite his inexperience, winning three of Pittsburg's four victories. The batting averages of the series were: Pittsburg .221, Detroit .235; and the fielding averages: Pittsburg .947, Detroit .937. The best individual batting averages were those of Delehanty (Detroit) .346, and Wagner (Pittsburg) .333. The total attendance at the major league contests was 7,978,108, the largest in the history of the game. The American League drew 3,740,570 persons and the National 3,637,538. Philadelphia in the American and New York in the National were the cities in which the greatest number of spectators gathered. The champion batter in the American League was Cobb of Detroit, who made 216 hits out of 573 times at bat, which gave him the high average of .377. Wagner of Pittsburg was again the leading batsman of the National League. He made 168 hits out of 495 times at bat, having an average of .339. Catcher Gibson of the Pittsburg Club established a new record in 1909 by taking part in 135 games, 134 of which were consecutive. The leading pitchers in the National League were Camnitz of Pittsburg and Mathewson of New York, each of whom won 25 games and lost 6. The most successful American League pitcher was Mullin of Detroit, who won 29 games and lost 8.

The first unassisted triple play ever made

In the major leagues was made by Ball, the Cleveland shortstop, on July 19 at Cleveland. The pennant winners in the principal minor leagues in 1909 were: American Association, Louisville; Eastern League, Rochester; Southern League, Atlanta; Western League, Des Moines; Tri-State League, Lancaster; Connecticut League, Hartford.

Among the college baseball teams the University of Pennsylvania showed the most consistent form, winning 21 of the important games scheduled and losing 4. The prominent teams defeated by Pennsylvania included Yale, Princeton, Georgetown, and Lafayette. No game was arranged with Harvard, but the latter by losing its series with Yale lost all claim to being regarded as a first-class team. Of the other Eastern nines Princeton and Yale deserve special mention, the former winning 20 games and losing 10, and the latter winning 19 and losing 10. The college teams which made the best record for the season, although few teams of high class were met, was Michigan, which won 19 games and lost 3. Chicago in the West also made a good showing. The scores in Pennsylvania's most important games were: Pennsylvania 4, Georgetown 2; Pennsylvania 6, Georgetown 7; Pennsylvania 3, Georgetown 1; Pennsylvania 2, Yale 0; Pennsylvania 4, Princeton 3; Pennsylvania 4, Princeton 3; Pennsylvania 4, Lafayette 0; Pennsylvania 0, Cornell 1; Pennsylvania 7, Amherst 1; Pennsylvania 3, Amherst 8; Pennsylvania 0, Holy Cross 11; Pennsylvania 2, Holy Cross 1. Yale's principal games were: Yale 0, Georgetown 2; Yale 4, Virginia 2; Yale 2, Harvard 3; Yale 4, Harvard 0; Yale 5, Harvard 2; Yale 6, Princeton 0; Yale 2, Princeton 3; Yale 5, Princeton 2; Yale 0, Pennsylvania 2; Yale 0, Amherst 4; Yale 4, Cornell 3; Yale 2, Brown 4; Yale 4, Brown 1; Yale 3, Fordham 2. Princeton defeated Georgetown 5 to 4; Brown 3 to 2 and 3 to 2; Virginia 3 to 0; Dartmouth 6 to 5; Amherst 2 to 1, and Yale 3 to 2. Princeton lost to Georgetown 3 to 8; to Fordham 0 to 2; to Virginia 3 to 4; to Pennsylvania 3 to 4 and again 3 to 4; to Harvard 0 to 6 and 1 to 4, and to Yale 0 to 6 and 2 to 5.

BASKERVILLE, H. C. An American teacher, killed at Tabriz, Persia, on March 31, 1909, while leading an attack against the tribes besieging the city. He graduated from Princeton University in 1907, and accepted a position as teacher in the boys' school maintained in connection with the Presbyterian Mission at Tabriz. He became interested in the political situation in Persia, and, resigning his position, openly allied himself with the revolutionary movement. In the defense of the city against the troops of the Shah (see PERSIA, paragraph on *History*) Baskerville took a leading part. He repeatedly urged a sortie, but was unable to gain the help of the citizen troops until the time for such a movement had passed. Then, against his own judgment, he led a body of 150 men, which dwindled to nine, against the besiegers. He was shot through the heart at the head of his followers.

BASKETBALL. The basketball season of 1909 had an unsatisfactory ending in that it was impossible to arrange a series of games to decide the national championship among the colleges. Of the Eastern institutions Columbia

made a fine showing, losing only one game during the season. Pennsylvania, the only team to defeat Columbia, was ranked second by the experts. The team representing Yale, Harvard and Princeton played very poorly. Other Eastern colleges which were not members of the Eastern Collegiate League, but which had an excellent record, were New York University, the College of the City of New York, and Williams. New York University went through the season without defeat, and by some experts was rated an even better team than Columbia. Williams made a splendid showing by winning the New England championship. Among the Western colleges Chicago again showed superiority, winning twelve games and losing none. Wisconsin ranked second and Purdue third. Georgetown secured the highest rating of the Southern colleges.

Outside college circles basketball was played by hundreds of Y. M. C. A. branches throughout the United States. The best professional team was undoubtedly that captained by Hans Wagner, the Pittsburg baseball star.

The most important change made in the rules last year was that in reference to "dribbling," which term was formerly applied to the motion of the player, but which is now applied to the motion of the ball. A "dribble" is now legal only as long as the ball is kept in motion.

BASSERMAN, HEINRICH. A German theologian, died in August, 1909. He was born at Frankfort-on-the-Main and studied at the universities of Jena, Zurich and Heidelberg. He was appointed in 1880 professor of theology at the University of Heidelberg. He was a profound scholar and his writings were numerous. Among them were *Handbuch der geistlichen Beredsamkeit* (1885); *Akademische Predigten* (1886); *Sine Ira et Studio*; *Der Entwurf der neuen preussischen Agende beurteilt* (1894).

BASUTOLAND. An inland South African possession of Great Britain, bounded by Cape Colony, the Orange River Colony, and Natal. The area is stated at 10,293 square miles. Estimated population (1907), 351,000. Maseru, the capital and largest town, has about 13,000 inhabitants. There are about 250 schools, with about 12,000 pupils. The chief products are wool, wheat, mealies and Kaffir corn. The principal exports are grain, wool, cattle, and horses, and the principal imports, blankets, plows, iron and tinware, clothing and groceries. Imports and exports in 1907 were valued at £236,600 and £248,541 respectively, in 1908, £239,830 and £193,122 respectively. A railway of 16 miles connects Maseru with the Bloemfontein-Modderpoort line at Marseilles Station. Revenue and expenditure in 1907-8 amounted to £116,529 and £126,603 respectively; in 1908-9, £108,637 and £126,921 respectively. Basutoland is administered by a Resident Commissioner (Herbert Cecil Sloley in 1909) under the direction of the High Commissioner for South Africa, the latter possessing the legislative authority, which is exercised by proclamation.

HISTORY. Early in February a deputation of Basuto chiefs visited England to discuss the status of Basutoland if the Union of South Africa went into effect. They were received at the Colonial Office on February 9 and remained in England until the end of February. The mission arose from anxiety as to the future welfare of the Basutos in the event of Union.

The chiefs did not wish the Union at first, but finally seemed to be won over. On March 1 Lord Selbourne visited Maseru where he reviewed 20,000 native horsemen. In a speech which he made at the time he declared that the Basutos could not prevent their country from forming a part of the Union, but that they would in no wise suffer from the change, of which the chief objects would be to secure the country for them, to retain the national council and to suppress the drink evil. The South African constitution provides that the lands of the Basutos shall not be alienated.

BATES, ALFRED ELLIOTT. An American army officer, died October 13, 1909. He was born in Monroe, Michigan, in 1840 and received his early education in the public schools. He graduated from the United States Military Academy in 1865, and after some service in the west, became an instructor in that institution. He was in active service again in 1864 and was a member of the Big Horn Expedition. In 1875 he was appointed to the army staff as paymaster. In this position he served in Texas, Dakota, Washington, New York and San Francisco. From 1897 to 1899 he was military attaché at the Court of St. James, and afterward served in the same position in Paris. In 1899 he was made paymaster-general with the rank of brigadier-general and in 1904 was retired with the rank of major-general. In 1906 he was sent to San Francisco to investigate the accounting of the Red Cross funds and the government funds for the relief of fire sufferers.

BATTLESHIPS. The British all-big-gun-one-calibre battleship *Dreadnought*, completed in 1906, has been succeeded by improved *Dreadnoughts* of so much greater tonnage that the original vessel seems almost a pygmy. The *Dreadnought*, with her 10-12" guns, was so superior to all existing types, the standard of which generally mounted a main battery 4-12" guns, and an intermediate battery of from 12 to 14 6" guns, that the British boast. "The *Dreadnought* has made all previous battleships obsolete," might well be accepted as pardonable pride. Commencing in 1905, an animated discussion has been maintained throughout the naval world as to whether the main battery of a battleship should consist of heavy guns of one calibre, like that of the *Dreadnought*, or of a combination of two calibres, like that of the *Lord Nelson* (4-12"; 10-9.2" guns). The chief arguments of those in favor of one calibre were, and are: concentration of fire; simplicity of fire control, of training, of ammunition supply, of arrangement of magazines; increased speed. Their opponents declared that the Russo-Japanese war clearly demonstrated the value of the gun of medium calibre on account of its rapidity of fire combined with accuracy; to it was due the destruction of the superstructures and the unarmored ends of battleships, with the accompanying loss of life, and the demoralization of the remaining personnel. They also called attention to the great cost of *Dreadnoughts*; that it is not well to put all your eggs in one basket; that docking facilities were lacking. Even to-day, there are many thoughtful people in England who feel sure that a terrible blunder was made in building the *Dreadnought*, as all other nations have been compelled to follow suit, thereby lessening the possibility of any international agreement on the subject

of the reduction of armament. As an anti-torpedo-boat battery, the *Dreadnought* carried 24-3" guns. The increased effective range of the torpedo, greater offensive power of the later large destroyers, and the need of a gun for attacking unarmored ships, have led to the adoption of a heavier gun than the 3" for the anti-torpedo-boat battery. The later British *Dreadnoughts* carry 20-4" guns; while the American *Wyoming* is to carry 21-5" guns. The arrangement of the turrets on the *Dreadnought* has been abandoned in the latest British all-big-gun ships; the American plan of mounting all-great-gun turrets on the centre line has been adopted. The *Orion*, 22,500 tons, will carry 10-12" guns, all on the centre line, three turrets forward of the superstructure, and two aft. Compared with the earlier *Dreadnoughts* (excluding the *Neptune*), two guns have been sacrificed in both ahead and astern fire to secure two more guns on the broadside. The *Neptune*, the eighth and largest of the *Dreadnoughts* yet launched, carries her 10-12" guns in five turrets, three on the centre line, and one on each side, in echelon. All ten guns can be fired on either broadside, whereas her predecessors could only fire eight; the middle turret on the centre line will be raised and placed close forward on the after one, so that its guns can be fired over it, thus giving a stern fire of eight guns, instead of six. For a long time the British looked with suspicion on the American plan of having one turret fire over another. The arrangement of armor on British *Dreadnoughts* is still similar to that on the *Dreadnought*; on the *Vanguard*, *St. Vincent*, and *Collingwood*, the main armor belt was thinned, and spread over a greater area of the hull. The increased displacement of the later *Dreadnoughts* has been used to afford greater protection, a better disposition of the battery, greater speed, and to permit the mounting of a heavier anti-torpedo-boat battery. It looks as if the maximum displacement had not yet been reached; first, we have the *Dreadnought*, of 17,900 tons; then the *Bellerophon*, of 18,600 tons; then the *Vanguard*, of 19,250 tons; then the *Orion*, of 22,500 tons. The American *Wyoming* displaces 26,000 tons; and the British battleship cruiser *Lion*, 26,350 tons. Now a member of the United States House of Representatives proposes the building of a battleship of 30,000 tons. The increased tonnage is obtained chiefly by increasing the length and beam, increase of draft being comparatively small. The *Michigan*, 16,000 tons, has a mean draft of 24 ft. 6 in.; the *North Dakota*, 20,000 tons, 26 ft. 11 in.; the *Wyoming*, 26,000 tons, about 28 ft. 6 in. The *Michigan* is 450 ft. long on the load water line; the *North Dakota*, 510 ft.; the *Wyoming*, 550 ft. The *Michigan* has an extreme breadth at load water line of 80 ft. 2 $\frac{1}{2}$ in.; the *North Dakota*, 85 ft. 2 in.; the *Wyoming*, 93 ft. 2 $\frac{1}{2}$ in.

The naval Powers are making immense sacrifices in building *Dreadnoughts*. There are very few docks in the world that will take the latest type; and not many harbors they can safely enter. The cost to Germany will be enormous; the widening and deepening of the Kaiser Wilhelm canal will occupy many years, and will cost about eleven millions sterling; vast sums have already been expended in making Wilhelmshaven into a first class naval port; great sums must be spent in dredging rivers and harbors.

BATTLESHIPS

These later, larger *Dreadnoughts* can be completed more quickly than the smaller battleships of the pre-*Dreadnought* period. The building period has been shortened, in England, to two years.

There is also a tendency toward increasing the launching weight. That of the *Dreadnought* was 6000 tons. A little more than a year later, on July 27, 1907, that of the *Bellerophon* was 7000 tons, about 1000 tons more than that of the *Dreadnought*, although the difference in the displacement of the two ships is only 700 tons. The *Vanguard's* launching weight was, February 22, 1909, 10,250 tons; that of the *São Paulo*, April 19, 1909, 10,400 tons. In the United States, the launching weight of the *North Dakota* was 7000 tons; that of the *Delaware*, 8500 tons.

The 12" gun has been universally adopted for the main battery of battleships, even by Germany. Each turret contains two guns. The Supreme Council of the French Navy has recommended the triple turret.

DREADNOUGHT CRUISERS. These vessels are all-big-gun-one-calibre armored cruisers, able to lie in the line of battle; their great speed fits them for use as scouts, and for the protection of commerce; they will form the "flying wings" of a fleet. England led the way here, again, followed by Germany. The three English *Invincibles* are already in commission; the German *Von der Tann* was launched on March 20, 1909. Admiral Lord Charles Beresford, in election speeches at Portsmouth, during the first part of January, 1910, declared that the *Invincible* is a "complete breakdown," that she has never fired her 12" guns simply because she cannot; that, in case of war, her personnel would be transferred to a ship that could fight. The latest English armored cruiser laid down, the *Lion*, will have the same main battery as the original *Dreadnought*, with a very much heavier anti-torpedo-boat battery; she will have 6½ knots more speed; but the maximum thickness of her armor belt will be 2" less.

BAUSMAN, BENJAMIN. Pastor in the American German Reformed Church, died May 8, 1909. He was born in 1824, graduated at Marshall College in 1851, and from the Theological Seminary, Mercersburg, Pa., in 1852, and became pastor at Reading, Pa., in 1863. In 1873 he founded St. Paul's Reformed Church in Reading, and remained its pastor until his death. Dr. Bausman was prominent in the councils of the church, and in 1894 was president of the General Synod. He wrote, among other works, *Sinai and Zion* (1860); *Wayside Gleanings in Europe* (1878); *Bible Characters* (1893); *Precept and Practice* (1901). He also edited several periodicals connected with his denomination.

BAUXITE. See MINERAL PRODUCTION.

BECHUANALAND PROTECTORATE. A British possession in South Africa, lying between the Malapo and Zambezi rivers and extending from the Transvaal to German Southwest Africa. Area, about 275,000 square miles. Population, about 134,000, of whom 1100 are whites. Serawe, the chief town of the Bamangwato tribe, has about 17,000 inhabitants. The natives engage in cattle-raising and to some extent in agriculture. Exports are principally live-stock, hides, horns, etc. The railway and

^a Minas Geraes was to be turned over to the Brazilian government on January 6, 1910.

telegraph from Cape Colony to Rhodesia pass through the Protectorate. There are 12 post-offices. Revenue and expenditure in 1907-8 amounted to £31,563 and £75,851 respectively; in 1908-9 £42,050 and £75,800 respectively. The Protectorate is administered by a Resident Commissioner (Lt. Col. F. W. Panzera in 1909) under the direction of the High Commissioner for South Africa, the latter possessing the legislative power, which is exercised by proclamation. The natives continue under the immediate rule of the tribal chiefs.

BEER. See LIQUORS, FERMENTED and DISTILLED.

BEERNAERT, AUGUST MARIE FRANÇOIS. A Belgian publicist who shared with M. d'Estournelles de Constant (q. v.) the Nobel prize for peace in 1909. He was born in Ostend in 1829 and from 1874 has been active in Belgian politics. He has taken particular interest in the question of international arbitration and was a delegate of the Belgian government at the peace conference at The Hague. He was also a member of the permanent court of international arbitration. The reforms in the Belgian Congo are largely due to his efforts and in this connection he circulated a largely signed protest vindicating the administration of the colony under the present Belgian government. M. Beernaert has been for more than forty years the head of the powerful Catholic party in the Belgian Parliament. It was announced that he had decided to consecrate the \$25,000 which was awarded him as the Nobel prize for peace to the reception for Parliamentary strangers at Brussels in 1910, and the surplus to the propaganda of pacifism.

BEET SUGAR. See SUGAR.

BELGIAN CONGO. See CONGO, BELGIAN.

BELGIUM. A constitutional monarchy of western Europe, capital, Brussels.

AREA AND POPULATION. Area, 11,373 square miles. Population (1900), 6,693,548; estimated December 31, 1907, 7,317,561; December 31, 1908, 7,386,444. The number of marriages in 1906 was 58,388; births (living), 186,271; deaths, 118,884. The immigration and emigration in 1907 were 38,921 and 32,350 respectively, against 37,382 and 32,858 in 1906. According to the estimate of December 31, 1907, Brussels had, with the suburbs, 629,917 inhabitants; Antwerp, 310,903; Liège, 173,939; Ghent, 164,117.

EDUCATION. Primary education is compulsory. Education is largely under clerical control, which is a great source of grievance to Liberals and Socialists. The state maintains a graded educational system. For 1907 public schools were reported as follows: Infant, 2837, with 264,845 pupils; primary, 7222, with 883,518 pupils; middle-class, male and female, 88 and 40 respectively, with 17,942 and 8045 pupils respectively; primary normal, 54, with 4913 pupils; middle-class normal, 4, with 196 pupils; adult schools, 4218, with 208,656 pupils; royal colleges and athénées, 35, with 7693 students. Besides the public schools there are many elementary and secondary schools, mostly controlled by the Church, and commercial industrial schools, etc.

Of Belgium's four universities, Ghent and Liège are state, Brussels free, and Louvain church; with various attached special schools, they have more than 6000 students. Illiteracy is decreasing. In 1880, 33.2 per cent. of the population above seven years could neither read nor write; in 1900, 22.1 per cent. In 1907, 9.06 per cent. of the military recruits were illiterate. Roman Catholicism is the state religion, but full religious liberty prevails, and grants are made from the national treasury to all denominations.

AGRICULTURE. Of the total area, 1,736,174

hectares are under cultivation and 521,495 under forests. The following table shows the acreage for 1906 and yield for 1905 and 1906 of the following crops:

	Acres, 1906	Quintals, 1905	Quintals, 1906
Oats	261,224	4,903,985	6,564,840
Rye	252,909	5,422,904	5,224,696
Wheat	160,073	3,374,970	3,528,088
Barley (winter).....	29,082	897,126	807,385
Beets (sugar).....	55,751	21,013,336	17,489,228
Beets (other).....	61,307	35,224,114	34,155,029
Potatoes	144,881	15,556,119	24,127,000
Tobacco	2,909	75,506	68,044
Hops	2,397	51,172	34,948

The live-stock numbered, December 31, 1906, 1,779,678 cattle, 244,893 horses, and 1,148,083 swine. The annual value of the total forest products is estimated at 21,653,482 francs. The number of people engaged in agriculture was given (1900) at 449,902.

MINING AND METALS. The output of the coal mines is given as follows: 1906, 23,569,000 tons; 1907, 23,830,289; 1908, 23,635,174; first six months of 1909, 11,559,745 tons, against 11,813,648 tons for the corresponding period in 1908. The number of miners employed was 139,394 in 1906; 141,966 in 1907; 143,947 in 1908. The number of coal mines in operation in 1906 was 122. General recognition of the fact that the present Belgian coal district is being worked out has given added significance to the discovery of deposits in the Campine district (provinces of Limburg and Antwerp). The first shaft has been sunk by a French company, at Beiringen. Iron ore (reported, 1907, 316,250 tons; 1906, 232,570), zinc, lead, and copper are mined. Out of 41 blast furnaces, only 33 were in active operation in March, 1909. The furnace products in 1906 were as follows:

	Tons.	Francs.
Pig iron.....	1,363,075	97,409,000
Manufactured iron.....	358,250	53,303,000
Steel ingots	1,395,140	133,110,000
Steel rails, etc.....	1,164,745	169,046,000
Zinc		98,616,000
Lead		10,207,000
Silver from lead.....		21,081,000

There were 1680 quarries in operation in 1906, employing 37,927 workmen. The value of the output of the year was 62,274,570 francs.

OTHER INDUSTRIES. Belgium is essentially a manufacturing country, and for its food supplies is largely dependent upon foreign sources. Besides the furnace products, the leading manufactures are glass, textiles, lace, sugar, flour, and starch, and distillery and brewery products. In 1906 there were 99 sugar mills, with an output of 277,814 tons of raw sugar; 24 sugar refineries, output 124,515 tons; 137 distilleries, output 63,650 hectolitres of alcohol at 50° G. L. The cotton industry in 1908 employed 1,162,041 spindles. The lace makers number about 45,500. The fishing industry is reported to be declining. In 1906 the value of the catch was 6,592,087 francs.

COMMERCE. The special and transit trade for three successive years is given in thousands of francs as follows:

	1906	1907	1908
Imports	\$3,454,000	\$3,773,600	\$3,327,400
Exports	2,793,800	2,848,100	2,506,400
Transit	2,268,800	2,348,000	2,021,000

The figures for the first nine months of 1909 show an improvement of 7.4 per cent. for imports and 2.5 per cent. for exports over the corresponding period in 1908, the imports for consumption amounting to 2,517,804,650 francs, and exports of domestic products, 1,875,298,000 francs. The principal articles of special trade for 1908 were valued as follows:

	Exports
Machinery and vehicles	206,700,000
Cereals and flour	199,400,000
Iron and steel	197,300,000
Skins	123,300,000
Woolens	82,600,000
Flax	82,100,000
Crude oil	81,300,000
Spun flax	77,700,000
Zinc	74,100,000
Seeds	70,700,000
Glassware	68,900,000
Chemicals	57,700,000
Cotton textiles	54,900,000
Resins and bitumens	48,600,000
Manure	46,600,000
Stone	45,600,000
Sugar	38,200,000
Animal fats	37,500,000
Dyes and colors	36,900,000
Woolen yarns	36,100,000
Drugs	35,900,000
Live-stock	32,200,000
Diamonds, cut	23,900,000

	Imports
Cereals and flour	558,500,000
Resins and bitumens	164,200,000
Wool, raw	163,600,000
Timber	663,200,000
Skins	138,900,000
Seeds	120,400,000
Chemicals	108,300,000
Crude oil	92,500,000
Iron and steel	83,600,000
Machinery and vehicles	76,600,000
Dyes and colors	70,600,000
Rubber	67,300,000
Coffee	65,200,000
Flax, raw	62,000,000
Live-stock	55,600,000
Cotton, raw	51,500,000
Drugs	48,800,000
Animal fats	41,800,000
Cotton textiles	33,700,000
Dairy products and margarine	33,000,000
Wines	28,400,000
Diamonds	23,300,000

The principal countries of origin and destination of the special trade for 1908 (exclusive of precious metals) and the value of their trade in francs are given as follows:

Countries.	Imports.	Exports.
France	516,700,000	464,800,000
Germany	449,900,000	680,300,000
Great Britain.....	375,800,000	334,300,000
United States.....	341,500,000	73,000,000
Argentina	311,000,000	59,600,000
Russia	203,000,000	38,200,000
Rumania	114,300,000	11,800,000
British India.....	96,100,000	28,500,000
Australia	73,600,000	16,400,000
Chile	68,600,000	30,500,000
Belgian Congo.....	53,300,000	16,300,000

COMMUNICATIONS. The total length of railways at the end of 1908 was 2888 miles, including branch lines and private lines rented

by the state; railway operated by the state in 1906 2540 miles, by companies 332 miles. Passengers carried by state railways in 1906, 152,237,941; by company lines, 17,602,017; gross receipts (state), 259,336,992 francs and (companies) 32,422,669 francs; expenses (state) 166,150,884 and (companies) 13,904,778. The first cost of state railways at the end of 1906 amounted to 2,335,731,336 francs; net receipts, 2,379,949,967; financial charges, 2,074,525,984. Length of public roads (1907), 6000 miles; navigable rivers and canals, 1360 miles. Number of post-offices (1908), 1485; postal receipts for the year, 35,939,747 francs; expenses, 18,695,113. Length of telegraph lines in 1908, 4369 miles; number of offices, 1561; messages carried, 7,700,000. The merchant marine, January 1, 1909, had 88 steamers of 152,325 tons and 4 sailing vessels of 3038 tons. During 1908 10,256 vessels of 13,409,331 tons entered and 10,268 of 13,441,093 tons cleared at the various ports.

FINANCE. The unit of value is the franc, worth 19.3 cents. In 1906 the revenue and expenditure were 675,688,000 francs and 772,366,000 francs respectively. For 1909 the estimated revenue was 619,200,944 francs and 618,895,733 francs respectively. The principal items of revenue were: Railways, 264,200,000 francs; excise, 78,486,100; customs, 53,198,400; registration tax, etc., 36,000,000; property taxes, 28,632,000; personal taxes, 25,024,000; succession tax, 25,500,000; posts, telegraphs, and telephones, 36,823,000. The chief estimates of expenditure were: Public debt, 178,057,751 francs; railways, ports, and telegraphs, 218,971,628; public instruction, 33,789,377; army, 58,172,506; justice, 28,900,200. The total public debt, January 1, 1909, amounted to 3,436,917,851 francs.

BANKS. The National Bank, instituted in 1850, is the only bank of issue. Its capital and reserve aggregate 83,814,000 francs. On December 23, 1908, its cash on hand amounted to 160,607,000 francs, and its note circulation, 760,236,000 francs. At the end of 1906 the state savings banks had 2,419,710 deposits, aggregating 812,092,923 francs.

GOVERNMENT. The executive power is vested in the King. He is assisted by a ministry of ten members, appointed by himself and responsible to the lower house of the Parliament, which consists of the Senate (111 members, chosen partly directly and partly indirectly for eight years) and the Chamber of Representatives (166 members, chosen by direct vote for four years). The Ministry in 1909 was composed as follows: Premier, Minister of the Interior and of Agriculture, F. Schollaert; Justice, L. de Lantsheere; Foreign Affairs, J. Davignon; Finance, J. Liebaert; Sciences and Arts, Baron Descamps; Industry and Labor, A. Hubert; Public Works, A. Delbeke; Railways, Posts, and Telegraphs, G. Helleputte; War, Lieutenant-General J. Hellebaut; Colonies, J. Renkin.

ARMY. Unlike most European countries Belgium does not require a large standing army, as its neutrality is satisfactorily guaranteed. Accordingly voluntary enlistment prevails, though if necessary recourse can be had by conscription. Thus enlistment is for a period of eight years in the ranks and four in the reserve, and was a part of the scheme of reorganization adopted in 1902. But the results

were not satisfactory and the criticism of the army, which was manifest in 1908, aroused further discussion in 1909. (See following paragraph under *History*.) The Belgian army consisted of 14 regiments of infantry each of 4 battalions of 4 companies and a depot, 1 regiment of grenadiers, 1 regiment of carabiniers (4 active battalions and 2 reserve), and 3 regiments of chasseurs-à-pied. The cavalry consists of 2 regiments of chasseurs, 2 of guides, and 4 of lancers, each of 4 squadrons and 1 reserve; and the artillery is made up of 4 field and 4 fortress regiments. The engineers are organized as a regiment of 3 battalions, with a reserve battalion and 5 special technical companies. In addition to a gendarmerie of over 1700 men there was a Civic or National Guard organized on a military basis, but under the Minister of the Interior, numbering approximately 45,000 actives and 100,000 non-actives, which would be available in war for lines of communication, etc. In 1909 the entire military establishment amounted to 3424 officers and 43,061 men, including some 2000 civilian employees. These figures were considered far from representing the actual strength of the army, which had been gradually diminishing, and some regiments were reduced below an effective training basis.

HISTORY

MILITARY REORGANIZATION. The law of 1902, though not changing the militia fundamentally, had made some important alterations, the chief of which was the reduction of the term of active service in the infantry to twenty months. As a result of this the peace effective decreased. In order to supplement it an attempt was made to encourage voluntary enlistment among those who had not been drafted under the existing system of drawing by lot. To attract volunteers high pay was offered and a promise was held out of engagement in public administration after their term expired. This was in line with the popular demand that no one should be forced to be a soldier. The law provided that in cantons where voluntary enlistment was sufficient drawing by lot might be suppressed, but owing to the general popular dislike of military service voluntary enlistment became more meagre than before and the gap caused by the reduction of the term of service was not filled. Thus at the beginning of the session the Minister of War declared that instead of the effective of 42,000 there were at present but 30,000 in the barracks, and the following plan was proposed in order to increase the defensive army: General military service (one son to each family and allowing substitution between brothers), but a further reduction of the term. This, as far as it went, conformed to the wishes of the Progressists and Socialists, who contended for the greater reduction of the term and the inclusion of all as liable for service, instead of the invidious method of choosing by lot. The Minister of War, however, did not go far enough to meet the demands of the extremists and it was thought he intended to keep the term of eighteen months. The friends of the volunteer system argued that it had not had a fair trial owing to the opposition of the military authorities. The government majority was weak and the Ministry was divided on the question, so no law was proposed, but a Commission of In-

ALBERT I

LEOPOLD II
King of the Belgians, died 1909

quiry was voted by the Chamber at the request of the government. The Commission reported on April 30 that the shortage on a peace footing was 4802 and on a war footing 18,844. The supporters of the present system argued as before that this shortage was due to the inefficient application of the law and to the hostility of the military officers. The reformers, on the other hand, were concerned less with the matter of shortage than with the adoption of measures looking to universal compulsory service for a shorter term.

The Ministry finally agreed on a compromise project which was submitted to the Chamber by the Premier, M. Schollaert. Drawing by lot was suppressed and service was obligatory on all of an age that qualified them for service in the militia, but subject to numerous exceptions, including the exemption of the clergy, missionaries and members of religious societies that imposed vows. The government was to have the right to reduce the term of active service so far as necessary to prevent the peace effective from exceeding a strength of 42,000. These proposals were coldly received. Some raised the objection that according to the constitution the law must fix each year the precise figure of the annual levy. The number 42,000 was a larger peace effective than before and encountered the objections of the antimilitarists. The Socialists and Radicals wishing an "armed nation" on the Swiss model, with only a brief term of active service, were also opposed, believing that in the absence of any real military necessity, the actual purpose of such an establishment was to deal with internal difficulties, labor troubles and the like. Amendments were offered which virtually nullified the government's measure. These provided that in accordance with the constitution the number of the annual levy must be fixed each year by law, that drawing by lot should be restored if the contingent fell below a minimum figure, and that it was not obligatory to keep the number on a peace footing at 42,000. Such was the situation when Parliament adjourned for the summer vacation. It met on October 22, three weeks in advance of the usual date for the beginning of the autumn session, to debate the question. Clauses fixing the peace strength at 42,800 and providing for personal service (one son in a family) were enacted, and finally on December 1 passed the Chamber by 104 to 49. It was then debated in the Senate.

A special credit of nearly \$2000 for the fortifications of Antwerp was voted by the Chamber in June.

CONGO QUESTION. After the completion of the annexation in November, 1908, the most important matter that came up was the voting of the colonial budget which revealed a considerable excess of charges. The system of forced labor, which had been the subject of so much criticism in recent years, was continued and a decree of the government issued a short time before placed the number to be recruited in 1909 at 2500 for the building of the Great Lakes Railway. The Ministry replied to an interpellation on this subject, that it was impossible at present to give up the forced conscription of laborers. In fact a larger number was needed this year than before. So the Ministry promised to encourage free labor and voluntary employment, but could make no definite state-

ment as to when forced labor could be dispensed with. The United States and Great Britain formally refused to recognize and approve the transfer of Congo sovereignty to Belgium until radical reforms were made. In certain quarters there was a tendency in Belgium to make light of these protests as unlikely to be seriously pressed. One of the deputies, who published his views on the subject, declared there had been significant instances recently of the power of accomplished facts as, for example, in the Far East, and that there was no occasion for alarm at this temporary refusal to recognize the transfer. He applauded the dilatory course of his government's diplomacy in the matter, the interchange of diplomatic notes having proceeded very slowly, several months in fact having passed before Belgium replied to the British Note. The only danger was that of arousing in Great Britain a desire for conquest in giving her an excuse to seize African territory. Early in September Prince Albert was reported to have been very unfavorably impressed by the condition of the natives in the course of his visit to the Congo. The Colonial Minister proposed the Congo Budget on December 28 and at the same time submitted the government's plans for reform. See CONGO, paragraphs on *History*.

PARLIAMENT. Among the measures that passed or were under discussion during the year the following may be mentioned: The Chamber passed a law extending to merchants and their employees the jurisdiction of the councils of *prudhommes* which had hitherto applied only to industrials, and giving women the right to vote for and to sit on these councils. An important law much discussed during the session was that limiting the hours of labor in the collieries. It was supported by the Socialists who demanded an eight-hour day, but the government fixed the working period at nine hours. It was an important departure in principle from the theory of economic non-interference in accordance with the Manchester doctrine. It passed its second reading by a large majority in the Chamber, but owing to the rejection of the Senate's amendments without discussion, a sharp issue was raised between the two bodies. The question of school canteens for the distribution of soup and clothing to children in public schools agitated the Clericals. Although it was a private charity it was subsidized by the communal governments. The Catholics complained that the charity was not extended to the private schools that were attended by the Catholic children. In some communes the canteens were organized by the local government and the question was whether they should be suppressed on the principle that the public funds could not be applied to the aid of public schools unless they were extended also to the free or private schools as that would discriminate against the religious beliefs of one class in the community. The law concerning *jus sanguinis*, which had been adopted by the Chamber in its previous session, passed the Senate. By this the child of a Belgian was to be a Belgian, and the child of a foreigner, a foreigner, but to remove uncertainties, a child born in Belgium of a father who was either born in Belgium, or had lived there at least ten years, was to be considered a Belgian from his twenty-second year, and a child born in Belgium of a foreign father was to be considered a Belgian if he had lived in Belgium from his sixteenth to his twenty-second

year. The effect of this was to naturalize a good many foreigners. Measures concerning workingmen's retiring pensions and contributions to mutual aid societies were also under consideration in the spring. During the autumn there was considerable criticism of the King and the Ministry in connection with the former's private sale of furniture and paintings. The Minister of Sciences and Arts issued an order for placing at the King's disposal for this purpose certain rooms in the State Museum. It was part of the policy long pursued by Leopold of disposing of his wealth so far as possible in his own life-time instead of leaving it to his heirs. It was argued that the furniture and paintings of the royal palaces were not his private property, but pertained to the civil list. An interpellation on the subject was made in the Chamber, but without avail.

The King died on December 18, and was succeeded by his son Albert, who took the oath of office on December 23. See LEOPOLD II. and ALBERT I.

BENT, SIR THOMAS. An Australian public official, died September 17, 1909. He was born at Penrith, New South Wales in 1838. He settled in Victoria in 1849, and for some time engaged in market gardening. In 1873 he was elected to the Legislative Assembly and was successively Commissioner of Public Works, Commissioner for Railroads and Vice-President of the Board of Land and Works. In 1904 he was elected Premier, which office he held until his death. He was at the same time Treasurer and Minister of Railways. He was knighted in 1908. In 1907 he visited England with a view to arranging a cheap transportation for immigrants to Victoria, and while there attracted much attention by a speech protesting against England's welcome to General Botha.

BENZOATE OF SODA. See FOOD AND NUTRITION.

BERI-BERI. See TROPICAL MEDICINE.

BERKELEY, CAL. See ELECTORAL REFORM.

BERMUDA. A group of over 300 small islands, islets, and rocks, lying east of North Carolina and 677 miles from New York, and constituting a British colony. Of the islands only about 20 are inhabited. The largest islands are St. George, Bermuda, Somerset, and Ireland. The total area is about 19 square miles. The estimated number of inhabitants, of whom over two-thirds are colored, was 19,588 in 1906. The capital and chief town is Hamilton, on Bermuda Island, with 2246 inhabitants in 1901. About one-third of the area is under cultivation. The chief products are lily bulbs and vegetables, especially onions. Imports and exports in 1906 were valued at £398,176 and £121,295 respectively; in 1907, £410,596 and £130,621 respectively. Imports of food supplies come principally from the United States, which receives most of the exports. Export values in 1907 included: Onions, £62,364; potatoes, £28,236; lily bulbs, £9593; arrowroot, £470. The total tonnage entered and cleared in 1907 was 829,376 tons (698,082 British). The colony has cable communication with Halifax and with Turks Island and Jamaica. There are 19 post-offices. Revenue and expenditure in 1907 amounted to £67,538 and £59,172, respectively; the public debt at the end of that year stood at £46,000. The colony is an important naval station, and is a favorite winter resort for Americans. It is administered by a governor (who

is commander-in-chief of the military forces). There are an executive council, a legislative council, and a representative house of assembly (36 members). The Governor in 1909 was Lieut.-Gen. Walter Kitchener.

BETHEA, SOLomon HICKS. An American jurist, died August 3, 1909. He was born in Dixon, Ill., in 1852, and graduated from the University of Michigan in 1872. From 1877 to 1898 he practiced law at Dixon, Ill. In 1899 he was appointed United States District Attorney at Chicago, and in 1905 he was made Judge of the Northern District of Illinois. Judge Bethea was a conspicuous figure in the politics of Illinois.

BETHMANN-HOLLWEG, THEOBALD VON. A German statesman, from July 14, 1909, Chancellor of the German Empire, succeeding Prince von Bülow. He was born at Eberswalde in 1856, and studied at the universities of Strassburg, Leipzig and Berlin. He has been a friend and adviser of the Emperor since early manhood. Von Bethmann early entered public life, and before he was 30 years of age was made Governor of Ober-Barnim. In 1896 he was made Provincial President of Potsdam, and in 1899 was President of the government of Bromberg. He was appointed President of the province of Brandenburg in 1901, and in 1905 was made Minister of the Interior; while occupying the latter position he also served as Vice-Chancellor under Prince von Bülow. Dr. von Bethmann has been a mild Conservative in politics, but as a Minister of the Crown he has always held that in administrative functions he must be non-partisan. For the circumstances of his appointment, see the article GERMANY, under History.

BIBLE SOCIETY, AMERICAN. A religious organization, founded in 1816 for encouraging the wider circulation of the Holy Scriptures without note or comment. The Society issued in the year ending March 31, 1909, 2,153,028 volumes, including Bibles, Testaments, Gospels, or other portions of the Scriptures in eighty-eight languages. Of this number 823,700 volumes were issued in the United States in the English language. A notable increase of Bible reading in China is indicated by sales of 408,000 volumes in the first six months of 1909, a total never approached in previous half years. From the Bible House in New York Scriptures go out in sixty-five languages; in some thirty languages of the immigrants there is a marked increase of the Scriptures required. In thirteen languages in Asia, Africa, and South America translations or revisions of the Scriptures are now in progress. Revision of the Spanish *Version Moderna* by a strong committee has been carried through the four gospels and circulated for criticism. The first reference Bible ever published in Chinese has been issued by the Society during the year at Shanghai. Nearly \$500,000 from the legacy of the late J. B. Cutter, Esq., has been received by the Society, and it has been notified also of a bequest of \$750,000 by the will of the late John S. Kennedy (q. v.). Both of these large legacies are without restriction and available for any purpose which the Board of Managers may approve. The Society is collecting money for an endowment fund of \$1,000,000 proposed by Mrs. Russell Sage, to which she conditionally offered \$500,000. To the seven general agencies for distribution existing in the United States, there were added during the year,

the Middle Agency, whose Secretary resided in Cincinnati, with his field in the States of Kentucky, Ohio, Mississippi and Alabama; and the Atlantic Agency, centering at Philadelphia, with Pennsylvania, New Jersey and Delaware for its field. Theophilus A. Brouwer, Esq., of New York City was elected president of the Society in May to succeed Daniel Coit Gilman, LL. D., who died October 13, 1908. The secretaries are: Rev. John Fox, D. D.; Rev. William I. Haven; Rev. Henry Otis Dwight, LL. D.; and the treasurer is William L. Foulke.

BIBLICAL CRITICISM. The last half decade in Biblical criticism is characterized by comprehensiveness rather than by intensity, and by the disposition to employ increasingly the apparatus furnished by the ancillary sciences. It has produced no epoch-making work and evolved no startling hypothesis. The period has been one of perhaps more sober study and patient research, tending on one hand to review positions and to fortify conclusions previously reached, on the other to apply the processes more thoroughly; more numerous have been the attempts also to popularize what has been already gained. The most spectacular work, as so often in the past, has been done with the aid of archaeology, particularly in Egypt and Palestine.

The great Bible dictionaries of Hastings and Cheyne belong to the preceding five years, but the former has been supplemented by the *Hastings' Dictionary of Christ and the Gospels* (2 vols., Edinburgh and New York, 1906-8). In the way of helps to the text the notable achievement is the completion of the *Brown-Driver-Briggs Hebrew Lexicon* (1906). No like work has been done for the New Testament, but Professor Adolph Deissmann, who at the end of the nineteenth century created an epoch in the philology of Biblical Greek, has been collecting materials and has begun a dictionary of Greek of that age which shall place historically the Septuagint and the Greek New Testament in the development of the Greek tongue. In Hebrew grammar nothing startling has been done, but for the New Testament Professor J. H. Moulton, in *Grammar of New Testament Greek*, vol. i., *Prolegomena* (Edinburgh, 1906) has begun the restatement of the principles of the languages in accord with what is required by the papyri and ostraca of Egypt and the re-study of European and Asiatic remains. Deissmann's *Philology of the Greek Bible* (London, 1908) is of note here. Also R. Helbing's *Grammatik der Septuaginta* (Göttingen, 1907).

In textual criticism the work done has been largely upon the versions. But not to be overlooked as important is the issue of Kittel's *Hebrew Bible* (Leipsic, 1906), of the first volume of the *Trinitarian Society's Hebrew Bible* (London, 1908), under the care of Dr. Ginsburg, and of A. B. Ehrlich's *Randglossen zur hebräischen Bibel* (Leipsic, 1908). The papal commission for the much needed revision of the Vulgate is at work, and the gathering of a wonderfully complete apparatus is already in large part accomplished. The monumental quarto issue of the Cambridge edition of the Septuagint has reached part 2 of vol. i. (1909). Within this period falls the completion of the reissue of the *West Saxon Gospels* (4 vols., Boston, 1904-06). H. Thompson has edited the Coptic (Sahidic) Version of Certain Books of the Old Testament from a Papyrus in the British

Museum (1908); W. C. Oesterly, a *Transcript of the Turin Ms. of the Twelve Prophets* (New York, 1908); W. Streitberg has done good work in editing *Die gothische Bibel* (part 1, Heidelberg, 1908), and the fifth part of *Old Latin Biblical Texts* has issued from the Clarendon Press (1908). Useful handbooks to the progress of work on these lines are W. O. E. Oesterly's *Our Bible Text*. Some recently discovered Documents (London, 1909), C. Henslow's *The Vulgate* (1909), and J. Drummond's *Transmission of the Text of the New Testament* (1909), while C. R. Gregory has issued *Die griechischen Handschriften des Neuen Testaments* (Leipsic, 1908), and has completed his *Textkritik des Neuen Testaments* (vol. iii., 1909). For Americans interested in textual criticism a fact of importance is the possession in Detroit of the "Freer Manuscripts" of the fifth or early sixth century, containing the Septuagint of Deuteronomy and Joshua, of the Psalms, and the Greek of the Gospels. None of these has as yet been fully studied or published.

For the higher criticism as bearing upon the Old Testament, archaeology has been effective. A general survey of this field is furnished by H. J. Dukinfield Ashley's *Prehistoric Archaeology and the Old Testament* (Edinburgh, 1908); cf. R. Kittel, *Studien zur Hebräischen Archäologie* (Leipsic, 1908); and S. R. Driver, *Modern Research as Illustrating the Bible* (Oxford, 1909). A discovery, the bearing of which is not yet fully worked out, is the finding of the name of Israel's god (in the form Ya-u) in tablets from the time of Hammurabi's father (c. 2260 B.C.) and also in some from the Kassite period 1893-1207 B.C.). While the defenders of the Mosaic origin of the Pentateuch have attempted to restate their case (J. Orr, *The Problem of the Old Testament*, London, 1906; H. M. Wiener, *Essays in Pentateuchal Criticism*, Oberlin, 1910), the critical case is regarded by its advocates as so assured that further study of the Pentateuchal "sources" is proceeding with confidence (A. R. Gordon's *Early Tradition of Genesis*, Edinburgh, 1907), and concessions are being made to the higher criticism in very conservative circles. Matured study of the code of Hammurabi has led to the conclusion that Pentateuchal legislation shows few traces of direct influence from this great code, and that what connection there is is the effect of general contact with Babylonian culture. For a later period in Hebrew history publication of Babylonian business documents of Ezra's time casts light on the life of Jews in Babylonia in that period (cf. A. T. Clay, *Light on the Old Testament from Babel*, Philadelphia, 1907; L. W. King, *Egypt and Western Asia in the Light of Recent Discoveries*, London, 1908). From Egypt the discovery of Aramaic documents belonging to the period 471-407 B.C. furnished information about the Jewish temple at Elephantine dating back to about 525 B.C., and incidentally helps in dating Joel definitely not as one of the earlier prophets but as belonging near the Greek period, as the advanced critics have maintained (Sayce and Cowley, *Aramaic Papyri Discovered at Assuan*, London, 1906; E. Sachau, *Drei aramäische Papyri*, Berlin, 1907; A. van Hoornacker, *De arameesche Papirusoorkonden van Elefantine* 1909; L. Belleli, *An Independent Examination of the Assuan and Elephantine Aramaic Papyri*, London, 1909). Equally interesting is

the determination of the other and later temple of the Jews in Egypt at Leontopolis (at Tel al-Yehudiyyeh, twenty miles south from Cairo); cf. J. G. Duncan, *Exploration of Egypt and the Old Testament*, (New York, 1909). For the criticism of passages in which the history and topography of Jerusalem are of help, three works have recently appeared unusual in the weight of the authorities back of them. They are G. A. Smith's *Jerusalem* (London, 1908); Selah Merrill's *Ancient Jerusalem* (New York, 1908); and C. R. Conder's *City of Jerusalem* (London, 1909). The excavations at Gezer and Taanach illustrate the history of Palestine in the entire Biblical age, and among the conclusions warranted is the absence of human sacrifice in the earliest period of Hebrew history (R. A. S. Macalister, *Bible Side Lights from the Mound of Gezer*, London, 1908; H. Vincent, *Canaan d'après l'exploration récente*, Paris, 1907). A notable contribution in the way of historic side-light is J. A. Montgomery's *The Samaritans* (Philadelphia, 1907). Dr. Kent is continuing his work of presenting conclusions in Old Testament criticism in his *Students' Old Testament* (vols. i-iv., New York, 1904-09).

In the province of Hebrew religion the disposition to study the subject in the light of comparative research is very marked, as is illustrated by: W. E. Orchard, *The Evolution of the Old Testament Religion* (London, 1908); W. O. E. Oesterly, *The Evolution of the Messianic Idea* (London, 1908); and E. Sellin, *Die alttestamentliche Religion im Rahmen der andern Altorientalischen* (Leipsic, 1909). Modern methods are exemplified further in J. H. Kaplan's *Psychology of Prophecy* (Philadelphia, 1908), and W. H. Bennett's *Religion of the Post-exilic Prophets* (Edinburgh, 1908).

In the New Testament most of the work done has been the restatement of the results of textual and literary criticism. The important issues are C. R. Gregory's *Canon and Text of the New Testament* (New York, 1907), and *Einleitung in das Neue Testament* (Leipsic, 1909); J. Beet, *The New Testament, its Authorship, Date, and Worth* (London, 1909); the appearance in English of T. Zahn's monumental *Introduction to the New Testament* (3 vols., Edinburgh, 1909), and of W. Wrede's *Origin of the New Testament* (London, 1909); the Abbé Jacquier has completed his conservative statement in his *Histoire des livres du Nouveau Testament* (4 vols., Paris, 1904-09); a vigorous but sober work is A. S. Peake's *Critical Introduction to the New Testament* (London, 1909). The storm centres are still the Gospels. The disposition still to maintain the priority of Mark's Gospel is manifest, and the existence of the sources asserted by the critical school is even more widely accepted. As in the case of the Pentateuch, attempts are being made to advance knowledge of these sources, and to reconstruct the documents behind the present Gospels (A. Harnack, *Lukas der Arzt*, Leipsic, 1906, and *Reden Jesu*, 1907; J. Wellhausen, *Das Evangelium Marci*, Berlin, 1909). In the work of Harnack first named above and in *Apostelgeschichte* (1907) incidentally the Lucan authorship of the third Gospel and of Acts is supported. Over the problem of the Fourth Gospel no great change has come. Conservative criticism defends the apostolicity, M. Lepine, *L'Origine du quatrième evangile* (Paris, 1907), which makes genuine all writings associated

with the name of John; and T. Zahn in his commentary on the Gospel (Leipsic, 1908), while the critical pushes the attack upon the genuineness and historicity (E. F. Scott, *The Fourth Gospel, Its Purpose and Theology*, Edinburgh, 1908; F. C. Burkitt, *Gospel History and its Transmission*, 1908; J. Wellhausen, *Das Evangelium Johannis*, Berlin, 1908; and B. W. Bacon, *The Fourth Gospel in Research and Debate*, New York), reviews the latest discussions on this subject and acquaints the reader with the very latest phases of discussion. The attack of the Dutch school upon all the Pauline epistles finds no echo and scholarship in general refuses to accept this extreme position. A useful review of results in exegesis is furnished in P. Fiebig's *Aufgaben der neutestamentlichen Forschung in der Gegenwart* (Strasburg, 1909). The study of the Bible as literature continues, as exemplified by such volumes as A. Wünsche's *Die Schönheit der Bibel* (Leipsic, 1908), and C. F. G. Heinrich's *Der literarische Charakter der neutestamentlichen Schriften* (Leipsic, 1908).

BICYCLING (as a sport). See CYCLING.

BILLIARDS AND POOL. The principal events in the billiard history of 1909 were all held in the Madison Square Concert Hall, New York City, and included two world's championship tournaments at 18.1 and two tournaments at 18.2. In the first 18.1 contest (January 26) George F. Slosson defeated George Sutton by 500 points to 328, scoring a high run of 56 and a grand average of 8.62. Sutton then challenged Slosson to another match which was played on June 2 and which Sutton won by the score of 500 to 201. Sutton made a high run of 70 and had an average of 12.82. The first 18.2 championship tournament was held March 22 to April 2, twenty-one games being played. Ora C. Morningstar won the match with George Sutton as second, but in July resigned the championship. A match held in Chicago followed at 18.2 between William F. Hoppe and George Sutton, the latter winning after three nights' play. The second world's championship tournament at 18.2 took place November 22-30 and resulted in a triple tie between Calvin Demarest, George Sutton and H. P. Cline. In the play-off Demarest finished first, Sutton second and Cline third. Sutton scored the highest run of the tournament (235) and also made the highest average (19.57) for 7 games. The showing made by Demarest, who had entered the professional ranks for the first time in the 18.2 tournament held in January, surprised the experts. This player was the holder of the National Amateur Championship at 14.2. An amateur championship tournament at 18.2 was held at the Liederkranz Club, New York, in April, which was won by H. A. Wright. C. F. Conklin received second place after a play-off of a triple tie. The three cushion championship changed hands five times during the year, finally resting with Alfred De Oro. De Oro made the highest run (11) against Thomas Hueston. The pool championship was won from John Kling at Kansas City in November by Thomas Hueston, the score being 800 to 653.

BINARY MIXTURES. See CHEMISTRY.

BIOLOGICAL CHEMISTRY. See CHEMISTRY.

BIOLOGICAL STATIONS. On the Atlantic coast of the United States, marine stations

were maintained during the summer of 1909 at South Harpswell, Me., under the control of Tufts College; the Marine Biological Laboratory and the laboratory of the United States Bureau of Fisheries at Woods Hole, Mass., the Station for Experimental Evolution and the laboratory of the Brooklyn Institute at Cold Spring Harbor, N. Y.; the United States Bureau of Fisheries laboratory at Beaufort, N. C.; the Harvard University station in Bermuda; and the laboratory of the Carnegie Institution at Dry Tortugas, Florida. At the Marine Laboratory at Woods Hole and at the laboratory of the Brooklyn Institute courses of instruction were offered. At the other laboratories mentioned, the work was entirely that of research. In the Middle and Western States a number of college and universities conducted summer laboratories; the University of Michigan on land owned by the University near the Straits of Mackinaw, offering courses in field zoölogy and botany, with especial reference to ecological technique; the State University, the State College, and the State Normal Schools of Washington, a laboratory on Friday Harbor, on San Juan Island, in Puget Sound; the University of North Dakota, a laboratory on the shores of Devil's Lake, a large body of blackish water presenting many interesting ecological problems; a mountain laboratory at Fal-land 9000 feet above sea level, conducted by the University of Colorado; and a station under the control of the University of Minnesota at Port Renfrew, Vancouver Island, were among those announced for the year.

Professor W. E. Ritter, Director of the San Diego Station at La Jolla, Cal., has resigned his position as Professor of Zoölogy in the University of California, to devote his entire time to the work of the laboratory.

The United States Bureau of Fisheries has established a biological station at Fairport, Iowa, for the study of the fresh water mussel. See ZOOLOGY.

The Dove Marine Laboratory, in connection with Armstrong College, was formally opened on December 29, 1908, by the Duke of Northumberland. The County Council of Northumberland have contributed £100 per annum for its support.

BIOLOGY. In evolutionary discussions, there was the same lack of agreement among various workers as to the value of the several factors that characterized the literature of 1908. Complete agreement is perhaps to be looked for as little here as in theology or politics, but personal animosities are unfortunately too frequently shown in the discussions. Thus Poulton, who is a thoroughgoing believer in the all-sufficiency of natural selection, criticises with great severity the claims of the Mendelians, or as he calls them, the "Batesonians." His own position is based largely on phenomena of insect coloration, where he argues that colors are in many cases certainly protective, and could only have reached their present condition through natural selection of minute variations. Mutations are, he thinks, very rare, and have played little part in the course of evolution. For this position, however, Poulton offers little direct evidence.

Bateson, on the other hand, while expressing himself less enthusiastically in a new edition of his work on Mendelism than he did in the first edition, published in 1902, still maintains

that the study of genetics, illuminated as it is by the law of Mendel, is the only way along which progress is to be made in the study of evolutionary processes. The work of the biometricalists he considers of no value in this connection, while in regard to adaptations arising through the selection of small variations, he shows that this would be difficult to accomplish in any non-Lamarcian evolution, and also claims that the severity of the struggle for existence has been overestimated. "Natural Selection is stern, but she has tolerant moods."

An important book, from the standpoint of the student of genetics, is this new edition of Bateson's *Mendel's Principles of Heredity*, in part a reprint of Mendel's original papers, and in part summarizing the work of Mendelians in recent years. Bateson reviews the evidence for the inheritance of sex as a Mendelian phenomenon, and concludes that most observed phenomena can be explained on the assumption that the female is heterozygous, with femaleness dominant, while the male is a homozygous recessive. Wilson and others, from cytological studies, have concluded that the male is heterozygous, and the female homozygous. Bateson suggests that the discrepancy is due to the fact that animals are not all alike in this respect. It is true that Bateson's results are derived from study of vertebrates and lepidopterous insects, while Wilson's study of the chromosomes are on other groups of insects. The accessory chromosome has not been found in the Lepidoptera. In either case it is clear that sex is determined by gametic differentiation, and not by external conditions following fertilization.

It has been shown for plants by de Vries that many apparently homogeneous species of plants are really made up of distinct races, and that no amount of selection will permanently transform one of these races into another. Jennings showed that the same condition holds for protozoa. From a culture of *Paramaecium* he isolated eight races differing from one another in size. Within the limits of a race occur considerable size variations. If, however, we breed from the largest and from the smallest of any one race, we find that the average size of the descendants in the two cases is the same. Size differences in the race are due to different conditions of nutrition, and no permanent improvement in size can follow any amount of selection. If we breed from the largest individuals of the culture, we gradually eliminate the smaller races, but no amount of breeding will increase the size of the animals beyond the average of the largest race. These results are important, in view of the supposed ability of natural selection to modify indefinitely a species.

To explain cases where organs, in themselves indifferent, are apparently affected by natural selection, Darwin supposed that these vary because "correlated" with organs that are useful, but the nature of this correlation was not clear. It is now known that many organs of the body produce internal secretions, or "hormones," which affect the character of other organs, and Parker now suggests that one organ may be correlated with another because affected by hormones produced by it. If natural selection causes a change in the hormone-producing organ, the hormones will probably vary, with a

consequent variation in the character of the correlated organ.

Evolutionists in recent years are much less inclined to deny the possibility of the inheritance of acquired characters than they were twenty years ago, though there have been as yet no definite experiments proving that it actually does occur. Lutz reports that in breeding experiments on pomace flies he has kept the insects for forty-two generations in small glass tubes, where the use of the wings was impossible. In spite of the disuse of these organs for this length of time, there was no indication of a decrease in size. On the other hand Eigenmann, in an elaborate paper on "Cave Vertebrates of America," published by the Carnegie Institution, reaches the conclusion that the bleached condition of the cave fauna, and the degenerate condition of the eye, are both to be explained through the transmission of functional modification.

Coulter, from the standpoint of the botanist, declares there is no evidence that natural selection has had anything to do with the origin of species. He cites especially the formation of thorns, which Weismann considers excellent examples of protective adaptations and shows that they are not protective because they do not appear when the plant is young and needs them most, and because experiment has shown that they arise merely as a response to poor nutritive conditions. Ritter and Ruthven, in studies of Ascidians and snakes respectively, declare that there is no evidence for a necessary relation between the environmental conditions of the animals, and their characters.

Osborn, replying to Morgan's statement that the philosophic zoölogist has chosen undirected variations as furnishing the material for natural selection, challenges the zoölogists to produce a single instance in which adaptive characters are being accumulated through the selection of undirected variations. He maintains that the philosophic paleontologist finds the material for natural selection in the ensemble of an enormous number of characters, each of which is a unit, pursuing its independent history and moving in direct lines of which the paleontologist has proof, but totally fails to understand.

Reighard, as a result of experiments on coral reef fishes, concludes that the brilliant color of the fishes is not in any sense for warning purposes, because the fish are eaten by other fish if caught, but ordinarily are protected by their habit of living in the reef, among the coral heads. The animals have no need of protective colors, being sufficiently protected by the corals; they have no need for aggressive coloration, because they can obtain their invertebrate food even if brilliantly colored; and the colors are not warning as stated above. Under these conditions, the coloration of the animal would follow whatever direction the forces at work in the organism would lead it, and in the case of the coral reef fish, it has led to brilliant coloration. Reighard proposes to call this "Immunity Coloration," since it develops because the animal is immune to the various causes which have produced elsewhere other types of coloration.

Thayer argues that there is no true mimicry, but that brilliant colors, as in the skunk, various insects, etc., are color devices which enable the animal to blend with the background, and thus be protected. Apparent mimicry of one

animal by another is simply that since the two live on identical backgrounds, they must vary in the same direction if they are to be protectively colored.

An address given before the International Zoölogical Congress in 1907 by J. Loeb, has now been published in an expanded form under the title, "Die Chemische Entwicklungserregung des tierischen Eies." The formation of a fertilization membrane which is essential to the development of the egg is brought about by a "lysin" which comes into the egg with the sperm. Loeb elsewhere states that artificial parthenogenesis may be produced by any agency which tends to produce haemolysis, as fatty acids, ether, alcohol, chloroform, solanin, digitalin, or even the blood of mammals.

BIRD PROTECTION. See ORNITHOLOGY.

BIRDSALL, WILLIAM W. An American educator, died March 17, 1909. He was born at Richmond, Ind., in 1844, and graduated at Earlham College in 1873. From 1885 to 1893 he was instructor in mathematics at the Friends' Central School in Philadelphia. In 1898 he was elected president of Swarthmore College, serving until 1902. In the latter year he became principal of the Girls' High School in Philadelphia.

BIRTH RATE. See VITAL STATISTICS.

BISHOP, ROBERT R. An American jurist, died October 7, 1909. He was born in 1834, and graduated from Harvard Law School in 1857. Afterwards he began the practice of law in Boston. He served in both branches of the State Legislature, and for three years, 1879 to 1882, was President of the State Senate. In 1882 he was Republican candidate for Governor, but was defeated after a close contest by Benjamin F. Butler. Most of his legal work was concerned with railway litigation. In 1888 he was appointed an associate justice, and served continuously up to within several months of his death.

BISMARCK ARCHIPELAGO. A German protectorate northeast of German New Guinea, to which it is attached administratively. Including the German Solomon Islands (q. v.), the estimated area is 22,000 square miles, and the estimated population 250,000. The white inhabitants in 1908 numbered 463 (322 German). There are Wesleyan and Catholic missions. The total cultivated area in 1908 was 11,987 hectares. The chief products are copra, cotton, rubber, and coffee. In 1907 the imports amounted to 2,589,000 marks, and the exports 1,690,000 marks (copra, 1,521,971 marks).

BLACKWELL, HENRY B. An American publicist and editor, died September 8, 1909. He was born in Bristol, England, in 1825. In 1832 his parents emigrated to the United States, settling, in 1838, in Cincinnati. He began his career as an office boy, but finally became traveling partner in a hardware firm. In 1853 he took an active part in the Free Soil movement. In 1855 he married Lucy Stone, a prominent Abolitionist. In 1869, with Julia Ward Howe, William Lloyd Garrison, George William Curtis and others, he took part in organizing the American Woman Suffrage Association. For twenty years he was secretary of this society. In 1872, he, with his wife, assumed the editorship of the *Woman's Journal*, started in 1870 by Mary A. Livermore. This position he held

until his death. Mr. Blackwell was one of the most aggressive advocates of woman suffrage in the United States.

BLENNERHASSETT, SIR ROWLAND. A British publicist and educator, died March 22, 1909. He was born in County Kerry, Ireland, in 1839. He was educated at Christ Church, Oxford, and studied also at Louvain, Munich and Berlin. In 1865 he was chosen Liberal member of Parliament from Galway, and from 1880 to 1885 represented his native county. He was an inspector of schools from 1890 to 1897; and president of Queens College, Cork, 1897 to 1905. Sir Rowland Blennerhassett wrote much in the reviews, chiefly on foreign topics. He was an ardent opponent of the Pan-Germanic movement. His publication of an interview with Kaiser Wilhelm II. in the *Daily Telegraph* in 1908 was one of the most sensational political episodes of that year.

BOILERS. The total number of boiler explosions in 1909, according to the magazine *Locomotive*, published by the Hartford Steam Boiler Inspection and Insurance Co., was 550, the greatest number reported in any one year. There were 470 in 1908, 471 in 1907, 431 in 1906, and 450 in 1905. But while the number of explosions was greater in 1909 than ever before, the number of deaths was less than it has been for any year since 1904. The number of persons killed by boiler explosions in 1908 was 227, against 281 in 1908, 300 in 1907, 235 in 1906, 383 in 1905, and 220 in 1904; and the number of persons injured (but not killed) in 1909 was 422, against 531 in 1908, 420 in 1907, 467 in 1906, 585 in 1905, and 394 in 1904.

During the year 1909 there were many very serious explosions, but there was none in which the loss of life approached the appalling total that characterized the great explosion at Brockton, Mass., in 1905, or the one on the U. S. gunboat *Bennington*, in the same year. The worst boiler explosion of 1909, so far as loss of life and injury to person was concerned, was the one that occurred in Denver, Colo., on June 15. By this explosion six persons were killed, and six others were more or less seriously injured. This explosion resulted in an immediate damage to property of \$60,000.

BOLIVIA. An interior republic of South America. The capital is Sucre. The ten departments and colonial territory comprising the republic have an estimated area of 473,560 square miles and an estimated population (1908) of 2,267,935. The census of 1900 showed 1,744,568 inhabitants, and the estimate of 1906, 1,953,916. In 1900 50.9 per cent. of the inhabitants were Indians, 26.7 per cent. mestizos, and 12.7 per cent. whites. Estimated population of the larger towns (1906): La Paz, 67,235; Cochabamba, 24,512; Potosi, 23,450; Sucre, 23,416; Oruro, 20,670; Santa Cruz, 20,535; Tarija, 7817; Trinidad, 4810. Primary instruction is free and nominally compulsory. Some provisions are made for secondary and higher education. The state religion and that prevailing among the people is Roman Catholicism.

PRODUCTION AND COMMERCE. Bolivia depends mainly upon her mineral wealth, which includes numerous metals and is rich, abundant, and widely distributed. Next in importance is agriculture, but both this industry and mining, in proportion to the capabilities of the country, are little developed, partly on account of the difficult

ties of transportation. Among vegetable products, the most important commercially is rubber, although in 1908 the output showed a marked decline; other products are cacao, cinchona, and coffee. Wheat, corn, barley, and potatoes are cultivated, mainly for local consumption. The leading mineral products are tin, silver, and copper. The annual gold production amounts to about \$349,000. In 1908 the production of tin was greater than in 1907, but, owing to a fall in price, the value was less. Bolivian tin assays 60 per cent. pure. The tin and bismuth mines and the copper mines of Corocoro are among the richest in the world, but development, especially of the copper and bismuth, has not yet attained large proportions. Foreign commerce has been as follows, in bolivianos:

	1906	1907	1908
Imports	21,997,000	34,562,000	40,807,857
Exports	50,757,000	45,902,000	43,786,198

The principal imports are cotton and woolen textiles, provisions, cattle, machinery and hardware, and wines and spirits. The chief export is tin barilla, which in 1907 amounted to 27,677,781 kilos, valued at 29,892,003 bolivianos; in 1903, 29,938,283 kilos, valued at 29,501,021 bolivianos. The mining sections from which the 1908 export came were: Potosi, 18,139,148 kilos; Oruro, 9,620,025; La Paz, 2,008,932; Cochabamba, 170,177. Next to tin ranks silver, with an export value in 1907 of 6,483,464 bolivianos, and in 1908, 7,007,037 bolivianos. Other exports in 1907 and 1908 were, in bolivianos, respectively: Copper, 2,562,892 and 1,233,195; bismuth, 936,093 and 306,522; gold, 9730 and 51,500; rubber, 8,841,380 and 4,905,493. Of the imports in 1908 Germany furnished approximately 25 per cent., the United States, 20 per cent., Great Britain, 16 per cent., Chile, 9 per cent., and France, less than 7 per cent. The principal imports from the United States are railway materials and cotton goods. On account of the construction of an Argentine railway to Quiaca on the Bolivian frontier, imports by way of Argentina showed a notable increase in 1908.

COMMUNICATIONS. Difficulties in transportation and travel constitute one of the chief obstacles to the material development of the Republic. In 1909 the trunk railway lines had a length of about 400 miles, affording direct rail communication from Lake Titicaca, via Oruro, to Antofagasta, on the Chilean coast. Branch lines were under construction from Oruro to Cochabamba and Potosi, and new lines had been located from Potosi to Tupiza and from La Paz to Puerto Pando. Preliminary work has begun on a line from Brazil to the Beni region, about 300 miles; it will open up a country rich in rubber and cabinet woods. From Arica (Chile) to La Paz (337 miles), a railway is under construction, of which 186 miles will be in Bolivian territory; branches will connect with the Tacora and with Corocoro. There is communication by rail from La Paz to Guaqui (59 miles), thence by steamboat on Lake Titicaca to Puno, Peru (180 miles), and from that point by rail to Mollendo, on the Peruvian coast (324 miles). River communication by steamboat is open from Villa Bella to Pará (Brazil), on the Amazon (2516 miles), and from Puerto Suarez to Montevideo and

Buenos Ayres (about 1740 miles), by way of the Paraguay, Paraná, and Plata rivers. The aggregate length of Bolivian navigable rivers is estimated at 12,000 miles. There are over 2300 miles of wagon roads, about 1800 miles of which connect the various industrial centres.

For 1908 the number of post-offices is reported as 192, and of postal employees, 277. The telegraph system comprised 2986 miles, of which 2088 miles were owned by the government.

FINANCE. Complete and final figures of national finance are not available. The estimated revenue and expenditure for 1908 were: 16,025,378 bolivianos and 16,618,515 bolivianos respectively, for 1909.

Besides treasury bonds amounting to 2,500,000 bolivianos, the internal debt stood at 4,346,529 bolivianos in 1907, when there was no recognized external debt. Early in 1909 it was announced that the Bolivian government had contracted a loan of \$2,500,000 with J. P. Morgan and Company, of New York.

On September 14, 1906, the Congress enacted a law providing for the adoption of the gold standard, which became the standard of the country by the President's promulgation of December 31, 1908. The monetary unit is made the boliviano, worth 38.93 cents (that is, 12.50 bolivianos to the pound sterling). Under the silver standard, the value of the boliviano fluctuated; in July, 1908, it was about 39.3 cents, and in October, 1907, about 49.9 cents.

ARMY. Compulsory military service is required of males from the twentieth to the fiftieth year, but this has never been vigorously enforced, though various reforms in connection with a reorganization of the army in 1907 were put under way. There were in 1909 five infantry battalions, a regiment of cavalry, and a mountain artillery regiment, with an extra cavalry and an extra artillery regiment in process of formation, making a standing army of about 3000 men, though reserves, territorial guards and other forces make possible a war strength estimated from 80,000 to 177,800 men upon mobilization. The Mauser rifle model of 1898 is used and there were being added in 1909, modern shielded field guns from the French Creusot works.

GOVERNMENT. The executive authority is vested in a president, who is elected for a term of four years, and is assisted by a cabinet of five members. The legislative power devolves upon a congress of two houses, the Senate (16 members) and the Chamber of Deputies (72 members). The departments are administered by prefects, appointed by the President. The President is Eliodoro Villazón (elected May 2, 1909).

HISTORY. On January 13 the arbitration treaty pending between the United States and Bolivia was ratified by the United States Senate. On July 10, after the announcement of the award in Peru's favor by the President of Argentina, Figueroa Alcorta, in the boundary dispute between Bolivia and Argentina, both the Argentine and Peruvian legations were mobbed, but the Bolivian government promised satisfaction for these acts of violence and declared martial law. After the announcement of the government that it would not accept the award the disorders ceased (July 14). At the end of July it was announced that Bolivia and Peru had agreed to open direct negotiations with each other for the adjustment of the dispute. See

ARGENTINA and **ARBITRATION, INTERNATIONAL.** In August President Ismail Montes retired and was succeeded by Señor Villazon on August 12. President Montes was opposed to the Argentina boundary award and Señor Villazon believed in accepting it, although it was unfavorable to Bolivia.

BOLL WEEVIL. See COTTON.

BOOTS AND SHOES. The depression and uncertainty in this industry which prevailed in 1908 were not as marked in 1909. At the close of the former year the agitation for free hides was plainly in evidence and during 1909 the tariff (q. v.) figured largely in the boot and shoe industry. At a meeting of the Boot & Shoe Manufacturers' Association, held in New York on June 11, a free hide campaign was put under way and organized work for the cause was done during the tariff discussions. The bill when passed contained a free hides proviso and the first cargo of hides imported free of duty arrived from South America and was entered at the port of Boston, August 6. The tariff law also reduced the duties on imported shoes from 25 per cent. to 15 per cent. ad valorem, and the new rates went into effect on October 1. An industrial dispute of long standing between the Boot and Shoe Workers' Union at Brockton, Mass., and the W. L. Douglas Company, which was particularly serious in 1908, was settled in October, 1909, and the latter began to put in operation at Brockton its manufacturing plants which had been closed or moved away on account of difficulties with organized labor. In New England the boot and shoe industry showed desirable improvement over 1908, and Haverhill and Brockton exceeded all previous years in the amount of their shipments. The shoe shipments from Boston, by no means the greatest on record, showed a substantial gain over 1908. Despite the tariff reduction at the end of the year there did not seem to be any prospect of cheaper leather and it was evident that a general increase in the price of boots and shoes would be agreed upon in the coming year.

SHOE SHIPMENTS FROM BOSTON

1904.....	4,756,649	cases
1905.....	5,058,795	"
1906.....	5,082,578	"
1907.....	4,730,191	"
1908.....	3,698,818	"
1909	4,175,837	"

The shoes shipped from Boston are estimated at 75 per cent. of the output of New England and 50 per cent. of the production of the United States.

The distribution of American boots and shoes covers a wide range of countries. Tropical and subtropical countries offer the largest market for this class of manufactures exported from the United States. Cuba stands at the head of the list, fully 35 per cent. of the year's exports of boots and shoes having been sent to that republic, compared with 13 per cent. to the United Kingdom, 10 per cent. to Canada, 9½ per cent. to Mexico, 8 per cent. to other West Indies and Bermuda, nearly 7 per cent. to Central America, about 3 per cent. to Germany, and about 2 per cent. each to France and the Philippine Islands.

In addition to the exports of American boots and shoes to foreign countries there were sent to Alaska in the 12 months of 1909 103,882 pairs, valued at \$257,645; to Hawaii, 165,684

pairs, valued at \$291,847; and to Porto Rico, 659,284 pairs, valued at \$716,715. The number of pairs sent to the Philippines (which, however, are included in the statement of exports to foreign countries, above recorded) was 191,398 pairs, valued at \$375,861, making the total shipments to the non-contiguous territories of the United States 1,120,248 pairs, valued at \$1,641,868.

In its contributions to the world's requirements of boots and shoes the United States has made rapid progress, especially in recent years. In 1879 the quantity exported was but 364,333 pairs; in 1889, 584,347 pairs; in 1899, 2,664,370 pairs; and in 1909, 6,773,934 pairs, the largest number on record. Meantime the value of exports increased from \$417,758 in 1879 to \$642,065 in 1889, \$3,688,435 in 1899, and \$11,443,225 in the year 1909, which, however, was slightly less than in 1907, when 64 million pairs were exported. These figures relate only to boots and shoes of leather, and do not include those of india rubber, of which over 3,000,000 pairs were exported in 1909.

This growth of exportations, from 364,000 pairs in 1879 to 6,750,000 in 1909, has brought the United States to the head of the list of boot and shoe exporting nations of the world, if measured by value of the exports, or second in the list, if measured by the number of pairs exported. The principal boot and shoe exporting countries are Germany, Spain, France, the United States and the United Kingdom, and the exports from the United States exceed in value those of any other country, though in number of pairs exported the United Kingdom still exceeds the United States. In the calendar year 1893 the number of pairs of boots and shoes exported from the United States was but 588,003, valued at \$726,210, and those from the United Kingdom, 8,316,588, valued at \$8,259,580. In 1896 the total exportation of American boots and shoes for the first time exceeded one million pairs, being 1,141,033 pairs, against 8,940,216 pairs from the United Kingdom. In the calendar year 1909, the quantity exported from the United States was 6,773,934 pairs, valued at \$11,443,225 and from the United Kingdom, 10,089,960 pairs, valued at \$11,170,768. The values of boot and shoe exportations from other leading exporters were, in 1908, the latest available year, from Germany, \$3,648,000; France, \$2,057,000; and Spain, \$1,456,000.

The following table shows the number of pairs and value of boots and shoes exported from the United States and the United Kingdom, respectively, at quinquennial periods from 1893 to 1909. It will be noted that the growth in exportations from the United States has been over 1000 per cent. and in those from the United Kingdom but about 35 per cent.; also that the average value per pair of the boots and shoes exported, including those of all classes and for children as well as for adults, was, in 1909, \$1.69 for those from the United States, and \$1.11 for those from the United Kingdom.

United Kingdom		
Calendar Year	Pairs	Value
1893	8,316,588	\$ 8,259,580
1898	7,667,040	7,270,215
1903	9,286,296	8,980,542
1908	9,170,364	10,140,589
1909	10,089,960	11,170,768

United States		
Calendar Year	Pairs	Value
1893	588,003	\$ 726,210
1898	1,391,220	1,944,428
1903	4,579,164	7,244,726
1908	5,967,793	10,031,227
1909	6,773,934	11,443,225

BORNEO. An East Indian island, having an estimated area of 293,500 square miles and an estimated population of 1,680,000. The island belongs partly to Great Britain and partly (about two-thirds) to the Netherlands. See BRITISH NORTH BORNEO; BRUNEI; SARAWAK; and DUTCH EAST INDIES.

BOSNIA AND HERZEGOVINA. Formerly Turkish provinces, lying west of Servia and south of Croatia and Slavonia; from 1878 to 1908 occupied and administered by Austria-Hungary; annexed to Austria-Hungary, by proclamation of the Emperor-King, September 5, 1908. Area, 19,702 square miles. Population (1908), 1,828,379, about one-third Mohammedans and somewhat more than one-third Oriental Orthodox. The capital and largest town is Sarayevo, with over 41,500 inhabitants. Primary instruction is free, but not compulsory. In 1907 there were 379 primary schools, 940 lower Mohammedan schools, five gymnasias, one realschule, 11 advanced schools for girls, and a number of institutions for technical and industrial instruction. Agriculture, although in a low state of development, is the principal occupation of the people. Tobacco is a leading crop, and corn, wheat, barley, rye, millet, buckwheat, potatoes, sugar beets, flax, hemp and fruits are cultivated. The raising of live-stock is important. There is a considerable output of minerals, including coal, iron, salt, copper, manganese, chromium, and mercury. Coal production in 1907 amounted to 621,178 tons, iron ore 150,684 tons, manganese 7000 tons; the production of raw iron was 48,945 tons, valued at 3,298,947 kronen (1 kronen = 20.3 cents), wrought iron 24,233 tons (4,882,990 kronen), cast-iron goods 5072 tons (985,002 kronen). The output of salt in 1907 was 21,148 tons, valued at 2,326,269 kronen. Manufacturing is not highly developed, but there are various factories for sugar, chemicals, wood products, matches, etc. Bosnia and Herzegovina are included in the Austro-Hungarian census territory. The principal imports are cotton textiles, cereals, flour, clothing, iron manufactures and machinery, sugar, and beverages. The leading exports include cereals and flour, vegetables and fruits, live-stock and skins, iron and chemicals. In 1907 the estimated imports from Austria-Hungary and foreign countries were valued at 114,492,195 kronen; the exports, 112,100,703 kronen. In 1908 the imports and exports were valued at 121,686,325 kronen and 108,951,274 kronen, respectively. The length of railways reported in operation in 1909 was 384 miles. Post-offices in 1908 numbered 137, and telegraph offices 164, with 1931 miles of line and 4824 miles of wire. The estimated revenue and expenditure for 1908 amounted to 66,487,959 kronen and 66,482,018 kronen, respectively; for 1909, 71,320,483 and 71,299,013, respectively. Bosnia and Herzegovina are administered by the Austro-Hungarian minister of finance (Baron Stephan Burian de Rajecz in 1909). For history, see AUSTRIA-HUNGARY.

BOSTON. See MASSACHUSETTS.

BOSTON PUBLIC LIBRARY. A public institution which embraces the library system of Boston, Mass. It was founded in 1854. The number of volumes in the library on December 31, 1909, was nearly 1,000,000. The total circulation for 1909 for home use was 1,647,846, of which 297,567 volumes were taken from the central library, and 1,124,456 from the branches and stations. The library had in 1909 about 30 branches throughout the city. The librarian is Horace G. Wadlin.

BOTANICAL SOCIETY OF AMERICA.

See BOTANY.

BOTANY. One of the events of 1909 of great importance to botanists was the celebration of the one-hundredth anniversary of the birth of Charles Darwin, and the fiftieth anniversary of the publication of his *Origin of Species*. This dual event was observed by scientific societies throughout the world, and a formal Darwin centenary celebration was held at Cambridge University, England, on June 22, 1909, which was attended by 248 official delegates representing universities, societies, and other scientific bodies in 28 countries of the world. The sixteenth annual meeting of the Botanical Society of America was held at Boston, December 26, 1909, to January 1, 1910, in affiliation with the American Association for the Advancement of Science. The Society of Plant Pathologists held its meeting at the same time. A new botanical laboratory was formally opened in the University College, London, on December 17, 1909. Sir Daniel Morris, well-known for his work in economic botany, retired from the position of Commissioner of Agriculture for the British West Indies and Francis Watts was appointed his successor. Dr. G. Karsten was appointed professor of botany in the University of Halle, in succession to the late Dr. F. Nolle. Dr. Carl Corens has been chosen successor to Dr. W. Zopf, deceased, at Münster. Dr. H. Molisch succeeded Dr. J. Wiesner as director of the plant physiological laboratory at Vienna University. James Britten, editor of the *Journal of Botany*, retired after 40 years' service. Dr. E. Ch. Hansen, well-known for his work on yeasts and fermentation, and Prof. J. Barbosa Rodrigues, director of the botanic garden at Rio Janeiro, died during the year.

PLANT BREEDING. Among some of the recent investigations on economic lines that show the applicability of the Mendelian theory to plant breeding may be mentioned those of DeLoach and Ball on cottons, the latter author showing 21 unit characters in cotton plants. Sutton, in crosses with turnips and other species of *Brassica*, shows Mendelian behavior of the unit characters, fleshy roots, and curled leaves. Nilsson-Ehle shows practically all the supposed mutants of wheat, oats, and other cereals split in Mendelian fashion. East found that flint and dent corns differ in a number of correlated characters and these combinations are maintained when bred with sweet corn. Emerson shows that in beans there are two distinct units for mottling, one typical Mendelian, the other only evident in the heterozygote state. Bauer thinks the great number of fluctuating variations in garden nasturtiums is due to Mendelian splitting of minor unit characters. The matter of non-splitting hybrids has been considered by Lock, Burbank, and others, and its importance should be rigidly investigated. Dr. Bishire has

examined the starch grains of peas in reference to those found in hybrids, and Miss Wheldale has given an account of the behavior of floral pigments in hybrids. Shull discusses the pure line method of corn breeding, while Collins maintains that broad breeding in corn will give the best results. The present status of plant breeding with alfalfa, cotton, tobacco, cereals, fruits, for disease resistance, etc., is well summarized in the fifth Annual Report of the American Breeders' Association. The annual meeting of this Association was held at Columbia, Missouri, January 6-8, 1909.

PLANT PHYSIOLOGY. A large number of studies on the vital activities and processes of plants were published during 1909. The question of light perception by plants has been a subject of controversy, the perceptive power of certain epidermal cells being affirmed and denied. Bose has contended that impulse travels through the fibrovascular bundles of plants, but many investigators hold that the power of transmission of excitation is a function possessed by all tissues where there is continuity of protoplasm. Weisner finds that finely divided leaves favor assimilation by the plant by increasing leaf surface and lowering temperature. The method by which the transpiration column in the plant is maintained is still in dispute. Dixon offers additional evidence against the so-called vital theory of the ascent of sap. Bergen has shown that plants growing in humid atmospheres acquire a greater capacity for transpiration than normal, and Smith in studies in the Tropics found a relationship between the temperature of leaves, their color, and transpiration. Young red leaves have the highest internal temperature and also the most rapid transpiration.

The studies on the constitution of chlorophyll are being continued by Stahl, Marchlewski, Hausmann, and others. Willstätter has recently shown that magnesium is a constant constituent of chlorophyll and that starch formation is in some way associated with the presence of magnesium. It seems well established that plants under certain conditions can derive their carbon from cultures in which they are grown and that formaldehyde gas in small quantities can be utilized by the leaves of plants. Euler claims that oxalic acid is an oxidation product of the plant and not an intermediate product of photosynthesis. Parkin has shown that in snowdrop leaves sucrose precedes hexoses in photosynthesis and not the converse. Palladin claims dextrose to be the initial product of carbon assimilation and that it is the parent material from which all aromatic compounds are formed.

The effect of temperature and other physical agencies on various vital functions has been investigated. Becquerel found that seed of wheat, mustard, and alfalfa would withstand drying, sealed in a vacuum, kept for 3 weeks at the temperature of liquid air and 77 hours in liquid hydrogen at -253° C., without losing their power of germination. Maksimov found mistletoe, pine needles, and spiraea buds to continue respiration at -20° C. Starch conversion in twigs of mulberry was favored at temperatures of 60 to 70° C. and ceased at 80°. Cloudy weather has been found to retard assimilation of wheat plants, four or five times as much carbon dioxide being assimilated during bright weather, with a corresponding increase in

starch. The estimated amount of starch formed in a field of wheat on a cloudy day was 7 kg. per hectare as compared with 33 kg. on a bright one. Reed has shown that potash salts are necessary for starch formation by plants, phosphorus is closely connected with carbohydrate transformation, calcium is needed for the activity of chlorophyll, and magnesium for the activity of the chloroplasts.

Root excretions have been studied by many, and Stoklaas and Ernst find that under normal conditions carbonic acid alone is excreted. If toxic properties are present they are the product of incomplete oxidation. Much attention has been given to the lime and magnesium ratio required by plants, and various proportions have been worked out for different crops. Studies on proteolytic and other ferments are being carried on by a number of investigators, and the presence of glucosids, enzymes, etc., in the plant world is found of very frequent occurrence. Freezing and anaesthetics have been found to liberate hydrocyanic acid from cyanogenic glucosids. That color in plants can be influenced and entirely changed by chemical agencies has been shown by Kraemer, Bunyan, and others. Combes found that anthocyanin, the red coloring matter of plants, is associated with an accumulation of starch and glucosids. The great lifting power of plants is shown by Stone, who found fronds of the ostrich fern lifting a cement walk, the power required being estimated at 361 gm. per square millimetre.

PLANT PATHOLOGY. A considerable number of plant troubles that have been attributed to fungus attacks are now believed to be due to abnormal weather conditions, and the investigations of Morse, Clinton, Stone, Graebner, and others seem to substantiate their claims. A number of epidemics of tree diseases seem to have followed winters of unusual severity, and it is probable that the injury was primarily due to the freezing. This is particularly true of white pine blight, which appeared in New England.

The perfect stage of a number of fungi has been reported during the year, among them the leaf spot fungus of pears and quinces, the cotton anthracnose, the fungi causing the rots of stone fruits, potato rot, etc. A number of investigators have shown the influence of the medium on the variation of fungi and have suggested the application of cultural methods as a means for identifying fungi. Considerable data have been added regarding the susceptibility of different varieties of plants to disease, and the causes of resistance are receiving attention. Structural differences, enzymes, chemical stimulus, etc., have each been suggested as the basis of immunity. It has recently been shown that wheats immune to rust in India have been badly attacked when planted in southern Africa. Münch has found that about 12 per cent. of water in excess of the normal winter content is necessary for the development of fungi in structural timber. The presence of the potato rot fungus (*Phytophthora infestans*) has been shown to increase the glucose content of the tubers to fully double the normal amount.

A number of diseases new to the United States have been described or reported for the first time. These include a bacterial leaf disease of oats and other cereals; a muskmelon wilt due to *Mycosphaerella citrullina*; a necrosis of grapevine caused by *Fusicoccum viticolum*;

a disease of apples and pears in North Carolina due to *Hypochnus ochroleucus*, a fungus hitherto known only from Brazil; a bacterial disease of lettuce; a leaf spot (*Alternaria dianthi*) of carnations; and anthracnose of figs (*Colletotrichum caricae*). Among diseases common in Europe, some of them very destructive, which were reported in America for the first time are the black scab of potatoes (*Chrysophyloctis endobiotica*); the white pine blister blight (*Peridermium strobi*); the crown gall of alfalfa (*Urophlyctis alfalfa*); the silver leaf disease of plums, cherries, etc.; and the nematode disease of wheat due to *Tylenchus tritici*.

Considerable interest has been aroused by studies carried on at the Illinois, Nebraska, and North Carolina experiment stations on the cause of mouldy corn. The fungus *Diplodia zeæ* seems commonly associated with it, and E. F. Smith suggests a possible connection between this fungus on corn and the cornstalk disease of cattle and pellagra in man.

In Europe, aside from the commonly known plant diseases whose control is being investigated, considerable uneasiness has been caused by epidemics of oak mildew in France and Italy; leaf curl of potatoes in Germany; black scab of potatoes due to *Chrysophyloctis endobiotica* in Germany, England, and elsewhere. This is probably one of the most destructive potato diseases observed in recent years. It is claimed that this and the leaf curl disease reduced the potato crop of Germany by 50 per cent. in 1908. The American gooseberry mildew is still giving much concern in northern Europe, where it seems quite destructive.

Freeman and Johnson have shown that the loose smuts of wheat and barley may be controlled by soaking the seed grain in cold water for five hours and hot water (52-54° C.) for ten to fifteen minutes. Similar results were obtained in Germany by drying the grain in air heated to 60-65° C. The possibility of controlling grape black rot by spraying with Bordeaux mixture has been fully demonstrated in spraying experiments conducted in New York, Pennsylvania, Michigan, and elsewhere. A Bordeaux mixture consisting of four pounds of copper sulphate, three pounds of lime, and fifty gallons of water gave the best results. The long term experiments of the New York and Vermont experiment stations on spraying potatoes have been continued, and as a result of eighteen years' experiments, annual gains averaging 92 per cent. of the crop have been reported in Vermont due to thorough spraying.

Studies are being made by a number of investigators in this country and in Europe on the constitution of Bordeaux mixture. A number of new fungicides were tested in different countries and their true value determined. Few were found to equal Bordeaux mixture in efficiency. Studies in Italy, England, and elsewhere indicate that the amount of copper sulphate in Bordeaux mixture may be considerably reduced from the quantity usually called for by the formulas without diminishing its efficiency as a fungicide. The lime-sulphur mixture originally employed against the San José scale has been found to have marked fungicidal properties and many trials were made with it during the year.

LITERATURE. A number of important contributions to botanical literature appeared during

1909, among them a *Manual of the Rocky Mountain Region*, by J. M. Coulter and Aven Nelson; a *History of Botany*, 1860-1900, by J. Reynolds Green, supplementing Sach's *History of Botany*, 1530-1860; an English edition of Warming's *Ecology of plants*; the fourth and fifth volumes on *Trees*, by Marshall Ward; *Zur Biologie des Chlorophylls*, by Stahl; *Die Chemie des Chlorophylls*, by Marchlewski; *Fungus Diseases of Plants*, by Duggar; *Maladies des plantes Cultivées*, by Delacroix and Maublanc; *Les Ennemis des Arbres Fruitiers et des plantes cultivées*, by Vermorel; Lindau and Sydow completed their bibliography of mycological literature, nearly 30,000 titles being listed; Hollrung's annual summary of the literature of plant diseases; *Agricultural Bacteriology*, by Conn; *Bacteria in Relation to Country Life*, by Lipman, etc. A new journal, *Mycologia*, was established by the New York Botanical Garden as a continuation of the *Journal of Mycology*, edited by the late Dr. Kellerman.

BOWDOIN COLLEGE. An institution of higher learning at Brunswick, Me., founded in 1794. There were in 1909 345 students and 25 members of the faculty. This was the largest attendance in the history of the college. There were received in gifts during the year \$524,552.18. A number of important changes were made in the faculty, Professor Roscoe J. Ham was elected professor of German, and Henry Pratt Fairchild was elected Fayerweather professor of economics and sociology. There are 94,511 books in the library. The productive funds amount to \$1,379,894 and the total income is about \$100,000 a year. The President is Rev. William De Witt Hyde.

BOWLING. The ninth annual tournament of the American Bowling Congress was held at Pittsburg in March. The individual championship was won by L. Sutton, of Rochester. Sutton and F. Bruggeman, of Sioux Falls, Ia., tied with a total of 691 for three games, and in the one game play-off, Sutton scored 215 against Bruggeman's 179. The two-men team contest was won by the Schwaebler Brothers, of Madison, Wis., who rolled 1304. In the five-men team event the Lipmans, of Chicago, were successful, with a score of 2962 pins. This is a world's record. The all events (nine games) championship went to James Blouin, of Cleveland, O., who made a total of 1885. The third annual tournament of the National Bowling Association took place in Madison Square Garden, New York, May 24 to June 12. The winners and scores were: Individual, E. Thompson, Brooklyn, 699; two-men team, Satterthwaite-Rodgers, Philadelphia, 1298; five-men team, Corinthian No. 8, New York, 2899.

BOXING. The Amateur Athletic Union held its annual boxing championships at Boston, April 12-13. The results of the final bouts were: 105-pound class, Arthur Souza, of Cambridge, defeated "Teddy" Murphy, of South Boston; 115-pound class, Joe Gorman, of Northboro, defeated Arthur Kane, of Cambridge; 125-pound class, T. F. Fitzpatrick, of South Boston, defeated K. Jewett, of Boston; 135-pound class, "Larry" Shelvin, U. S. S. *New Jersey*, of Roxbury, Mass., defeated John Morris, of East Boston; 145-pound class, M. J. McNamara, of Cambridge, defeated C. Anderson, of South Boston; 158-pound class, "Dan" Sullivan, of Cambridge, defeated J. Bely, Jr., of Waltham;

heavy-weight, "Phil" Schlossberg, U. S. S. *New Jersey*, defeated Emory Payne, of New York.

In professional pugilistic circles the most important event of 1909 was the signing of articles by "Jack" Johnson and James J. Jeffries, in which these fighters agreed to box 45 rounds or more on July 4, 1910, in California, Nevada or Utah. The purse offered for the fight, \$101,000, will be the largest ever fought for. The principal professional bout of 1909 was the contest between "Jack" Johnson and Stanley Ketchel for the heavy-weight title. The fight was held in San Francisco, Johnson knocking out Ketchel in 12 rounds. Another title bout was that between Nick Hyland and Battling Nelson, the lightweight champion, which was won by Nelson in the twenty-third round. The English Amateur boxing championships were held at London, April 7-8. The winners at the various weights were: light, A. J. Lambert; middle, W. Child and heavy, C. Brown.

BOYCOTT. In the case of Loewe v. Lawlor, known as the Danbury Hatters' case, the Supreme Court of the United States had, in 1908, declared a boycott to be illegal under the Sherman Anti-Trust law. In that case the complainant had claimed that he had suffered damages to the extent of \$80,000 as a result of the boycott. The court therefore authorized him to bring suit under that clause of the Sherman act which provides for the recovery of three-fold the damages from any combination in restraint of trades. Accordingly suit was brought in the United States Circuit Court in Connecticut by Loewe, the hat manufacturer, against the Hatters' Union for the recovery of \$240,000. Depositions were taken in numerous parts of the country and the case did not come before the jury until October 11, 1909. The case had not been concluded at the end of the year.

The suits growing out of the injunction secured by the Bucks Stove and Range Company against the American Federation of Labor (see INJUNCTIONS) hinged largely on the definition of a boycott, consequently the efforts of the judges in this famous case to define the boycott have permanent value. Justice Van Orsdel, who concurred in the modified injunction, as decreed by the Court of Appeals of the District of Columbia, March 11, 1909, defined a primary or direct boycott and a secondary boycott, approved the former and condemned the latter. He declared that any man or any number of men have an undoubted right individually to conclude not to patronize a certain firm. "It is also," he said, "the right of these men to agree together, and to advise others, not to extend such patronage. That advice may be given by direct communication or through the medium of the press, so long as it is neither in the nature of coercion or a threat." He, however, condemned the secondary boycott, that is, a conspiracy to injure the property rights of another, such conspiracy being carried out by threats and coercion. The offense thus consists only in coercing others against their will to refuse to extend their patronage.

At the same time, Chief Justice Shephard, who did not concur in the modified injunction, declared in somewhat similar language that the injunction "should be modified so as to restrain the acts only by which other persons have been or may be coerced into ceasing from business

relations with the Bucks Stove and Range Company." He held that one person or any number of persons may refuse their patronage, and may agree among themselves so to do; that, therefore, the American Federation of Labor has a legal right not to extend its patronage; and that "refusing to purchase those goods does not constitute a boycott in the legal sense." From these citations it appears that though the two justices agreed in condemning a secondary boycott, they did not agree as to whether a boycott actually existed in the case before them.

The American Federation of Labor contended that as no coercion or threatening had been exercised, no boycott in the legal sense existed, and therefore the order restraining it was not based on the facts. At its annual convention in Toronto, the Federation, with every show of enthusiasm, indorsed the report of its committee on boycott, which declared strongly for the use of the boycott as a measure of industrial warfare, when more peaceful means have failed to prevent oppression and injustice.

BOYÈ, MARTIN HANS. An American chemist and geologist, born in Copenhagen, Denmark, in 1812. He was educated in Denmark, and in the medical department of the University of Pennsylvania, graduating in 1844. In 1841 he jointly discovered the compound chloride of platinum with binoxide of nitrogen. From 1842 to 1845 he conducted a laboratory for instruction and analysis in analytical and practical chemistry. He was professor of chemistry in the Central High School, Philadelphia, from 1845 to 1859, retiring in the latter year. He made many valuable discoveries in the refinement of cottonseed oil. Dr. Boyè was a voluminous writer on chemical and geological subjects. Among his works are *Pneumatics, or the Physics of Gases* (1856); *Chemistry, or the Physics of Atoms* (1857). He contributed many papers and monographs to scientific journals.

BRANDY. See LIQUORS, FERMENTED AND DISTILLED.

BRAUN, FERDINAND K. A German physicist, who shared with William Marconi (q. v.) the Nobel prize for physics, awarded on December 9, 1909. He was born in Fulda, in 1850, and was educated at the Universities of Marburg and Berlin. In 1876 he became a professor of theoretical physics in the University of Marburg; in 1880 he was chosen to a similar position by the University of Strassburg, and in 1883 was chosen professor of physics in the Technical High School at Carlsruhe. In 1885 he went to the University of Tübingen, remaining there until 1888. In 1885 he was appointed professor of physics at the University of Strassburg. He has conducted investigations into the nature of elasticity in matter and the relations of chemical energy to electricity. He has also made inventions in the use of the cathode rays and contributed to the use of the ultra-microscope.

BRAZIL, UNITED STATES OF. The largest republic of South America, occupying the central and eastern part of the continent. The capital is Rio de Janeiro.

AREA AND POPULATION. The estimated area of the 20 states and Federal District comprising Brazil in 1900 was 3,218,139 square miles, and the population, according to the census of that

year, was 17,318,556. By treaty of November 17, 1903, Brazil acquired from Bolivia for about \$9,757,000 the Acre Territory, which has an area of about 73,720 square miles and an estimated population of over 70,000. The estimated population of Brazil in 1908 was 20,515,000, including some 600,000 uncivilized Indians. The most densely inhabited states (exclusive of the Federal District) are Rio de Janeiro, Alagoas, Paraná, Sergipe, and Ceará. The population of the larger cities is: Rio de Janeiro (1908), 858,000; São Paulo (1907), 274,000; Bahia, 230,000; Pernambuco, 120,000; Pará, 100,000. See EXPLORATION.

Immigration in 1907 was 87,786, and in 1908, 94,695, Brazil being the only American country showing an increase in the latter year. Most of the immigrants were established in the 26 "nucleus" colonies, of which 11 belong to the Federal government and the remainder to the states. Of the total in 1908, 37,628 were Portuguese, 14,862 Spaniards, 13,873 Italians, 5781 Russians, 5317 Austro-Hungarians, 2931 Germans. Immigration during the first five months of 1909 was greater than during the same period of 1908. Of the total immigration the state of São Paulo receives over 40 per cent. The recent experiment of introducing Japanese labor on the rice and coffee plantations proved unsuccessful, most of the Japanese having left the plantations and drifted to the cities.

EDUCATION. Education, which is not compulsory, is in a backward condition. Figures relating to the beginning of 1908 have been reported as follows: Pupils enrolled at the various public and private educational institutions of the country, 624,024; 11,216 primary schools, with 569,372 pupils; 328 secondary schools, with 30,897 pupils; 25 institutions of higher education, with 5829 students; 116 professional schools, with 17,966; 44 normal and pedagogical schools, with 5021; 25 industrial schools, with 7334; 9 commercial schools, with 736; 3 agricultural schools, with 166. Enrollment in the medical schools was 2905 and in the law schools, 2451. Roman Catholicism is the prevailing religion, but ecclesiastical equality obtains.

AGRICULTURE. Though only a small part of the country is under cultivation, the principal industry is agriculture. Coffee, the chief crop, is grown especially in the state of São Paulo, which furnishes about four-fifths of the world's production. Other important products are rubber, cacao, sugar, tobacco, corn, rice, and other cereals, cotton, yerba mate, beans, fruits, and nuts. The state government of São Paulo is making vigorous efforts to maintain the price of coffee. It has enacted a law imposing from October 1, 1908, an additional duty of 20 per cent. ad valorem on coffee exports from the state exceeding 9,000,000 bags (of 60 kilos) in the year ending July 1, 1909, 9,500,000 bags in that ending July 1, 1910, and 10,000,000 bags in that ending July 1, 1911. The state has arranged to issue a loan of £15,000,000, the proceeds to be applied to operations for the protection of coffee, and it is carrying on a propaganda in Great Britain and the British colonies for encouraging coffee consumption. The coffee crop for the season of 1907 was nearly 20,000,000 bags; for 1908, somewhat over 10,000,000 bags; for 1909, over 12,000,000 bags. The great bulk of these crops was grown in São Paulo. In 1908 Brazil took first rank as a producer of cacao, the crop amounting to nearly 70,000,000 pounds,

against 54,000,000 pounds in 1907; the estimated crop for 1909 was 72,000,000 pounds. About four-fifths of the cacao is produced in Bahia. Rice culture is extending; a few years ago rice imports amounted to over 2,000,000 bags annually and now have almost entirely ceased. Sugar culture is one of the oldest of Brazil's industries; its centre is the state of Pernambuco, which is credited with about half the total annual yield. The sugar production of the state in 1908 was 130,000 tons and for 1909 was estimated at 210,000 tons. Tobacco is raised chiefly in Bahia. Recently the production of yerba maté has increased. The government pays bounties to the producers of silk cocoons, and a law of December 31, 1908, authorized the payment of bounties to agricultural syndicates engaging in wheat cultivation. See IRRIGATION.

STOCK RAISING. Cattle-raising is an important industry, especially in Rio Grande do Sul, Matto Grosso, Minas Geraes, and Goyaz. The number of cattle in Brazil is not known, but an estimate places it at 25,000,000. In Matto Grosso large herds of cattle run wild, with less attention than was given stock in the early ranch days of the Western United States. In Rio Grande do Sul, where the most important of the jerked beef establishments are situated, about 625,000 beeves are slaughtered annually for this class of meat; in Matto Grosso about 605,000 are slaughtered for the same purpose. The annual slaughter of cattle in Minas Geraes is 305,000; in the state of Rio de Janeiro and the Federal District, 225,000. Dairy products are most important in Minas Geraes. That state sends annually to the other Brazilian states dairy and pastoral products valued at about \$14,000,000. Sheep raising has proved profitable in Rio Grande do Sul, Paraná, Santa Catharina, São Paulo, and other parts of southern Brazil.

MINERAL RESOURCES. Brazil's mineral resources are known to be considerable, but very little progress has been made in their development. As in other South American countries, exploitation is hindered by lack of adequate means of transportation. Mining at present is carried on chiefly in the state of Bahia, and its products include gold, diamonds, monazite (of which the greater part of the world's supply comes from Brazil), manganese, and mercury. Small quantities of copper, mica, talc, and agate are also produced; and coal is mined in Rio Grande do Sul and Santa Catharina. Petroleum exists in workable quantities. Recent official surveys show that Brazil has enormous, perhaps the largest, iron ore deposits in the world.

MANUFACTURES. In 1909 there were reported 3258 factories, employing 151,841 operatives and having a capital of \$199,672,200, and an annual production valued at \$222,459,900. These "factories" include some establishments which in the United States would be regarded as commercial rather than industrial. About one-fourth of the foregoing figures apply to the state of Rio de Janeiro and the Federal District. About 52 per cent. of the number of factories and more than that proportion of the number of employees are in the states of Rio de Janeiro, São Paulo, Minas Geraes, and the Federal District, all represented by the ports of Rio de Janeiro and Santos; and about 95 per cent. of the number of factories and a larger proportion of the capitalization and employees are on seacoast states. In the Federal District

the capital invested was \$50,996,700; in São Paulo, \$38,310,600; in Rio de Janeiro (state) \$25,858,500; in Pernambuco (state), \$17,617,200; in Rio Grande do Sul, \$14,761,800. The capital invested and the annual output in the principal branches of manufacturing were, respectively: Textile mills (194 in number), \$80,511,300 and \$51,333,300; sugar factories, \$22,218,600 and \$20,177,100; breweries, \$8,286,800 and \$6,805,800; foundries, \$6,889,200 and \$9,487,500; match factories, \$5,118,000 and \$6,382,500; flour mills, \$4,924,800 and \$11,807,700; soap and candle factories, \$4,543,800 and \$6,612,000; saw and planing mills, \$4,346,400 and \$9,413,700; yerba maté plants, \$4,275,000 and \$6,771,900; tobacco factories, \$3,885,300 and \$6,095,700; lime and cement works, \$3,377,700 and \$1,492,800; potteries, \$3,164,100 and \$3,108,900; sugar refineries, \$3,131,400 and \$4,624,200; hat factories, \$3,125,100 and \$4,615,200; shoe factories, \$3,036,100 and \$8,818,100; tanneries, \$2,845,500 and \$4,527,300; salt factories, \$2,838,300 and \$937,800; manufactures of railway material, etc., \$2,528,700 and \$3,304,200; bottling establishments, \$1,989,300 and \$2,763,600; chemical manufactures, \$1,950,600 and \$3,063,600; dried meat plants, \$1,883,100 and \$11,630,700. Of the 194 textile establishments, 161, with 46,000 operatives, \$70,328,400 capital, and \$40,507,800 annual production, are cotton factories. Jute factories, with 3489 employees, had a capital of \$4,740,000 and an annual output of \$6,717,000; the proportionately large output of jute products is due to the demand for coffee bags. Woolen factories, with 1957 employees, had a capital of \$4,454,000 and an annual output of \$3,412,500. Silk factories, with 244 employees, had a capital of \$289,500 and an annual output of \$312,600. Although Brazil has one of the greatest deposits of fairly high-grade iron ore in the world, only about 3.5 per cent. of its manufactures relate to iron or articles thereof and such establishments use imported material. This condition is due to lack of fuel, inadequacy of internal transportation facilities, and lack of talent in the iron-working trades; but the government has undertaken to secure the investment of foreign capital and the aid of foreign talent for developing iron manufacture.

FOREIGN COMMERCE. The values of imports and exports of merchandise have been as follows:

	1906	1907	1908
Imports	\$161,587,465	\$197,227,579	\$172,718,946
Exports	268,389,104	263,651,874	214,588,278

The leading imports are cotton textiles, coal, wheat, flour, wines, wheat, jerked beef, railway material, and codfish. For 1907 and 1908 the values of coal imports were \$10,004,213 and \$9,719,334 respectively; of briquettes \$1,138,286 and \$871,798 respectively. The imports of flour in 1907 amounted to 170,252,996 kilos, valued at \$9,508,861; in 1908, 151,076,077 kilos, valued at \$8,884,260; in the former year 126,379,414 kilos came from Argentina, and in the latter 112,074,753 kilos. Imports of condensed milk in 1907 reached the large total of \$715,441; in 1908, \$753,858.

Imports from and exports to the countries commercially most important were valued as follows in 1907 and 1908:

Countries	Imports		Exports	
	1907	1908	1907	1908
Great Britain	\$59,073,835	\$49,757,846	\$42,077,661	\$31,738,778
Germany	30,221,171	25,654,640	45,084,631	33,894,423
United States	25,139,390	20,918,273	84,721,265	86,170,788
Argentina	17,645,245	17,500,936	8,552,187	9,028,190
France	18,009,320	15,568,308	35,020,373	16,429,308
Portugal	11,447,385	8,936,880	1,824,186	944,753
Belgium	7,822,136	8,063,567	14,240,398	4,785,875
Italy	6,975,280	5,862,303	1,531,614	2,457,000
Uruguay	5,476,962	5,328,501	3,616,206	3,920,623
Austria-Hungary	3,296,324	2,765,564	7,425,934	8,897,766
Netherlands	1,116,930	939,000	10,363,487	9,882,479

During 1908 Brazil suffered a general business depression. For the first six months of 1909 imports were valued at \$82,280,714, as compared with \$90,304,852 during the corresponding period of 1908; the exports amounted to \$114,329,935, as against \$91,455,731 during the first six months of 1908. The advance in export values was mainly due to a rapid rise in the price of rubber. For the first eight months of 1909 imports and exports were valued at \$113,798,421 and \$162,638,318 respectively, as compared with \$117,414,295 and \$123,646,848 respectively in the January-August period of 1908.

SHIPPING. The reported entrances of oversea shipping at Brazilian ports in 1907 were 5415 vessels of 11,168,324 tons net; in 1908, 5474 vessels of 12,362,480 tons net. The greater part of this shipping was British, German, Brazilian and French. The British vessels in 1908 numbered 2199 with a tonnage of 6,124,347, the German 920 with 2,536,032, the Brazilian 556 with 473,552 and the French 404 with 1,017,848. In 1908, 349 Argentine vessels entered, 344 Italian, 148 Austro-Hungarian, 126 Norwegian, 77 Dutch. In 1907 there were 13 entrances of American vessels, of 12,972 tons; in 1908, 10 vessels, of 7356 tons; of the 10 vessels in 1908, only three were ships with cargo, and these were sailing vessels. To improve shipping facilities extensive harbor works were under construction in 1909 at various ports, including Pernambuco, Rio Grande, Rio de Janeiro, and Pará. The merchant marine in 1909 consisted of 224 steamers, of 120,672 tons, and 298 sailing vessels, of 62,613 tons.

COMMUNICATIONS. At the end of 1908 the total length of railways was 11,572 miles, of which 633 miles were constructed in that year. Of the new construction, 487 miles are owned by the Federal government, and 146 by the states. On the same date 2338 miles were under construction and 3473 miles projected and approved. In the following year railway building continued its comparatively rapid progress. The construction of the Madeira-Marmore Railway, which will connect the Marmore and Madeira rivers (passing around the falls which have hitherto made impracticable a direct commercial route from Bolivia to the Atlantic), was being pushed in 1909 as rapidly as possible. In the autumn of that year some 2700 men were engaged in the work, which the character and remoteness of the country render most difficult; at that time nearly 60 miles of the line were completed. On December 31, 1908, the telegraph wires actually in service aggregated 36,119 miles—including the Federal trunk line (18,207 miles), the railway telegraph lines, the state line in Rio Grande do Sul, the subfluvial cable up the Amazon, and the foreign cables

along the coasts. There are about 3000 post-offices.

FINANCE. Revenue for 1908 is stated at 105,098, 128 milreis gold and 346,266,260 milreis paper; expenditure, 97,815,712 gold and 348,933,272 paper. For 1909 the approved estimates were 97,900,636 milreis gold and 286,520,500 milreis paper for revenue, and 75,390,272 gold and 330,352,781 paper for expenditure. By far the bulk of the revenue is derived from import duties. For 1909 the larger items of estimated expenditure were: Finance, 37,153,928 milreis gold and 89,554,934 milreis paper; industry and communications, 9,039,915 gold and 89,621,369 paper; navy, 9,441,153 gold and 38,044,489 paper. The gold milreis is worth 54.6 cents; for several years the Brazilian government has succeeded in keeping the value of the paper milreis at practically 30 cents. On December 31, 1907, the consolidated foreign debt amounted to £72,133,457, the internal paper debt, to 526,235,537 milreis, the floating debt, to 67,218 milreis gold and 169,023,914 milreis paper. On that date the metallic money in circulation amounted to 9,054,158 milreis silver and only 114,600 milreis gold. The amount of paper money in circulation is being gradually reduced; at the end of February, 1908, it was 642,963,951 milreis; on March 31, 1909, 634,166,844 milreis.

The Bank of Brazil, reorganized under decree of December 30, 1905, with a capital of 70,000,000 milreis in 350,000 shares of 200 milreis, has a monopoly of the gold checks issued for payment of duties. Its reserve fund at the end of 1908 was 1,081,902 milreis, as against 413,888 milreis at the end of 1907, and its operations in 1908 amounted to 345,141,458 milreis, as compared with 274,248,013 milreis in 1907. The net revenues of the bank in 1908 showed an increase of more than 67 per cent. over those of 1907.

NAVY. The navy includes the following vessels: Three armored battleships of about 13,000 tons each, one armored battleship of 5700 tons; two armored coast-defense vessels, aggregating 6320 tons; five protected cruisers, aggregating 16,290 tons; four torpedo gunboats, of 3590 tons; one gunboat, of 800 tons; 10 torpedo destroyers, of 6500 tons; two school ships, of 4000 tons; 14 first-class torpedo boats.

ARMY. By the law of January 4, 1908, every citizen of Brazil is liable for military service from his 21st to 44th year. This service is divided as follows: 1st line, two years in the ranks, seven years in the reserve; 2nd line, three years in the first line and four in the second; 3rd line, four years in the national guard and four in the reserve. The reservists of the first line are liable for manœuvres every year for four weeks, and those of the second line for

training annually for three or four weeks. The reorganization of the Brazilian army provided for the formation of the infantry into 15 regiments of 3 battalions of 3 companies each, and 12 battalions of chasseurs, each battalion having a machine gun section with 3 guns. Of cavalry there are 3 brigades of 3 regiments each, and 3 independent regiments, all of 4 squadrons. There are 5 regiments of 2 squadrons of divisional cavalry and 12 sections of scouts. There are 5 regiments of field artillery each of 3 divisions of 3 4-gun batteries; 5 6-gun howitzer batteries; 3 divisions of horse artillery of 3 4-gun batteries, 2 divisions of mountain artillery of 3 4-gun batteries. The heavy artillery includes 3 regiments of 6 batteries, 6 battalions of 2 batteries, and 6 independent. In addition there were 5 battalions of engineers and 5 squadrons of train. Provision was made for organizing this force into a field army composed of about 50,000 combatants and organized into 5 brigades, each composed of 3 regiments of infantry (of 3 battalions each), with 1 chasseur battalion, a regiment of cavalry, a regiment of field artillery (9 batteries) and 1 howitzer battery, a battalion of engineers and a squadron of train. In addition there would be 3 brigades of cavalry of 3 regiments each, and a division of horse artillery and the heavy field and mountain batteries. In 1908 the actual organization was composed as follows: General staff, 28; engineer staff, 68; general staff corps, 124; medical staff, 163; artillery staff, 62; 6 regiments field artillery (24 batteries), 2412; 6 battalions fortress artillery (24 batteries), 1984; 2 battalions of engineers, 862; 14 cavalry regiments, 5670; 1 transport corps, 278; 40 infantry battalions, 17,840; making a total of 29,489.

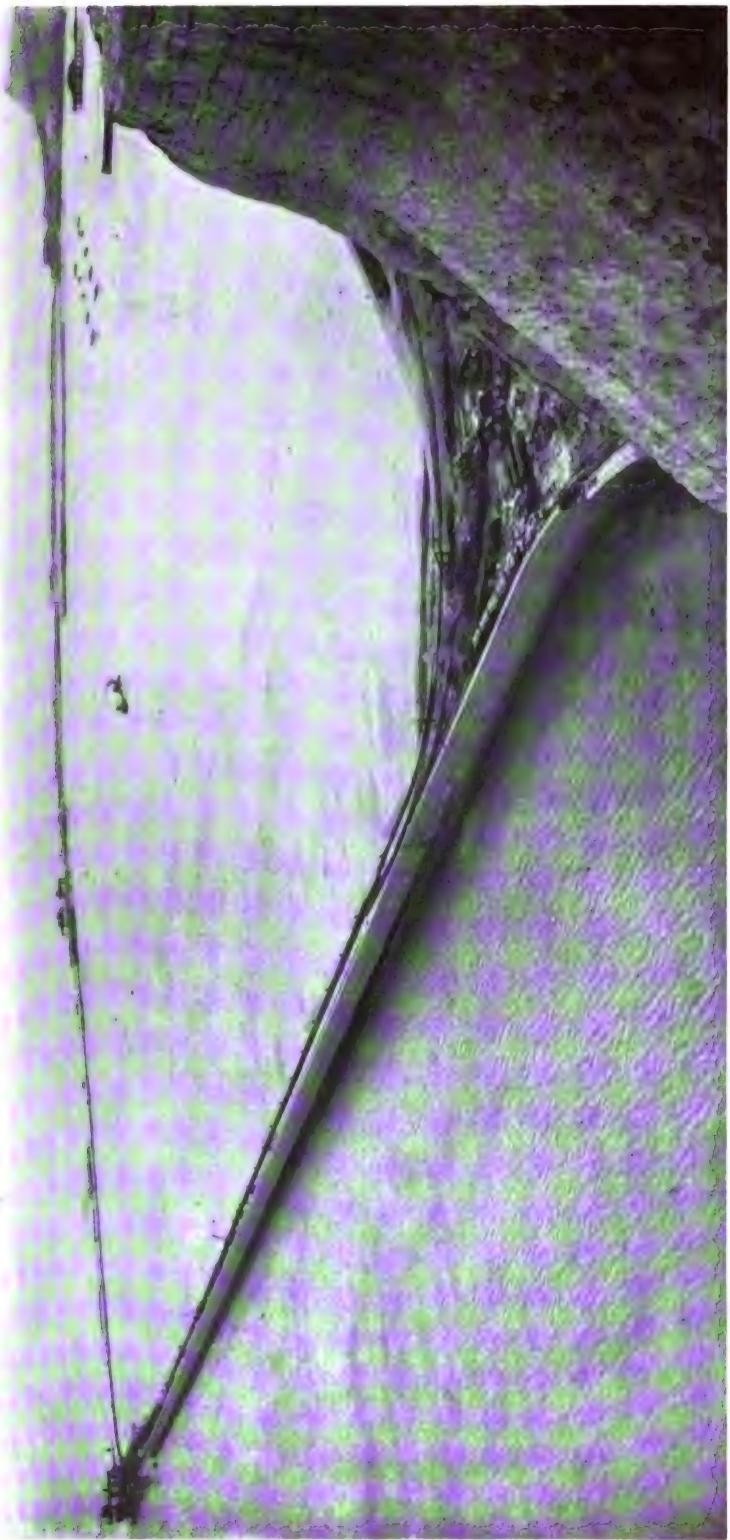

GOVERNMENT. Brazil is one of the five American republics which have the federal form of government, the others being the United States, Mexico, Argentina, and Venezuela. The executive authority is vested in a president, who is elected for a term of four years and is assisted by a cabinet of six ministers appointed by and responsible to himself. The legislative power devolves upon a congress of two houses, the Senate (63 members, elected for nine years) and the Chamber of Deputies (212 members, elected for three years). The President, Senators, and Deputies are chosen by direct vote. The President for the term beginning November 15, 1906, was Alfonso Augusto Moreira Penna; he died in June, 1909, and was succeeded on the 14th by the Vice-President, Nilo Pecanha. In matters not affecting the republic as a whole, the states are autonomous, having their own elected legislatures and governors.

HISTORY. The President's message to Congress was read on May 3. It announced that seven war ships would be launched under the new naval programme and that two-thirds of the amount required for this purpose had already been paid out of the ordinary revenues. The message referred to the great increase in immigration during the year, namely, forty per cent., and to the progress of railway construction. President Penna (q. v.), died on June 14, and was succeeded by Vice-President Pecanha. An arbitration with Great Britain was signed on June 18. A serious disturbance occurred in Rio de Janeiro in the tramway Light and Power Company, with

the result that for the time being the city was left in darkness and 25,000 were out of employment. The policy of the administration was one of retrenchment. Unnecessary expenses were cut down and measures involving unnecessary outlay were vetoed. The government sought to encourage the iron industry and the development of water power. It was announced in August that the President would undertake the reform of the Central Railway and the post-office. The former had not paid, but on the contrary had cost the government a large amount, being regarded rather as a means of employment to workmen than as a paying enterprise. The means proposed for the encouragement of the iron industry were its exemption from taxation and the levying of an import duty. In October tenders were invited on the rental of the port of Rio Janeiro.

BREAKWATERS. An important project involving massive breakwaters was the naval harbor at Dover, England, which was completed during the year and marked an important step in the development of this port. The work had been in progress for some twelve years and has involved an outlay of \$20,000,000. The new naval harbor formally opened by the Prince of Wales in October takes in an area of 610 acres and work was begun on the new commercial harbor and the railway station for cross-Channel traffic. This involved the reclamation of a large area of the foreshore east of the Admiralty pier. The breakwaters and protection arms and piers forming this large artificial harbor have an aggregate length of 11,154 feet or over two miles. These breakwaters were formed by massive concrete blocks weighing from 26 to 40 tons, deposited on the sea bed from a timber staging. They were set by the aid of diving-bells on the sea bed, which was first excavated and cleared. On the deepest section the depth of water encountered ranged from 47 to 53 feet below low spring tide. The width of the structures at foundation level varied from 52 to 57 feet, and at deck level from 40 to 47½ feet, in all cases the height of the dock above high water spring tides being 10 feet. As the foot of the breakwater on its outer side was exposed to severe scour and tidal action, it was protected by a masonry apron about 25 feet in width, built up of concrete blocks. The construction of these breakwaters formed one of the largest pieces of sub-aqueous masonry ever attempted and the prosecution of the work has been attended with success. There is formed a large and commodious harbor with a depth from 40 to 43 feet at low spring tides at the entrances and plenty of anchorage space for the largest war vessels. Designed chiefly as a rendezvous for the Channel fleet, it has great strategic importance.

A rubble mound breakwater 10,000 feet in length was in course of construction at Hilo, in the Island of Hawaii, to protect shipping in the harbor from the heavy seas that sweep from the northeast. The harbor, which is a deep open roadstead, is protected to a limited extent by Blonde reef on which the breakwater was being built. On July 1, 1909, 766 feet of complete breakwater had been constructed. It is estimated that by the middle of 1910 a length of some 3000 feet would be in position. The material used for construction was a basalt rock resembling heavy granite, which was quarried some 25 miles away, and transported to

the works. According to the specifications, from a depth of 3 feet below the water-line to the top, bowlders of not less than 8 tons in weight were to be used. The contractors believed that the rock employed, which weighed 160 pounds to the cubic foot, would, without the use of cement, resist any action of the waves.

BREEDING OF ANIMALS. See STOCK RAISING.

BREEDING OF PLANTS. See BOTANY.

BRETHREN, CHURCH OF THE, also known as DUNKERS or DUNKARDS. It forms a considerable body of Christians, whose faith and practice are not generally known outside of the localities in which they live. They originated at Schwarzenau, Germany, in 1708, with Alexander Mack as their leader. They were driven by persecution to the United States and made their first settlement at Germantown, Pa. From thence they spread through various sections of the country. They recognize the New Testament as the rule of conduct, believe in the Trinity, hold faith, repentance and baptism by triple immersion as conditions of pardon and membership. They observe foot-washing as a religious rite, followed by an evening meal, which they call the Lord's Supper. The Eucharist is a separate service following the Supper. Their mode of greeting is the kiss of love. They take no part in war, dress plainly, live simply, and are generally well-to-do. There are three groups of the denomination,—the Conservatives, Progressives, and Old Orders. The Conservatives are the most numerous and number about 100,000, having 900 congregations and over 3000 ministers, ten colleges and one of the largest denominational printing houses in the West, known as the Brethren Publishing House at Elgin, Ill. *The Gospel Messenger* is their organ. The Brethren have missions in Denmark, Sweden, France, Switzerland, Asia Minor, India and China. The latter was opened in the fall of 1908. At the General Conference, held at Des Moines, Iowa, in 1908, the change of the organization from "German Baptist Brethren" to "Church of the Brethren" was made. "Dunker" is a name that is not recognized within the denomination. The next General Conference will be held at Winona Lake, Ind., beginning June 7, 1910. The Progressive Brethren number about 17,000, and the Old Order 4000. The former have a college and publishing house at Ashland, Ohio. The Progressive Brethren opened up mission work in Argentina in the fall of 1909. The small body known as the Seventh Day German Baptists is now nearly extinct. The few members who are left, live in the vicinity of Ephrata, Pa.

BRIAND, ARISTIDE. A French public official, from July 23, 1909, Premier of France. He was born in Nantes in 1862 and was trained for the bar. He became identified with the Revolutionary Socialists, and was elected to represent that party in the Chamber of Deputies from the Loire. He early became distinguished for his ability, and in 1906 was delegated to report the bill providing for the separation of Church and State. His speeches and writings in favor of the measure gained for him much praise. For his services he was made Minister of Public Instruction and Worship. On December 31, 1907, he was made Minister of Justice, still retaining his former portfolio. For the cir-

cumstances leading to his election to the premiership, see FRANCE, under *History*.

BRIDGES. The completion of structures under way in 1908 rather than new undertakings of unusual magnitude characterized the year 1909 in bridge building. The changes recommended by the consulting engineers, when the design of the Queensboro Bridge, N. Y., was called into question, were made, and the bridge was formally opened and put into use. With the modification suggested the new structure was considered of far more than sufficient strength for its present use, and when traffic conditions of the future demanded its strengthening this could be arranged. The agitation over the Queensboro Bridge led to an examination of the new Manhattan Bridge which was nearing completion at the end of 1909 and though not quite ready for use was formally opened by Mayor McClellan late in December. This bridge is a suspension bridge with steel towers. The plans and the structure itself were examined by Ralph Modjeski, who had been retained as one of the consulting engineers to report upon a new Quebec Bridge. Mr. Modjeski's report was wholly favorable to the structure, it being pronounced "carefully designed, and when completed amply strong to carry the heaviest traffic which may be placed upon it in the near future, as well as any reasonable additional increase in the weight of properly regulated traffic it may be called upon to carry for many years to come." Not only superstructures but foundations and anchorages were thoroughly approved and the structure became a notable addition to the group of imposing structures spanning the East River, which, with the exception of the Forth Bridge, are the largest span bridges in the world.

The echoes of the discussion of the failure of the great Quebec Bridge in 1907 continued to be heard in 1909. After the disaster a commission appointed by the Canadian government, and consisting of Messrs. Maurice Fitzmaurice of London, Ralph Modjeski of Chicago, and H. E. Vantelet of Montreal, was engaged to prepare plans for a new bridge with somewhat higher headway than the old. The contracts for rebuilding the structure were let in December, 1909, and were awarded to the builders of the original piers for \$2,448,475. The site of the new bridge was the same, but the new north pier was to be moved 50 feet further out in the river, thus shortening the main span, which will be 1758 feet. The plans of the commission contemplated a cantilever design 88 feet in width and to contain 130,000,000 lbs. of steel as compared with 70,000,000 lbs. in the wrecked bridge. The estimated cost was \$7,500,000, but tenders for designs involving modifications of those prepared by the commission were invited, and it was understood that designs for a suspension bridge would also be considered. Few problems in the construction of bridges have received more attention than this one of the Quebec Bridge, and whatever the type of structure finally adopted it will represent the most conservative and enlightened judgment of American and European engineers.

During the year a new railway drawbridge was completed across the Willamette River just below Portland, Ore., for the Spokane-Portland Railroad. Its total length from opposite bank abutments is 1762 feet and the steel superstructure is supported by five massive reinforced con-

crete pillars faced with granite. The draw span is 521 feet from centre to centre of the end piers and it is claimed to be the longest draw span in the world, the great size being necessary on account of the large vessels passing up the river to Portland which has an extensive foreign trade. The cost of the new structure exceeded \$500,000 and over a year was required for its erection.

At the end of the year 1909, the new bridge of the Baltimore & Ohio, R. R. over the Susquehanna River at Aikin, Md., the erection of which was marked by the collapse of the false work on September 23 of the previous year, stood completed. The new bridge replaces a single track structure which consisted of three pier-connected spans with steel trusses and iron floor system over the river and a viaduct 1967 feet in length of plate girder spans on iron towers. For the new structure the old piers were employed and heavier double track river spans of substantially the same length were substituted. For the viaduct a structure with double track plate girders 90 feet in length and resting on concrete piers. The new bridge was constructed without disturbing traffic or interfering with the open passage for navigation.

Another notable bridge of the year was the four track reinforced-concrete structure carrying the main line of the Lake Shore & Michigan Southern Railway over the Grand River near Painesville, Ohio. It has an arch at the centre with a clear span of 160 feet and two end arches, each with a span of 69 feet $\frac{3}{4}$ inches, and replaced a four-arch stone masonry bridge, each arch of which had an 80 foot span.

A four-span concrete arch structure was built at Baltimore to carry Edmondson Avenue across Gwynn's Falls Valley and River and a branch of the Western Maryland Railroad. It is 542 feet in length, 76 feet wide, and 70 feet in height, carrying two trolley tracks, roadway and sidewalks. The main span is 139 feet in the clear and on one side is flanked by two approach spans of 60 feet and on the other one of the same dimensions.

A bridge 1004 feet in length was completed during the year across the Mississippi River at Fort Snelling, Minn. It is a steel deck structure with two three-hinged spans and braced arch spans of 364 and two 105 foot trussed deck spans.

On the Hopatcong-Slatford Low-Grade Cut-off of the Lackawanna Railroad a number of interesting concrete bridges were in course of erection. Among these the Delaware River Bridge is noteworthy as typical of modern railway bridge construction. It is about 1400 feet in length over all and consists of five 150 foot, two 120 foot, and two 33 foot arch spans, and contains some 50,000 cubic yards of concrete.

A notable bridge over the Gualegnay River in Entre Ríos, Argentina, was completed in the early part of the year 1909. The structure, in addition to its length, was interesting for the different types of pier construction employed. Masonry, brick, cylinder, and screw piles were all employed for the numerous piers, there being fifteen spans of 71 feet, one of 252 feet, twenty of 71 feet, followed by an embankment, and then eleven of 71 feet.

In England few important bridges were in course of erection during the year. A double-deck bridge to accommodate both railway and highway traffic was built over the Wear River

at Sunderland. This bridge is 1220 feet between abutments and is composed of three shore spans, each of 200 feet, and a main river span of 330 feet which is 85 feet above high water. The superstructure was erected on granite masonry piers and for the centre span was built out on the overhang principle in order not to interfere with traffic in the river. About 8500 tons of steel were required for the bridge, the total cost of which was approximately \$2,250,000. Another important British bridge undertaking was the widening of the Blackfriars Bridge, which was opened on September 17. This reconstruction gave a widened roadway and new space for electric car tracks. A similar improvement was demanded for the adjoining Southwark Bridge to accommodate the increased traffic and it was to be widened and the grades eased at an expense of about \$1,300,000. In addition it was determined to build a new bridge lower down on the Thames which was to be known as the St. Paul's Bridge and cost in the neighborhood of \$8,000,000.

During the year there was active discussion of a proposition for the construction of a railway bridge between the islands of Masnedo and Falster in Denmark, the decision resting between a bridge and a ferry. The plan proposed for the bridge involved a series of 275 foot spans with two 150 foot drawbridges. The work was planned to comprise a series of bridges and embankments alternately arranged in series with the following lengths, 575, 1100, 2800, 5850, 1000, and 410 feet. The estimated cost was \$2,625,000. In Austria a long railway bridge was in progress of construction across the Vistula at Marienwerder. This structure, erected on caisson foundations, was 3480 feet in length and consisted of five steel middle spans of 326 feet with approach arches. Another interesting bridge was the Fades Viaduct on the Paris-Orléans Railway crossing the Sioule gorge in the mountainous region of central France. The rail level is 445 feet above the river bed and the viaduct structure, 1525 feet in length, is carried on two central piers of masonry 303 feet in height above the foundation stone. The central span of 472 feet was flanked by two stone spans of 380 feet each and at one end there was a short approach span. The bridge was interesting for the great length of its centre span which was formed by continuous lattice girders. The bridge was opened in October after considerable delay due largely to difficulties with the foundations.

In Switzerland a somewhat similar problem of crossing a deep gorge was solved by a reinforced concrete arch at Letter in the Canton of Appenzell. This highway bridge had for its main span a 259 foot arch with 87 feet rise and was approached by several 33 foot 6 inch arches. The road carried is 22 feet 6 inches in width. Another example of reinforced concrete construction, though of quite a different type, was the long bridge or viaduct at Rotterdam on the line connecting that city with Scheveningen. This aggregated 5300 feet in length and consists of a number of arched spans of varying size depending upon street openings, etc. In Rome a ferro-concrete arched bridge to span the Tiber was begun and was being constructed with a 328 foot span and a width of 65 feet 7 inches. A notable bridge was completed on the new railway line between Piraeus and the Turkish frontier. This Assopus Viaduct crosses a deep gorge with a

THE MANHATTAN BRIDGE OVER THE EAST RIVER, NEW YORK CITY

steel arch of 262 foot span and 78 foot approach span and on the other five similar spans, the gorge being 600 feet in width and 330 feet deep.

From Africa progress was reported on the construction of the narrow gauge Sedan Railway bridge across the Blue Nile at Khartum and the work was nearing completion at the end of the year. The superstructure is supported by twenty steel cylinders 16 feet in diameter carried down to 60 feet below low water. In addition to small approach spans there are seven spans 218 feet 6 inches and an opening left affording a clear passage of 111 feet 9 inches. The bridge carries a double track, a 21 foot roadway and an 11 foot footway. On the White Nile 192 miles above Khartum, to carry the Sedan Railway to the Cordofan district, a bridge was also under erection consisting of nine 156 foot spans and a 245 foot 6 inch drawn span giving two clear passages of 100 feet. The superstructure was being erected on masonry piers built in caissons sunk by compressed air.

During 1909 in New Zealand there was opened for traffic an important railway bridge on the Auckland-Wellington line. This Markatole Viaduct has a maximum height of 260 feet and is a framed steel structure containing 1000 tons of steel. There are five 100 foot spans carried on piers 36 feet longitudinally and several approach spans. There was also completed at Grafton one of the largest masonry bridges in the Southern Hemisphere, 910 feet in length with a central arch of 320 feet span and 147 feet high.

BRISTOW, JOSEPH LITTLE. An American public official, United States Senator from Kansas. He was born in Wolf county, Kentucky, in 1861, and graduated from Baker University, Kansas, in 1886. From 1886 to 1890 he was clerk of the district court in Douglass county, Kansas, and from 1890 to 1895 he was owner and editor of the daily *Salina Republican*. In 1895 he purchased the Ottawa *Kansas Herald*. From 1895-97 he was private secretary of Governor Morrill of Kansas. He was secretary of the Republican State Committee of the State from 1894 to 1898. From 1897 to 1903 he acted as Fourth Assistant Postmaster-General. In 1900 he was given charge of the investigation of the Cuban postal frauds, and became a national figure as a result of charges which he made and substantiated against officials high in the postal service. On his retirement from office in 1903 he again purchased the daily *Salina Republican-Journal*. He was appointed by President Roosevelt special Panama railroad commissioner in 1905. Senator Bristow is the head of the radical element of his party in Kansas, and as such defeated for re-election to the Senate Chester E. Long, having obtained in 1908 a majority of the votes requisite for nomination in the primaries held in November. He was elected to the office by the legislature on January 26.

BRITISH ACADEMY FOR THE PROMOTION OF HISTORICAL, PHILOSOPHICAL AND PHILOLOGICAL STUDIES. A learned society incorporated by Royal charter in 1902. It aims at the promotion of the study of moral and political science, including history, philosophy, law, politics and economics, archaeology, and philology. The maximum number of ordinary fellows is fixed at 100. There were in 1909, 98, distributed under four main sectional committees: History and

Archaeology, chairman, Lord Reay; Philology, chairman, S. H. Butcher; Philosophy, chairman, Professor B. Rosenquet; Jurisprudence and Economics, chairman, Sir W. R. Anson. The President of the Academy is S. H. Butcher and the Secretary, Professor I. Goldencz.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. See ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, British.

BRITISH COLUMBIA. A province of Canada, extending from the Pacific Ocean to the Province of Alberta. The area is stated at 312,630 square miles. Population in 1901, 178,657, including 28,949 Indians (and half breeds) and 19,482 Chinese and Japanese. Exclusive of Indians and Asiatics, the estimated population in 1909 was 280,000. The capital is Victoria, with about 40,000 inhabitants; the largest city, Vancouver, with about 85,000. The average annual yield of the industries is: minerals, \$25,800,000; lumber, \$12,700,000; manufactures, \$12,000,000; fruit, farm products and fisheries, \$7,500,000 each. In 1907-8 imports and exports were valued at \$24,180,452 and \$23,941,187 respectively. In 1909 the reported length of railways was 1685 miles. In 1906-7 revenue and expenditure amounted to \$4,444,593 and \$2,849,479 respectively; in 1907-8 \$5,979,054 and \$4,590,673 respectively. The public debt in 1908 was \$4,226,818. For further statistical details, see CANADA. The province is administered by a lieutenant-governor, appointed by the Governor-General of Canada and acting through the Executive Council or responsible Ministry (seven members). The law-making power is vested in the unicameral Legislative Assembly (42 members, including the seven members of the Executive Council). In 1909 the Lieutenant-Governor was James Dunsmuir (since May 11, 1908), and the Premier (and Minister of Mines) was Richard McBride.

HISTORY. At the close of 1908 the situation as regarded the immigration of Asiatics had improved. It was evident that the Japanese were living up to the terms of their agreement. During the six months ending December 31 only 146 Japanese had come into the province, a considerably smaller number than were privileged to enter under the agreement between the Dominion and Japan. During the same period 972 Chinese and two East Indians entered. It was reported early in 1909 that feeling still ran high against Asiatic immigration, but no serious difficulty arose. Leading citizens in the country denied that they felt special hostility against the Japanese though they believed it essential to the interest of the province that precautions should be taken against any large influx of aliens. In February the Dominion government vetoed the immigration act imposing an educational test on the model of the Natal Act, which was passed by the British Colonial Legislature in 1908. This measure has been recently passed each year by the provincial legislature and always vetoed by the Dominion government. In July Premier McBride announced that the government would accede to the wishes of the Temperance Party and take a plebiscite on the question of local option. It was expected that the vote would be taken in the spring of 1910. Owing to a disagreement among the members of the government over the railway policy the Minister of

Finance and the Minister of Land and Works resigned in the latter part of October; but the November elections fully sustained the government. The returns were also favorable to the adoption of local option. At the end of November floods resulting from the heavy rains caused the loss of life of twenty Japanese laborers on the Great Northern Railway near Westminster. At the beginning of December the appointment of Mr. Thomas W. Patterson as Lieutenant-Governor to succeed Mr. Dunsmuir, resigned, was announced.

BRITISH EAST AFRICA PROTECTORATE. A dependency of Great Britain bordering on the Indian Ocean between the Juba and Umbo rivers (Italian Somaliland and German East Africa) and extending inland to the Uganda Protectorate. The capital is Nairobi. The estimated area is 177,100 square miles. The census has never been taken; the population has recently been estimated at 4,000,000, including about 25,000 Asiatics and 2000 Europeans and Eurasians. The Protectorate is divided into seven provinces: Seyidie, Ukaraba, Tanaland, Jubaland, Kenya, Naivasha, and Nyanza, whose centres of administration are respectively Mombasa, Nairobi, Lamu, Kismayu, Fort Hall, Naivasha, and Kisumu. The Protectorate also includes the Witu Protectorate, a small tract of country at the mouth of the Tana River. Witu is now regarded, for administrative purposes, as a part of Tanaland. There remains a considerable region within the boundaries of the Protectorate which has not been developed and which is not included in any province. Mombasa, which possesses perhaps the finest harbor on the east coast of Africa, has about 30,000 inhabitants; Nairobi, about 13,500. Agriculture, to which much of the country is admirably adapted, is only in the early stages of development; but it is fostered by the government, and the area under cultivation is extending. The products include rubber, corn, wheat, rice, barley, coffee, tobacco, and cotton. There is much grazing land, and the live-stock industry promises to become important. In 1907-8 imports and exports were valued at £799,717 and £515,052 respectively; in 1908-9, £797,158 and £436,313 respectively. The principal imports are rice, grain, flour, and other food-stuffs, cotton textiles, and building materials. The leading exports are ivory, copra, rubber, grain, wax, and hides and skins. The importation of arms and ammunition is prohibited, except under stringent regulations, and the introduction and local manufacture of spirits is largely checked. The Uganda Railway extends from Mombasa to Port Florence, on Victoria Nyanza, a distance of 584 miles; in connection with the railway steamers are operated on the lake. The construction cost of the railway, which is owned by the Protectorate, up to March 31, 1908, was £5,456,761. The shipping entered, chiefly at Mombasa, in 1908-9, amounted to 922,276 tons. The telegraph system of the Protectorate includes about 2300 miles of wire. For 1907-8 the revenue amounted to £474,760; expenditure, £691,677; grant-in-aid, £152,975, exclusive of £40,000 for the abolition of slavery. Of the revenue, the government railway was credited with £226,620. For 1908-9, the estimated revenue and expenditure were £533,439 and £803,638 respectively; grant-in-aid, £138,000. Administration is carried on under the British Colonial Office. The chief executive offi-

cer in the Protectorate is the Governor and Commander-in-Chief (Sir E. P. C. Girouard in 1909). In 1907 the title of "Commissioner" was changed to "Governor," and executive and legislative councils were established. Attention was centred on the country in 1909 on account of the Roosevelt hunting expedition and the articles and photographs published in connection with this and the reports of other travelers.

BRITISH GUIANA. A colony of Great Britain, lying to the east of Venezuela on the northeastern coast of South America. The capital is Georgetown. Estimated area, 90,277 square miles. Estimated population, December 31, 1904, 301,923, of whom about one-third were East Indians and over one-third negroes. Estimated population of the larger towns, Georgetown and New Amsterdam, on December 31, 1907, 47,867 and 9114 respectively. East Indian immigrants and emigrants in 1907-8 numbered 1855 and 1195 respectively. The birth rate in 1907 was 28.3, and the death rate 36.9, per thousand inhabitants. In 1908 there were 220 government-aided schools, with 30,888 pupils. The chief product is sugar (which forms 66 per cent. of the export trade), there being about 75,000 acres under sugar-cane out of the total of 90,000 acres under cultivation. The country is rich in gold, although in recent years the output has declined; the output in 1906-7 was valued at £311,740, and in 1907-8, £245,534. Imports and domestic exports in 1906-7 were valued at £1,890,804 and £1,659,280 respectively; in 1907-8, £1,765,358 and £1,545,303 respectively. The values of the leading imports in 1907-8 were: Textiles, £232,160; flour, £194,078; manures, £138,775; hardware, cutlery, and tools, £80,549; beef and pork, £58,570; oils, £58,394. The leading domestic exports in the same year were: Sugar, £1,004,025; raw gold, (65,717 ounces) £239,229; rum, £96,800; balata, £76,778; molasquit, £21,548; timber, £20,272; molasses, £4104; diamonds (1863 carats), £3026. Imports from and exports to Great Britain in 1907-8 were valued at £925,458 and £615,317 respectively; British possessions, £192,220 and £615,317 respectively. In the same year the total tonnage entered and cleared was 786,880. There are 94 miles of railway. Revenue and expenditure in 1906-7 amounted to £535,745 and £514,053 respectively; in 1907-8, revenue, £546,882, and expenditures, £517,706. Of the revenue in the latter year, £336,617 were derived from customs. The public debt on March 31, 1908, stood at £919,320. The colony is administered by a Governor (Sir Frederick Mitchell Hodgson in 1909), who is assisted by an Executive Council and by a Court of Policy (seven officials and eight elected members). The Court of Policy discharges the functions of a legislative council except in levying taxes, which is the prerogative of the Combined Court, composed of the Court of Policy, and six elected representatives.

BRITISH HONDURAS. A crown colony of Great Britain in Central America, on the Caribbean Sea. The capital is Belize (population 10,400). Area, about 7562 square miles. Estimated population in 1908, 43,270. The birth rate in 1907 was 36.622, and the death rate, 22.202, per thousand inhabitants. Of the births, 45.15 cent. were illegitimate. Primary schools (not including two receiving no government

aid) numbered 40 in 1907, with 4515 pupils enrolled. Secondary schools have about 300 pupils. The staple products are the natural woods of the country, principally mahogany and logwood. Other products include rubber, bananas, pineapples, oranges, mangoes, cocoanuts, sugar, and cacao. About 50,000 acres are under cultivation. Labor is scarce, and much food-stuff which could be raised in the country is imported. Imports and exports in 1907-8 were valued at \$2,415,723 and \$2,211,036 respectively; in the fiscal year 1909, \$2,676,723 and \$2,201,799 respectively. About one-half of the trade, both import and export, is with the United States, Great Britain ranking second. The chief domestic exports are mahogany and logwood (14,398,422 feet and 5744.5 tons respectively in 1908), bananas, cedar, and cocoanuts. Revenue and expenditure for 1907-8 amounted to \$395,183 and \$516,700 respectively; for the fiscal year 1909, \$360,914 and \$535,978 respectively. Over one-half of the revenue is levied from customs. The public debt in 1908 stood at \$168,815. The colony is administered by a Governor (Gen. E. J. E. Swayne in 1909), who is assisted by an executive and a legislative council.

The government as reconstituted in August, 1909, consists of a governor, an executive council and a legislative council of eight members, three official and five unofficial.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH KOWLOON. See HONG KONG.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A protectorate of Great Britain occupying the northern part of the island of Borneo. Estimated area, 31,106 square miles. Population, about 175,000, consisting mainly of Mohammedan settlers on the coast and aboriginal tribes inland, with some Chinese traders and artisans. The chief towns are Sandakan (population, about 8000, mainly Chinese) and Jesseton. A large area has been alienated by the government for the cultivation of tobacco, tapioca, sago, rubber, cocoanuts, and coffee. Other products are pepper, rice, gums, and woods. Most of the country is still in a primitive state. Various minerals are known to occur, but there has not been any exploitation of importance. In 1907 imports and exports were valued at 4,332,913 dollars (Mexican) and 2,921,100 dollars respectively; in 1908, 4,612,841 dollars and 2,754,788 dollars respectively. The chief export is tobacco, which amounted to 2,943,645 dollars in 1906, 2,459,122 in 1907, and 2,772,172 in 1908. There are 119 miles of railway in operation. Revenue and expenditure (exclusive of capital expenditure on railways and telegraphs) amounted to 1,139,554 dollars and 683,326 dollars respectively in 1907; in 1908, revenue 1,220,677, and expenditure, 748,584. The protectorate is under the jurisdiction of the British North Borneo Company. It is administered by a governor (E. P. Gueritz in 1909) in Borneo, whose appointment is subject to the approval of the British Colonial Secretary, and by a Court of Directors in London.

BRITISH SOMALILAND. A protectorate of Great Britain on the Gulf of Aden, between the French and Italian dependencies and bordering on Abyssinia. Estimated area, 68,000 square miles. The inhabitants, estimated at about 300,000 in number, are Somalis and Mohammedan and, except along the coast,

nomads. The principal towns are Berbera (about 30,000 inhabitants in the trading season), Zeila (15,000), and Bulhar (12,000). Imports and exports in 1907-8 amounted to £233,238 and £215,708 respectively; in 1908-9 £293,505 and £227,783 respectively. The principal imports are rice, textiles, and dates; the leading exports are hides and skins, ostrich feathers, cattle and sheep, and gums. There are over 300 miles of telegraph line. Revenue and expenditure in 1907-8 amounted to £28,607 and £105,201 respectively; grant-in-aid, £37,000. Since April 1, 1905, the administration has been carried on under the Colonial Office. The British Commissioner in the Protectorate, in 1909, was Capt. H. E. S. Cordeaux. In January it was decided to increase the number of British troops in the Protectorate on account of the depredations of the followers of the Somali Mullah. The subject came up for debate in Parliament on March 15, when the Conservatives cited it as an instance of the danger involved in a purely defensive policy. They declared that the trouble was likely to increase, the Mullah being a cruel despot who, unless promptly punished, would continue to kill the men and carry off the women in his raids. The British troops attacked the Mullah in May and regained possession of 600 camels that had been taken. Six British Somali soldiers were killed.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, BRITISH.

BRITISH WEST AFRICA. A collective name for the following British colonies and protectorates in Western Africa: Northern Nigeria, including the Protectorate; Southern Nigeria, including the Protectorate and the Colony of that name; Gold Coast Colony, including Ashanti and the Northern Territories; Sierra Leone, including the Colony and the Protectorate; and Gambia, including the Colony and the Protectorate (see these separate titles). In January, 1909, fighting was reported between the natives and the German escort to the Anglo-German Boundary Commission in the hinterland of Calabar. The German troops had been furnished to the Commission in return for the aid which the Cape Government had rendered on the German Southwest Africa frontier. The question of liquor traffic with the natives caused much concern, and the government appointed a committee in January to investigate the subject. In July it was announced that the British government would enter into negotiations with Germany, France, Belgium, Portugal and Spain with a view to increasing the duty on imported spirits into the West African Colonies and Protectorates, to restricting the entry of arms and ammunition into these colonies and to bringing about an international convention with regard to quarantine and like matters. The duty on imported spirits was at that time five francs per gallon. The Colonial Office sanctioned a special sanitary branch of the West Africa Medical Service, to consist of special sanitary officers, each under the chief medical officer of the Colony, who should be in regular communication with the Consultative Board sitting in London.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An educational institution of Brooklyn, New York City, incorporated in 1824 as the Brooklyn Apprentices' Library Associa-

tion, reincorporated in 1835 as the Brooklyn Institute and again incorporated in 1890 under the present title. The membership of the Institute on June 1, 1909, was 7032, an increase of 329 over the previous year. The receipts for the year 1908-9 were \$272,000. The permanent fund amounted on July 1, 1909, to \$399,554. During 1909 the down town work of the Institute was removed to the new Brooklyn Academy of Music, in which building the general educational work is carried on. The General Institute Museum contains art and scientific collections, the property of the Institute. During the year branches were established at Flushing and Garden City. A valuable addition was made to the art collections by the purchase of 83 water color paintings by John S. Sargent at a cost of \$19,514. An agreement was made with the State government for the establishment and maintenance of a botanic garden and arboretum in Institute Park. Daniel C. French and twelve sculptors associated with him during 1909 completed their work of creating thirty monolithic sculptures for the façade of the Museum. The attendance at the lectures of the Museum during the year was 258,275 and the attendance at other branches made a total attendance for the year of 594,686, an increase of nearly 100,000 over the attendance of 1908.

BROOKS, CHRISTOPHER PARKINSON. A technical educator, died August 4, 1909. He was born in Blackburn, England, in 1866, and was educated at Queen Elizabeth's School in Blackburn. From 1884 to 1895 he was connected with the textile department of several scientific schools in England, and was also managing director of English cotton mills. He organized and was director of the Lowell (Mass.) Textile School from 1896 to 1898, and in the latter year became managing director of the New Bedford Textile School, holding this position until 1904. He established in 1898 the American Correspondence School of Textiles and in 1899 he delivered a course of lectures in Boston. He wrote *Cotton Manufacturing* (1888); *Weaving Calculations* (1889); *Cotton, its Uses, Varieties, Fibre Structure and Cultivation* (1898). He also wrote many important technical articles on textiles.

BROTHERHOOD OF ST. ANDREW. See SAINT ANDREW, BROTHERHOOD OF.

BROUGH, LIONEL. An English comedian, died November 8, 1909. He was born in 1836 and began work as a clerk in the office of the editor of the *Illustrated London News*. He helped to publish the first issue of the London *Daily Telegraph*, and later was on the staff of the London *Star*. His first appearance as an actor was in 1854 at the London Lyceum in *Prince Pretty Pet*. His success as a comedian was rapid and he played many well-known parts. Among these was Tony Lumpkin, which he played 777 times. He also played in Shakespearean comedy, and was especially successful as Touchstone. He performed in the United Kingdom, South Africa and the United States. In April, 1909, he appeared in the *School for Scandal*. Brough was one of the most popular comedians of his generation on the English stage.

BROWER, DANIEL ROBERTS. An American neurologist, died March 1, 1909. He was born in Philadelphia in 1839 and graduated from the Polytechnic College of that city in 1860,

and from the medical department of the University of Georgetown in 1864. In the same year he was appointed assistant surgeon of United States Volunteers. From 1868 to 1875 he was medical superintendent of the Eastern Lunatic Asylum of Virginia at Williamsburg. He became later professor of nervous and mental diseases in the Rush Medical College of Chicago. He was also professor of nervous diseases in the Post Graduate School, Chicago. He was for several years editor of the *Medical Journal* and was the author of numerous monographs and a number of text-books on insanity.

BROWNSVILLE INCIDENT. See UNITED STATES.

BROWN-TAILED MOTH. See ENTOMOLOGY.

BROWN UNIVERSITY. An institution of higher learning at Providence, R. I., founded in 1764. The attendance in 1909 was 972, divided as follows: Undergraduate men, 685; undergraduate women, 185; graduate students, 102. There were 105 members of the faculty. In the University Library there were 165,000 volumes, and in the John Carter Brown Library, 20,000. There were received during the year in gifts and endowments, two scholarships; a library of English literature in memory of Hammond Lamont; \$25,000 additional endowment for Rockefeller Hall from John D. Rockefeller, Jr.; \$10,000 from Ratcliffe Hicks for a prize fund; and the Women's College was made a residuary legatee of the estate of Mrs. H. G. Miller. Gifts of land were also made to the Women's College. Among the changes in the faculty were the death of Prof. B. F. Clarke, the resignation of Prof. A. S. Morse of the Romance Department, and the appointment of A. W. Locke to the Music Department and A. B. Morton to the Department of Mathematics. The total productive funds of the University amount to about \$3,500,000 and the annual income to about \$213,000. The president is Dr. W. H. P. Faunce.

BRYAN, ELMER BURRITT. An American educator, inaugurated October 20, 1909, president of Colgate University. He was born in Van Wert, Ohio, in 1865, graduated from the Indiana State Normal School in 1889 and from Indiana University in 1893. He carried on post-graduate studies at Harvard and Clark Universities. In 1893-4 he was principal of the Kokomo High School. From 1894-96 he was teacher in the Manual Training School, Indianapolis. He was appointed to the chair of social and educational science in Butler College in 1896, and from 1897 to 1901 was assistant professor, and full professor of pedagogy in Indiana University. In 1901-2 he was principal of the Insular Normal School of the Philippine Islands, and in 1903 he acted as General Superintendent of Education in the Philippines. From 1903 to 1905 he was professor of educational and social psychology at Indiana University. From 1905 to 1908 he was president of Franklin College.

BRYN MAWR COLLEGE. An institution for the higher education of women at Bryn Mawr, Pa., founded in 1885. The number of students in 1908-9 was 420, and the faculty numbered 58. There were in the library 58,548 volumes. During the year the alumni association of the college gave \$100,000 for its endowment, the interest of the capital to be spent

in increasing the salaries of the full professors. On January 26, 1909, the General Education Board promised to give to the college \$250,000 toward its academic endowment provided that by June 2, 1910, a supplemental sum of \$280,000 be contributed to the college. The sum of \$34,000 was subscribed for rebuilding and enlarging the gymnasium. The work was completed in February, 1909. Two additional European fellowships of \$500 each were given in the year 1909, to be held in the year 1909-10, and two traveling scholarships of the value of \$150 each were given to graduates and held in the summer of 1909. The productive funds of the college amounted to about \$1,200,000 and the income to about \$85,000. The president is Miss M. Carey Thomas, Ph. D., LL. D.

BUCHANAN, WILLIAM INSCO. An American diplomat, died October 16, 1909. He was born near Covington, O., in 1853, and received his education in country schools. He was said to have worked in his early youth as a blacksmith. In 1874-5 he was engrossing clerk of the Indiana House of Representatives. He removed, in 1882, to Sioux City, Iowa, where he went into business as a dealer in crockery. He managed the Corn Palace Exposition in that city, as well as four similar enterprises, with much success, and in 1893 he was appointed commissioner to the Chicago World's Fair. Here he took charge of the Department of Agriculture and Forestry. In 1894 he was appointed by President Cleveland Minister to the Argentine Republic. His success in this office was so great that President McKinley asked him to remain and he served in that capacity until 1900. He knew little of diplomacy before assuming this office, but used his business knowledge with such skill and sagacity that the advantage of closer trade relations between North and South America became known all over the southern continent. The most notable accomplishment during his service as Minister was his decision as arbitrator between the Argentine Republic and Chile over the boundary question. As a result the two republics negotiated a treaty which provided for reducing their military establishments. Mr. Buchanan also negotiated an important reciprocity treaty between the United States and Argentina. Following his retirement as minister in 1900, he took service with the New York Life Insurance Co. and the Westinghouse interests, and adjusted matters in which they were concerned in South America. In 1901 he became Director-General of the Pan-American Exposition at Buffalo. When the new Panama government was recognized by the government of the United States in 1906 Mr. Buchanan was chosen by President Roosevelt as the man most able to handle the delicate questions involving the construction of the Panama Canal and the relations between Colombia and Panama. His service won the praise of the administration at Washington. In 1902 he was appointed a delegate by the United States to the Pan-American Conference held in the City of Mexico, and in 1906 he was sent to the second Conference held at Rio Janeiro as chairman of the American delegation. Largely through his efforts the Permanent Court of Arbitration for the settlement of disputes between the Central American countries was established. In the conference between representatives of the Central American Republics at which the treaty for the es-

tablishment of the peace court was negotiated, Mr. Buchanan appeared as adviser on behalf of the United States. After the deposition of Castro as President of Venezuela and the accession of President Gomez in 1908, Mr. Buchanan was appointed to adjust the differences which had arisen between the government of Venezuela and the United States over claims made against Venezuela by American citizens. Through his efforts several of these claims were adjusted amicably and the remaining claim was referred to the permanent tribunal of arbitration at The Hague. (See UNITED STATES, paragraph *Foreign Relations*, and VENEZUELA.) Mr. Buchanan was appointed agent of the United States in this arbitration and at the time of his death was engaged in preparing the case.

BUCK, DUDLEY. An American musician and composer, died October 6, 1909. He was born at Hartford, Conn., in 1839. In his early boyhood he showed a strong taste for music, and although his father, who was a shipping merchant, had planned a similar career for his son, the latter's taste for music was so evident, that he was permitted to make a choice of the profession of music. He took lessons from local teachers and at the same time entered Trinity College. Soon afterwards he became organist of St. John's Episcopal Church in Hartford. In his junior year at Trinity he abandoned his studies and went to Leipzig, where he entered the Leipzig Conservatory of Music. There he met as fellow students Sir Arthur Sullivan, Carl Rosa, John Francis Barnett and others who afterwards became eminent musicians. His teachers included Moritz Hauptmann in harmony, Julius Rietz in orchestration, and Moscheles and Plaidy in piano instruction. He later went to Dresden to study the organ under the noted organist, Johann Gottlob Schneider. After three years of music study in Germany he spent a year in Paris. In 1862 he returned to the United States, and after the death of his parents removed to Chicago, where he was occupied as organist, composer and teacher. The Chicago fire destroyed his effects, including manuscripts of several unfinished compositions. Following this, Mr. Buck removed to Boston, where he became organist of St. Paul's Church. He later became organist of the Boston Music Hall, which was at that time the highest honor to which a Boston musician could attain. He attracted the attention of Theodore Thomas, who was at the time conducting concerts at the Central Park Garden, New York City, and the latter in 1875 invited Mr. Buck to become his assistant conductor. This offer was accepted. His fame as an organist and writer of music grew steadily until it became international. He was invited to compose the cantata for the opening of the Centennial Exposition in 1876. In 1878 he was invited to take permanent charge of the new music hall in Cincinnati, but he had previously accepted a call from Holy Trinity Church in Brooklyn to become its organist and musical director. He remained in this position for twenty-two years, resigning in 1902 because of limitations set upon his selection of music. The same year he became organist of Plymouth Church, Brooklyn, but subsequently resigned. He was for twenty-five years director and organist of the Apollo Club of Brooklyn. Mr. Buck's important compositions

were of various kinds; the greater number are vocal, sacred and secular. In 1874 he composed *The Legend of Don Munio*, a dramatic cantata, the text of which has a metrical phrasing of his own from Washington Irving's *Alhambra*. He also wrote an introduction to the symphony *Marmion*, which was produced by the Philharmonic Society of Brooklyn under the leadership of Theodore Thomas. His *Creole Lover's Song*, with verses by Edmund Clarence Stedman, became very popular. His largest work, *Light of Asia*, was published and first performed in London in 1896. He wrote also the score of a comic opera. His literary works include *A Dictionary of Musical Terms* and *Influence of the Organ in History*. Mr. Buck was, without question, the most widely known of American organists.

BUCK, LEFFERT LEFFERTS. An American engineer and bridge builder, died July 17, 1909. He was born in Canton, N. Y., in 1837. After attendance at the public schools and some experience in practical mechanics he took a special course in mathematics at St. Lawrence University. He left these studies to enlist in the Federal army, and served throughout the Civil War. For gallantry in action he was made captain, and breveted major. Following the war he graduated from the Rensselaer Polytechnic Institute in 1868. He took charge of the first railway survey through the Adirondacks, and shortly after became an assistant surveyor for New York City. The building of bridges was his chief ambition, and in 1871 the opportunity came to him to plan and build the Virugas viaduct on the Lima and Aroya Railroad in Peru. This he later replaced by a cantilever bridge. He built, also, a suspension bridge in Northern Peru. In 1873 he entered the mechanical department of the Illinois Central Railroad. One of his most remarkable engineering feats was the complete rebuilding of the International Suspension Bridge at Niagara Falls. In 1881-2 he was resident engineer of the Central Railroad of New Jersey, and built the Lake Hopatcong Railroad for that company. He also built a number of bridges for the Northern Pacific Railroad, and two bridges over the Genesee River, at Rochester, N. Y. In 1895 he became chief engineer of the Bridge Department of New York City. He designed the Williamsburg bridge, but friction with the city officials prompted him to withdraw, and he remained consulting engineer only until the second great span was completed. He was in charge also of the plans for the Manhattan Bridge across the East River. Mr. Buck was a member of the Intercontinental Railway Commission, representing Peru and Ecuador.

BUCKWHEAT. Buckwheat remains one of the comparatively unimportant crops of the country. If the value of the crops were generally as well understood as in New York and Pennsylvania it is probable that it would be more extensively grown, for its culture may be successfully practiced in many States. Buckwheat has the advantage of a short growing season and can often be readily grown as a catch crop. It has the disadvantage, however, of being difficult to harvest, as it cannot be bound into tight sheaves like the other grains, but must be handled loose to keep the stems from moulding and rotting. The total acreage

in 1909 was 834,000 and the production 17,438,000 bushels, worth a little over \$12,000,000. As compared with the previous year there was an increase of 31,000 acres in the area devoted to the crop and of 1,564,000 bushels in the production. The leading buckwheat States are New York and Pennsylvania, which produced this year 7,512,000 and 5,855,000 bushels respectively, or almost three times as much as all the other States put together. The buckwheat area of New York was 313,000 acres and of Pennsylvania 290,000 acres. Ranking next to these States are Michigan, producing 829,000 bushels on 58,000 acres, Maine 644,000 bushels on 23,000 acres, West Virginia 499,000 bushels on 22,000 acres, and Virginia 378,000 bushels on 21,000 acres. The average yield per acre in 1909 for the entire country was 20.9 bushels. There is apparently no great domestic demand for buckwheat and most of the business done in the New York market is for export. In 1908 166,127 bushels were shipped abroad. The Canadian crop this year was quite satisfactory.

BUFFALO DRAINAGE CANAL. See CANALS.

BUILDING. See ARCHITECTURE.

BULGARIA. A constitutional monarchy (since October 5, 1908) of the Balkan peninsula. Capital, Sofia.

AREA AND POPULATION. Area (including Eastern Rumelia, 12,585 square miles; population 998,431), 37,199 square miles. Population (1905) 4,035,575, divided according to nationalities as follows: Bulgarians, 3,210,502; Turks, 514,658; Rumanians, 88,109; Greeks, 69,820; Gypsies, 67,396; Spanish Jews, 36,446; Germans, 5039; Russians, 3299; others, 40,306. Sofia had (1905) 82,621 inhabitants; Philippopolis, 45,707; Varna, 37,417; Rustchuk, 33,632; Slivno, 25,011.

EDUCATION, ETC. Primary education is free and nominally compulsory, with fees in higher grades only, these fees being confined to the rich. The State supplies two-thirds, local taxation one-third of the cost of primary instruction; one-half of the cost of secondary instruction is borne by the State. Foreign schools are numerous, special and technical schools few. There were (1906-7) 4581 elementary schools, with 8771 teachers and 400,308 pupils; 390 secondary schools, with 1990 teachers and 44,190 pupils. The non-Bulgarian schools were Turkish, Greek, Jewish, Armenian, American, French and German. The University of Sofia had (1904-5) 943 students, of whom 112 were women.

The Greek Orthodox is the established church. Other religions are recognized, and the clergy of both Orthodox and other religious bodies receive grants from the State. In 1905 there were 3,346,787 Greek Orthodox, 603,113 Mohammedans, 37,653 Jews, 29,442 Roman Catholics, 12,694 Gregorian Armenians, and 5402 Protestants.

INDUSTRIES. Agriculture is the chief occupation of the people (about five-sevenths of the population), and wheat is the principal crop produced. Of the total area, 3,585,544 hectares are under cultivation: Cereals, 2,158,338; vines, 89,818; tobacco, 3000, and 3,041,324 under forest. Cotton, rice, silk, and attar of roses are important productions. In 1905 there were 2,167,275 cattle, 8,081,816 sheep, 536,616

horses, 124,216 asses, 11,828 mules, 1,370,201 goats, and 463,241 swine.

The government coal mines at Pernik yielded 161,000 tons in 1906. The state is the owner of all minerals. Iron in large quantities, gold, silver, lead, manganese, and copper are found. About 1,000,000 cubic metres of stone are quarried annually. Woolen goods, cottons, cord, and cigarettes are manufactured.

COMMERCE. The total imports in 1908 were valued at 130,150,000 leva (1 lev = 19.3 cents), against 124,661,000 leva in 1907; exports 112,357,000 leva, against 125,595,000 in 1907. The principal articles of commerce in 1908 were as follows:

Exports	Leva
Cereals	75,975,000
Animal food products	10,683,000
Live-stock	6,437,000
Textiles	6,461,000
Perfumes	4,265,000
Skins, etc.	3,767,000
Timber, etc.	556,000
Drugs, chemicals, etc.	227,000
Imports	Leva
Textiles	39,969,000
Metals and metal articles	16,531,000
Machinery and implements	11,162,000
Colonial products	6,785,000
Skins, etc.	5,888,000
Timber, etc.	5,671,000
Drugs, chemicals, etc.	4,400,000
Stone and glass	4,308,000

The principal countries of origin and destination were (1908) as follows: Austria-Hungary, imports and exports, 35,540,000 and 6,346,000 leva respectively; Great Britain, 23,202,000 and 9,680,000; Germany, 20,847,000 and 11,626,000; Turkey, 19,153,000 and 33,482,000; France, 7,023,000 and 6,210,000; Russia, 5,635,000 and 247,000.

COMMUNICATIONS. Railways in operation in 1909 had a total length of 1053 miles, belonging to the state; under construction, 280 miles. The length of state telegraph lines (1908) was 3688 miles; offices, 295; messages transmitted, 1,700,203. There were 2053 post-offices in 1908. In 1908 15,070 vessels of 3,391,425 tons entered, and 15,039 of 3,379,179 tons cleared.

FINANCE. The unit of value is the lev, worth 19.3 cents. The revenue and expenditure in 1907 amounted to 149,515,231 and 115,658,812 leva respectively. The budget for 1908 balanced at 127,235,700 leva. The revenue and expenditure for 1909 were estimated at 153,169,450 and 153,097,088 leva respectively. The sources of estimated revenue were given as follows: Customs and excise, 52,195,000 leva; direct taxes, 43,910,000; transportation dues, 19,250,000; public domains and various internal revenues, 10,713,000; state franchises, 8,485,000; taxes, 7,825,000; fines, 940,000; additional, 6,225,000. Expenditure: war, 38,510,343; public debt, 32,989,731; public works, 23,305,008; instruction, 18,273,482; interior, 9,142,374; commerce and agriculture, 8,516,617; finance, 8,284,478; foreign affairs, 5,865,847; justice, 5,166,218; higher administration, 1,462,090; civil list, 1,250,000; court of accounts, 330,900. The net debt outstanding January 1, 1909, was 402,075,184 leva. The National Bank of Bulgaria has headquarters at Sofia, with branches at Philippopolis, Rustchuk, Var-

na, Buezas, and Tirnovo. Its capital is 10,000,000 leva; reserve fund, 3,333,333. It issues both gold and silver notes, which circulate at par. A German, a French, and an Austro-Hungarian bank have headquarters at Sofia. There are 120 agricultural banks, with a collective capital of 35,982,928 leva.

NAVY. The navy includes 6 first-class torpedo boats, 2 other torpedo boats, 1 transport, 2 yachts, 1 cruiser of 735 tons. The personnel consists of about 1130 officers and men.

ARMY. The Bulgarian army was one that interested military critics and in 1909 was at a high point of efficiency and readiness for actual service, being compared more than favorably with the majority of European armies. It had a thoroughly organized staff and exceptionally well trained artillery armed with Schneider-Cunet field guns and Krupp mountain guns. An excellent military school for the training of officers is maintained at Sofia. Military service is universal and compulsory between the ages of 18 and 40, two years being required with the colors in the infantry and three in the cavalry and artillery and a reserve service of 18 and 16 years for the infantry and other arms respectively. Thus there are available annually about 80,000 young men, and of these 24,000 are absorbed, while a large reserve is secured available for rapid mobilization, it being understood that an army of 380,000 men and some 425 guns could be put into the field within ten days. In 1909 the military establishment, not entirely complete, consisted of 3521 officers and 54,146 men. The army is divided into nine divisions, with headquarters at Sofia, Schumla, Bustchuk, Vratza, Dubnitza, Eskizagora, and Plevna. Each division embraces 2 brigades, each containing 4 regiments and generally 9 batteries. Six divisions have cavalry regiments, and in addition to the excellent artillery armament mentioned the troops are supplied with the Mannlicher rifle and carbine and the equipment for the transport and the technical troops is of the highest grade. The military expenditure in 1909 was £1,536,414.

GOVERNMENT. Bulgaria has been an independent monarchy since October 5, 1908, when Prince Ferdinand assumed the title of Czar of the Bulgarians. Eastern Rumelia is now an integral part of Bulgaria, under the administration at Sofia, now the only capital. The executive authority rests in the Czar, acting through a council of eight ministers. The legislative power is vested in a single chamber (the Sobranje, or National Assembly), whose members number one to every 20,000 of the population, and who are elected by universal manhood suffrage. The Czar in 1909 was Ferdinand, born February 26, 1861; married (1), April 20, 1893, to Marie Louise of Parma, and (2) February 28, 1908, to Eleonore of Reuss Kötitz. Heir apparent, Prince Boris, born January 30, 1894. The ministry in 1909 was composed as follows: President of the Council and Minister of Public Works, Al. Malinoff; Foreign Affairs, Lieutenant-General S. Paprikoff; Interior, M. Takeff; Finance, J. Sallabacheff; Public Instruction, M. Mushanoff; Justice, Dr. T. Kresteff; War, General Nicolaieff;

HISTORY. The chief event during the year was the recognition of Bulgaria's independence. For an account of Ferdinand's policy and Bulgaria's relations with Austria, Turkey and Russia see the article BALKAN QUESTION, where

also will be found an account of Bulgaria's agreement with Turkey as to the indemnity. After the conclusion of this agreement (April 19) the King received congratulations and telegrams from the crowned heads of the great Powers recognizing the independence of Bulgaria. On October 5 the latter entered Sofia for the celebration of the anniversary of Bulgaria's independence. A convention was signed between the Bulgarian government and the Oriental Railways Company on January 28. (See TURKEY, paragraphs on *History*.) The first session of the Sobranje closed on February 13. One of its legislative measures was the passage of a tax on bachelors over thirty years of age, from which it was estimated that the proceeds would be 250,000 leva. The budget voted called for an outlay of about \$31,000,000, the largest ever adopted by Parliament. On October 24 King Ferdinand started on a visit to Servia, which was welcomed as a sign that cordial relations between the two countries would be restored. On the opening of the second session of the Sobranje, the King referred with gratitude to the sympathy of Russia and to the efforts of the Powers in 1908 toward securing the recognition of Bulgarian independence. On December 1 Bulgaria and Turkey signed an agreement for the change of their respective commercial agencies into consulates subject to international law.

BULL, WILLIAM TILLINGHAST, M. D. An American surgeon, died February 22, 1909. He was born at Newport, R. I., in 1849 and graduated from Harvard University in 1869. He studied at the New York College of Physicians and Surgeons and in Europe. In 1875 he began the practice of medicine in New York City. He was demonstrator and consulting surgeon in several hospitals in that city, and from 1889 was professor of the practice of surgery in the College of Physicians and Surgeons. Dr. Bull was one of the most eminent surgeons in the United States. He was one of the pioneers in operating for appendicitis, and was an especial authority on cancer. It was by this disease that he came to his death.

BÜLOW. **BERNHARD, PRINCE VON.** A German statesman, born 1849, and from 1900 to July 14, 1909, Chancellor of the German Empire. He was born at Klein-Flottbeck, Holstein. After studying in the Universities of Leipzig and Berlin and serving in the Franco-Prussian War, he entered the German Foreign Office in 1874. He served as secretary of legation at Rome, St. Petersburg and Vienna, and was Chargé d'Affaires at Athens during the Russo-Turkish war of 1877-8. After further diplomatic service in St. Petersburg and Paris he was appointed Minister to Rumania in 1888, and became ambassador to Italy in 1893. In 1897 he was made Foreign Secretary, and in 1899 made the treaty with Spain which gained for Germany the Caroline, Pelew and Ladrone Islands. For this service he was made a count. In 1900 he succeeded Prince Hohenlohe-Schillingfurst as Chancellor of the empire and Prime Minister of Prussia in 1900. Von Bülow was considered the strongest Chancellor since Bismarck. His chief endeavors were toward the strengthening of German influence. In 1905 he began a campaign against the ambitions of France in Morocco, which resulted in the fall of the French Foreign Minister, Delcassé, and the meeting of the Algeciras Conference in 1906.

He was given the rank of Prince in 1905. Although von Bülow was in almost uniform sympathy with the designs and policies of Wilhelm II. he did not hesitate to deliver to his imperial master a studied rebuke, when he declared, before the Reichstag, in 1908, that if the former were not more careful in his public utterances he (von Bülow) could not continue to hold his office. Relations between the Emperor and his Chancellor were reported to be strained, despite the outward signs of harmony. Von Bülow was in favor of a large German army, but constantly declared that it was not for aggression but for defense. For the circumstances of his resignation see the article GERMANY, paragraphs *History*.

BURKE, JOHN MASTERSON. An American merchant and philanthropist, died December 2, 1909. He was born in New York City in 1812. At the age of 16 years he went to work for a shipping and trading firm. Early in his twenties he was able to start in business for himself. One of his first ventures was the chartering of a ship loaded with various merchandise for South America. He was successful in business and by the time he was 50 years old he had established himself as one of the leading traders in the country. He retired from business in 1870 and thereafter devoted himself to the investment of his property. In 1902 he conveyed to a corporation composed of five well-known men in New York, \$4,000,000, to be spent in caring for worthy poor and in providing maintenance for poor persons during convalescence. This corporation he named the Winifred Masterson Burke Relief Association in memory of his mother. By the death of Mr. Burke the entire sum of \$4,000,000 became available for a Convalescents' Home.

BURMA. A province of British India lying to the north and east of the Bay of Bengal. (See INDIA, BRITISH.) In 1906 the Rangoon government had complained to the home authorities against rigorous treatment, especially in the matter of the expropriation of the rents of reclaimed land. The acts of which complaint were made were the expression of the policy consistently pursued toward Rangoon since 1894. In September it was announced that Lord Morley had reversed this policy on consideration of Rangoon's complaints and had decided to appropriate to the city the sum of £20,000 annually for public works and more if the rents were remitted, and to cancel the orders requiring Rangoon to pay the full market value for land needed for public purposes; also to pay a part of the taxes for the reclaimed areas.

BURNE, SIR OWEN TUDOR. An English major-general, died June 27, 1909. He was born at Plymouth in 1837. He was educated at Sandhurst, and was gazetted to the Twentieth Regiment. The Crimean War ended just too soon for him to see service, but in 1857 he reached India during the progress of the great mutiny. He was in fifteen actions, including

the final siege and capture of Lucknow. For gallant service he was recommended for the Victoria Cross. In 1860 he became military secretary to Sir Hugh Rose, the commander-in-chief. He resigned this post within a year and became private secretary to the Earl of Mayo, with whom he went to Ireland. Returning to India in 1868 as private secretary to Lord Mayo, he was a witness to the murder of the latter by a Pathan convict in 1872. From 1874 to 1887 he was secretary to the Political and Secret Department, India Office. In 1887 he became a member of the Council of India, serving until 1897.

BURT, GEORGE ALBERT. An American railway and public official, died March 11, 1909. He was born in Fall River, Mass., in 1846. During the Civil War he served as ensign of the United States frigate, *Massasoit*. Following the war he became Vice-Consul in Guatemala, and later, general manager of the Panama Railway. During the insurrection in Panama in 1895, Burt telegraphed to President Cleveland as follows: "Unless you guarantee sufficient protection I shall withdraw every American citizen and proceed to the United States in a chartered vessel." Warships were at once sent to the Isthmus, where Burt had organized the employees of the railroad in defense of property and the women and children of the American and foreign residents. For this he received the official recognition of the British, French, Spanish and other governments. Subsequently he became general manager of the Brazilian Mail Steamship Co., and during the Brazilian revolution he fitted up an expedition from New York to Brazil. He, with Morris B. Flinn and C. F. Sprague, built the first electric railroad in the United States, at Richmond, Va.

BURTON, FREDERICK RUSSELL. An American composer and writer, died September 30, 1909. He was born at Jonesville, Mich., in 1861, and graduated from Harvard in 1882 with the highest honors in music. He engaged in newspaper work and in the writing of music. He took great interest in the subject of Indian music and having made a careful study of this he became enthusiastic as to its possibilities. In order to secure money to continue his research he at one time took a company of Indians around the United States and to Europe, but the scheme failed and he was obliged to ship the Indians home and take up newspaper work in London to pay his own way home. At the same time, however, he worked on a book of Indian music, which was completed under the title *American Indian Songs*. He wrote also a novel on Indian life entitled *Red Cloud*. His most important work was the Indian cantata, *Hiauatha*, which was produced in 1898. This was successful and at once made him a well-known figure in the musical world both at home and abroad. In addition to his Indian music he was the author of several novels and a number of essays and short stories. He composed also the cantata, *Legend of Sleepy Hollow*, and various songs and choruses. He was for many years on the staff of the New York Sun. A posthumous work, *American Primitive Music*, was published in 1909.

BURTON, MICHAEL ARTHUR (BASS), BARON. An English brewer and philanthropist, died on January 25. He was born in 1837, and

was educated at Harrow and Trinity College, Cambridge. He became head of the great brewing firm of Bass, Ratcliff and Gretton, of which his grandfather was the founder. Lord Burton gave large sums of money for philanthropic and other purposes.

BURTON, THEODORE ELIJAH. An American public official, United States Senator from Ohio. He was born in Jefferson county, Ohio, in 1851, and graduated from Oberlin College in 1872. He was admitted to the bar in 1875 and from that time practiced law in Cleveland. From 1889-91 and from 1895 to 1909 he was a Member of Congress. He was appointed by President Roosevelt chairman of the Inland Waterways Commission in 1907, and in the same year was the Republican nominee for Mayor of Cleveland against Tom L. Johnson. Although he had the strong support of President Roosevelt, he was defeated. He was elected United States Senator to succeed Joseph B. Foraker on January 13. Senator Burton during his service in Congress was considered to be one of the most efficient and capable members of that body.

BUSH, THOMAS GREENE. An American ironmaster and philanthropist, died November 11, 1909. He was born in Alabama in 1847 and served in the Confederate army. During the service he was taken a prisoner by the Union forces. He was a member of the Monetary Commission created at the Indianapolis Conference in 1897 and was also a trustee of the Nobel Foundation Fund for the Promotion of Industrial Peace, appointed by President Roosevelt. He was president of the Shelby Iron Co. and many other important industrial companies in the South.

BUTLER, ARTHUR GRAY. An English clergyman and educator, died January 16, 1909. He was born at Northants, August 19, 1831. He was educated at Rugby and University College, Oxford. After service as assistant master he was head master of Haileybury College from 1862 to 1867. From 1875 to 1895 he was a tutor at Oriel College, Oxford. He was a select Preacher at Oxford, and took an active interest in economic and social questions. He wrote *Charles I.; a Drama* (1874); *Harold; a Drama*; *Choice of Achilles and Other Poems* (1900); *Hodge and His Land* (1907).

BUTLER, JOHN GEORGE. An American Lutheran clergyman, died August 2, 1909. He was born in Cumberland, Md., in 1826 and was educated at Allegheny Academy, Pennsylvania College and the Theological Seminary at Gettysburg, Pa. From 1849 to 1873 he was pastor of St. Luke's English Lutheran Church in Washington, and from 1873 to the time of his death was pastor of the Luther Place Memorial Church. He was one of the first hospital chaplains appointed by President Lincoln and he served throughout the Civil War in and about Washington. He was chaplain of the United States House of Representatives from 1869 to 1875 and was also for several years chaplain of the United States Senate. He was for nearly thirty years professor of homiletics and church history at Howard University. He was editor of the *Lutheran Evangelist*.

BUTLER, MATTHEW CALBRAITH. An American lawyer, former Senator from South Carolina, died April 14, 1909. He was born near Greenville, S. C., in 1836, and attended the

South Carolina College from 1853 to 1856. In the latter year he was admitted to the bar. He was elected to the State Legislature in 1859. He served in the Confederate army during the Civil War, rising from the rank of captain to that of major-general. In the battle of Brandy Station, in 1863, he lost his right leg. He was elected to the State Legislature in 1866, and from 1877 to 1889 he was United States Senator. He served in the Spanish-American War as major-general of volunteers, and at its close was appointed a member of the commission to assist the Spanish government in evacuating Cuba. He declined the offer of President McKinley to retire as an army officer.

BUTTER. See DAIRYING.

CABELL, BENJAMIN FRANCIS. An American educator, died September 20, 1909. He was born in Campbellsville, Ky., in 1850, and was educated in the public schools of Bedford, Indiana, and Wesleyan University, Delaware, Ohio. In 1875 he was professor in Warren College (now Ogden College), Bowling Green, Ky. In 1877 he was elected president of Cedar Bluff College, Ky., and in 1889 was chosen president of Potter College, which position he held at the time of his death.

CALHOUN, WILLIAM JAMES. An American lawyer and diplomat, appointed in December, 1909, Minister to China. He was born in Pittsburg, Pa., in 1848 and received an academic education in Poland, Ohio. He was admitted to the bar in 1875 and practiced law at Danville, Ill. From 1898 to 1900 he was a member of the Interstate Commerce Commission. He engaged actively in politics and in 1896 took a prominent part in the campaign in behalf of President McKinley. Largely through his efforts Illinois cast its vote for President McKinley in the National Convention. In 1905 he was selected as a special commissioner to Venezuela to investigate the conditions in that country. His report has formed the basis for American action ever since in maintaining the principle of the Monroe Doctrine.

CALIFORNIA. One of the Pacific Coast States of the United States. Its total area is 158,297 square miles, of which 2205 square miles are water. In 1900 the population was 1,485,000. According to an estimate made in 1909 by the Federal government the population was 1,729,543. The capital is Sacramento.

MINERAL PRODUCTION. California is one of the most important States in its production of minerals. As a producer of gold it has been notable since the discovery of gold in 1848. Although the yearly production has fallen off from the great totals of the first fifteen or twenty years, it shows a remarkable even rate in the value of the gold produced. The amount produced in 1908 was the largest in point of value of the last ten years, excepting that of 1905, which heretofore was the banner year of that period. The production in 1908 was 935,074 fine ounces, valued at \$19,329,700, a substantial increase over the product of 1907, which was 815,288 fine ounces, valued at \$16,853,500. In the production of gold California is outranked only by Colorado. The silver produced in 1908 was a considerable increase over the amount produced in 1907. The price of silver, however, resulted in the product of 1908

being considerably less in value than that of 1907. The comparative figures were as follows: 1908, 1,703,700 fine ounces, valued at \$911,300; 1907, 1,590,000 fine ounces, valued at \$1,049,400. The production of copper has shown a marked increase in the past few years, and the product of 1908 showed a considerable increase over that of 1907, although as in the case of silver, the lower price of the metal decreased the value of the product from that of the previous year. The comparative figures are as follows: 1908, 39,643,835 pounds, valued at \$5,232,986; 1907, 33,696,602 pounds, valued at \$6,739,320. Almost the entire quicksilver product of the country comes from California. In 1908 there were produced 16,984 flasks, valued at \$684,716, as compared with 17,431 flasks, valued at \$662,544 in 1907. The decrease in the hydraulic mining of gold and the decreased amount of gold and silver required by amalgamation process, together with the increased tendency to ship ores of the precious metals to smelters, have decreased the local demand for quicksilver. California ranked second in quantity and first in value among the States producing petroleum in 1908. The value of the oil production in 1908 exceeded that of any other mineral product. The total production was 44,854,737 barrels, valued at \$23,433,502, as compared with 39,748,375 barrels, valued at \$14,899,976, in 1907. With one exception every district in the State increased in production during the year. This condition was brought about by the increasing demand and consequent high prices of oil, which stimulated drilling. The completion of the pipe line in 1907 and the completion of the railroad to Midway, together with the construction of the new pipe line of the Associated Oil Company from Kern River to tidewater in 1908, did much to encourage drilling and increase production. More crude oil was shipped from the fields of Southern California in 1908 than ever before. The greater part of the oil exported from California comes from the Santa Maria field, its situation giving it command of the coast trade from Alaska to Chile and of the foreign trade with Japan and Hawaii. No new oil fields of importance were discovered in 1908, though petroleum was discovered in several places, one being in Mono county near Mono Lake. The production of mineral waters was an important industry in the State in 1908. 1,960,770 gallons, valued at \$499,872, were sold, as compared with 1,680,169 gallons, valued at \$460,972, in 1907. The stone products of the State in 1908 were valued at \$3,291,585, as compared with \$3,134,429 in 1907. California is one of the most important of the States producing salt. The production in 1908 was 899,028 barrels, valued at \$374,828, as compared with 626,693, valued at \$302,940, in 1907. A great portion of the asphalt produced in the United States is derived from California. The product in 1908 was 135,241 short tons, valued at \$1,347,257, as compared with 131,068 short tons, valued at \$1,213,957, in 1907. Other important products were borax, clay products, natural gas, and lead. Precious stones are mined more extensively in California than in any other State. The total value of the mineral products of the State in 1908 was \$65,137,636, a considerable increase over the value of the product of 1907, which was \$56,679,436.

The gold production of 1909 was estimated

by the Director of the Mint at 1,029,000 fine ounces, valued at \$21,371,300. This was a gain of \$1,941,600 over the production of 1908. The silver production in 1909 was 1,705,200 fine ounces, valued at \$887,000.

The copper output of 1909 showed a considerable increase over that of 1908.

California ranked first in the oil production of 1909, producing fully ten million barrels more than Oklahoma, which ranked second. The developments begun in 1908 continued with increasing rapidity in 1909, and many sections produced wells of large capacity. One of the most important events of the year was the drilling of the Silver Tip well, on section 6, Coalinga field. This is said to be, with the possible exception of the Hartnell well of the Union Oil Co., drilled at Santa Maria in 1904, the greatest well ever drilled in the State. Other important developments extended the Coalinga field to the west and south during the year. During 1909 several pipe lines were under construction to carry the increased product, and although no exact statement could be made at the end of the year, there was undoubtedly a very substantial gain over the output of 1908, and a satisfactory increase in price.

According to the figures given by the *Engineering and Mining Journal*, California produced in 1909 58,250,300 barrels of crude petroleum. This represents an increased output of 13,250,300 barrels. The Coalinga field was the largest producer in the State. During December a record production of 5,300,000 barrels was made, the number of producing wells being about 4000.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 1,740,000 bushels, valued at \$1,583,000, from 50,000 acres; winter wheat, 11,550,000 bushels, valued at \$12,820,000, from 825,000 acres; oats, 6,280,000 bushels, valued at \$4,145,000, from 200,000 acres; barley, 31,270,000 bushels, valued at \$23,140,000, from 1,180,000 acres; rye, 842,000 bushels, valued at \$876,000, from 61,000 acres; potatoes, 7,800,000 bushels, valued at \$6,006,000, from 60,000 acres; hay, 1,105,000 tons, valued at \$12,708,000, from 650,000 acres. The production of corn increased slightly over the product of 1908, which was 1,600,000 bushels. There was a considerable increase in the production of barley over 1908. In the latter year, 25,427,000 bushels were produced. The State ranks second in the production of this commodity, being surpassed only by Minnesota. The rye crop showed an increase in 1909 over the product of 1908. In the latter year 792,000 bushels were produced. The potato crop showed an increase of over 2,000,000 bushels over 1908. In the latter year there were produced 5,243,000 bushels. The hay crop also was considerably larger in 1909 than in the previous year, when it was 817,000 tons. The production of citrus fruits has steadily increased in the last few years. This State ranks second in the production of beet sugar. The number of farm animals on January 1, 1910, was as follows: Horses, 420,000; mules, 83,000; milch cows, 452,000; other cattle, 1,120,000; sheep, 2,372,000; swine, 540,000. In recent years there has been a decrease in the number of sheep. The wool clipped in 1909 was 10,269,280 pounds.

EDUCATION. The total enrollment in the schools of the State for the year ending June 30, 1909, was 349,145. Of these 180,481 were boys and 170,664 were girls. The enrollment in the elementary schools was 311,089, of which 162,321 were boys and 148,768 were girls. In the high schools were 34,298 pupils, of whom 15,386 were boys and 18,912 were girls. In the kindergarten schools were enrolled 5758 pupils, 2984 being girls and 2774 boys. The total number of teachers was 10,789, of whom 1466 were men and 9303 were women. In the elementary schools there were 900 men and 8200 women teachers, and in the kindergarten 179 women teachers. In the high schools of the State were 566 men and 924 women teachers. The valuation of the school property in the State was \$38,666,761, of which \$30,718,246 was elementary schools; \$7,933,560 high schools and \$14,955 kindergartens. The total expenditures for education amounted to \$15,985,255, of which \$12,734,320 was expended for elementary schools, \$3,119,886 for high schools, and \$131,048 for kindergartens. The high schools of the State have made great gains in the last few years, since the provision for State aid to each school.

FINANCE. According to the biennial report of the State Treasurer for the years ending July 1, 1906, and July 1, 1908, there was a balance at the close of the fiscal year ending June 30, 1907, of \$7,149,904. The receipts during the fiscal year ended June 30, 1908, were \$15,514,801. The expenditures for the same period were \$15,359,650, leaving a balance on hand June 30, 1908, of \$7,305,045. The State trust funds on deposit in banks on June 30, 1908, amounted to \$3,668,150. The legislature in the session of 1907 passed an act permitting the deposit in banks of money belonging to the State. The amount of interest on deposits collected to June 30, 1908, was \$8890, and the amount of deposits at the end of the year was \$4,257,350.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under State control included the State Prison at San Quentin, the State Prison at Folsom, the Preston School of Industry, the Whittier State School, these being State reform schools, the Stockton State Hospital for Insane, the Napa State Hospital, Agnews State Hospital, the Mendocino State Hospital, the Southern California State Hospital, Home for the Care and Training of Feeble Minded Children at Eldredge, the Institution for the Deaf and Blind at Oakland, the Industrial Home for the Adult Blind at Oakland, and the various county houses and asylums. The total enrollment in the State prisons on June 30, 1908, was 2612, in the State reform schools, 977, in the State hospitals for insane, 6033. The number of inmates in all the State institutions on June 30, 1908, was 10,642. The expenditures for these institutions amounted to \$2,343,749.

POLITICS AND GOVERNMENT. The chief political interest of the year centred about the attempt to pass through the legislature certain measures antagonistic to the Japanese. These included proposals to forbid Japanese aliens to hold land, to segregate them into quarters of their own, and to forbid their becoming members of California corporations; and provisions for the segregation of Japanese children in separate schools. These measures were introduced

early in the session and at once drew the attention of President Roosevelt, who became greatly concerned over their possible passage. He sent, on January 18, a telegram and a letter to Governor Gillett, seeking to enlist his efforts in a plan to prevent the anti-Japanese legislation. The President took the stand that under the agreement entered into between the American and Japanese governments in 1908, 2000 more Japanese had left the United States than had come into it. He expressed himself as emphatically opposed to discriminatory legislation. On receipt of the President's telegram, Governor Gillett at once took measures to hold up the bills and notified President Roosevelt to that effect. Governor Gillett on January 26 sent a special message to the legislature urging the members of that body to take no further action on the anti-Japanese bills, because such legislation would seriously embarrass the United States government in its dealings with Japan. He suggested that before any action be taken on the bills, the legislature instruct the Labor Commissioner to make an accurate census of the Japanese in California. If it was found that coolie labor from Japan continued to pour into the State, he said, then it would be soon enough to take such action as is proper, and by legislation remedy the conditions. The Governor called the attention of the legislature to the fact that no law which the State could enact would prevent Japanese immigration, as Congress alone is vested with power to pass such legislation. In accordance with a request of the Governor, the legislature voted on January 27 to postpone all action on the bills for another week. This was due in a measure to the fact that the Governor intimated in his message of January 26, that he would veto any of these bills if they should be passed. Governor Gillett on the same day received a telegram from President Roosevelt saying that the alien land bill was the only measure that would be approved by the administration, and asking him to use his influence in securing delay. On January 27 Senator Mark Anthony introduced a joint resolution calling upon Congress to request that the Japanese Consul in San Francisco be recalled by his government, because he had attempted to influence the action of the California Legislature in calling upon Governor Gillett and asking him to prevent the passage of Japanese bills then pending. No action was taken on this resolution.

In spite of the efforts of President Roosevelt and Governor Gillett to prevent their passage, the Assembly, on February 1, voted to make a special order for the passage of the bill on the following Wednesday. An effort was made to kill the bill, but the vote stood 33 to 17 to consider it. The bill was somewhat amended in that all reference to Japanese was eliminated and provision was made that aliens should be able to hold land on five year leases, but not to acquire any land by deed. When the bill came up for passage on February 3, in the Assembly, it was defeated by a vote of 48 to 28, in spite of the strong effort of its supporters to have it passed. This action of the legislature did not, however, put an end to the attempts to pass anti-Japanese legislation. The bill excluding Japanese children from public schools next came up for passage, and President Roosevelt sent Governor Gillett another tele-

gram inquiring if the rumor was true that the legislature had passed the bill, and declaring that this was the most offensive measure of all, and in his judgment clearly unconstitutional. The bill had passed the Assembly on February 4, although bills providing that Japanese must live within restricted districts, and prohibiting aliens from being members of corporations doing business within the State had been defeated. Governor Gillett sent to the legislature a second special message urging a reconsideration of the anti-Japanese school bill. The Speaker of the House, Philip A. Stanton, also made a strong appeal for reconsideration. As a result of these measures, unanimous consent of the Assembly to postpone further action until the following Wednesday was secured. While the matter was pending in the Assembly, State Senator Caminetti transferred the seat of disturbance to the Senate by introducing on February 6 practically the same bill that had been introduced into the House, disguised as an educational measure. He also succeeded in having it referred to the Committee on Education, of which he was an important member, instead of the Committee on Federal Relations, to which it would naturally have gone. President Roosevelt, on February 8, called a conference at the White House, at which were present Robert Bacon, Secretary of State, Senator Flint and Representative Kahn, of California, and Franklin K. Lane, of the Interstate Commerce Commission, who is also a Californian. The President made it clear that he wished to stir up as strong a public sentiment as possible, and to enlist the strongest individual influences to prevent action of the General Assembly directed toward Japanese immigrants and residents. Later in the same day he sent a telegram to the Speaker of the Assembly in which he again pointed out the importance of preventing the passage of measures which would embitter the friendly relations between the United States and Japan. He pointed out again the excellent results which had come from the policy previously adopted in relation to the Japanese, under which more had left the country than had come into it. He declared that such a bill as this school bill could accomplish nothing whatever in the object aimed at, but would give just and grave causes for irritation, while in addition the United States government would be obliged immediately to take action in the Federal Court to test such resolution. On February 10, after one of the strongest debates ever known in the State Capitol, the Assembly, by a vote of 43 to 34, voted to reconsider the bill providing for segregating Japanese pupils in public schools, and on the final vote on the passage of the bill, killed it by a vote of 41 to 37. The strong support of the bill was said to have been due mainly to President Roosevelt's interference in State affairs. After the school bill had been killed, Representative Johnson called up his motion to reconsider the vote by which the anti-alien land bill was lost. This was voted down and this finally disposed of all the anti-Japanese bills in the Assembly. The bill introduced into the Senate by Senator Caminetti was also killed. On February 4 the Senate passed a bill providing for a census of the Japanese in the State to determine whether California should act for a general Asiatic exclusion act.

Municipal conditions in Los Angeles attracted more than local attention in the early part of the year. In February several radical changes were adopted in the city charter. These gave the city power to construct and operate utilities employing electricity as it previously had power over utilities employing water and gas. A new form of legislative council was adopted by which every councilman has a share in representing the city at large and regards his constituents, not as a group, but as a great body of citizens jointly undertaking to manage their common affairs. The citizens also decided that hereafter nominations for municipal officers should be made by petition and without party designation. Mayor Harper and certain members of the police department had, in 1908, been charged with serious offenses, and on February 10 the grand jury submitted a report strongly censuring the Mayor and a part of the police commission for failure to enforce the laws against vice. No indictments, however, were returned, because the conditions criticised had been remedied since the beginning of the investigation. The Mayor in the meantime had placed at the head of the Board of Public Works, which is to have control of the expenditure of some \$30,000,000 within the next four years, the man who was then Chief of Police. A strong protest arose against his appointment and a campaign was begun for the recall of the Mayor in accordance with the provisions of the charter governing the city which provided for such action. Enough signatures were secured on the petition for the recall election. On March 9, the man whom the Mayor had placed on the Board of Public Works resigned, and two days later Mayor Harper himself withdrew, not only from the campaign, but from the mayor's office. He immediately left the city, leaving it without an executive officer. His resignation was said to have been the result of the threatened publication of facts concerning his private life, which were to be made known in case he refused to resign his office. A candidate for the mayoralty had been nominated, but he was not favored by a majority of the City Council. The Republican organization demanded the election of George A. Smith for the rest of the term for which Mr. Harper had been elected. It was urged, on the other hand, that by virtue of the recall proceedings a new election was to take place in any case on March 26, and therefore the Council only had the right to fill the interim. At the advice of the City Attorney, the Council followed the latter course, and William B. Stevens filled the office for a term of eleven days. On March 26 George Alexander was elected Mayor to succeed Mayor Harper. This was the most important and interesting test to which the recall system has been put in any State.

The legislature on March 27 passed the Wright-Stanton direct nominations bill in accordance with which hereafter nominations of party candidates will be made by petitions of the party voters. This bill puts into effect an amendment of the State Constitution, which was adopted by a large popular majority in 1907. See ELECTORAL REFORM.

On January 12, George C. Perkins was re-elected to the United States Senate by the legislature. He received the votes of all the 49 Republicans in the Senate and 56 of the 60

Republican Assemblymen. The Democrats in the legislature voted for J. O. Davis, of Hollister. Measures were passed by the legislature providing for the abolition of race-track gambling, and also for the prohibition of slot machines in San Francisco after July 1, 1909.

On May 3, in an opinion handed down by Judge Ross of the United States Circuit Court of Appeals, it was held that the \$330,000 fine against the Santa Fe Railroad Company was not valid. The case was remanded for new trial. The government brought action against the railroad company for giving rebates to the Grand Canyon Lime and Cement Company. Sixty-six cases of rebating were established by the government, and a fine of \$5000 on each count was assessed. Judge Ross held that the statute expressly forbids departure from the legal rate when wilfully made, hence the question of intent entered into the charge made in the indictment. That being so, it necessarily resulted that the lower court was in error in withholding from the jury evidence that more or less lime shook out in handling.

On April 5, the city of San Diego voted for license. On January 29, the Supreme Court held that the primary law of the State was constitutional.

SAN FRANCISCO. The prosecution against city officials and others for alleged corruption continued during the year, but it was probably brought to a close, at least for the time being, as a result of the election on November 2, which voiced strong public opinion against further prosecution of these cases. The prosecutions had their beginnings in November, 1905, when Francis J. Heney, who had been employed by Rudolph Spreckels as special investigator of municipal affairs in San Francisco, charged in a public address that Mayor Schmitz, and Abraham Ruef, political leader of the city, were guilty of corruption. Under Heney's supervision, W. J. Burns, formerly a government secret service agent, undertook an investigation of the privileges awarded several public service corporations. Ruef and Schmitz were indicted on the charge of extorting money from French restaurant proprietors in 1906, after Ruef had failed in an effort to seize the District Attorney's office through his appointment by the Board of Supervisors. Mr. Heney had, in the meantime, been appointed by the District Attorney an Assistant District Attorney to prosecute these cases. The graft investigation was conducted secretly for several months following, but in the early part of March, 1907, Burns succeeded in trapping several of the supervisors in the act of accepting money from a skating rink proprietor, who was acting in the interests of the prosecution. Within a week eighteen supervisors had confessed their acceptance of money from six sources. It was subsequently announced that the supervisors had been promised immunity for their testimony against the men charged with offering bribes. A grand jury, impaneled under the direction of Mr. Heney in October, 1906, heard the confession of the supervisors on March 19, 1907, and in forty-eight hours returned more than 300 indictments against various persons charged with complicity in offering bribes. Patrick Calhoun, President of the United Railroads, was indicted, together with Abraham Ruef and three subordinate officials of the United Railroad on fourteen counts, three of which were re-

turned by a later grand jury. It was charged that the corporation had secured from the supervisors on May 21, 1906, a permit, authorizing the substitution of an overhead trolley system for the cable lines partially destroyed by the earthquake and fire of April 18, 1906. Mr. Calhoun and the other defendants were accused of having paid Ruef, Schmitz, and the supervisors, \$200,000 for their services in securing the permit from the company and each indictment was based upon the money received by one of the supervisors. Tirey L. Ford, General Counsel for the United Railways, was also implicated by the indictments and was tried three times. In the first trial a disagreement resulted, and in two subsequent trials, Ford was acquitted. Mayor Schmitz was convicted on June 13, 1907, and was sentenced to five years' imprisonment in the State Penitentiary. He was found guilty on evidence that he had shared in fees paid to Ruef by the proprietors of certain restaurants in return for which they were permitted to carry on illegitimate business. On January 9, 1908, three justices of the District Court of Appeals reversed the conviction on the ground that the compelling of the French restaurants to pay these fees by Ruef was not a crime, according to the laws of the State, even though he shared them with Schmitz. The sentence was set aside, also on other grounds. The effect of this decision was to invalidate the four remaining charges of extortion against Ruef and Schmitz, and to render void the confession made by Ruef, as the facts that he had confessed were decided not to be criminal. There still remained against Schmitz about forty indictments for bribery, and against Ruef 126 indictments charging the same crime. The State Supreme Court on March 9, 1908, refused to grant a rehearing and affirmed the decisions of the Appellate Court that the offense charged was not a felony in the legal sense. On March 21, the remaining indictments for extortion pending against Schmitz were dismissed, and he was released on bail, awaiting trial on other charges. The first trial of Ruef also failed on this technicality. He was brought to trial on another indictment on August 27, 1908. On November 13 the trial was interrupted for several days by the shooting of Francis J. Heney in the court room by an ex-convict, who afterwards committed suicide in the county jail. Three volunteer prosecutors then took up the case and on December 10, 1908, the jury returned a verdict of guilty. On December 29, Ruef was sentenced to fourteen years in the San Quentin penitentiary, and since that time he has been confined in the county jail, awaiting action on appeal.

The prosecution had attempted to prove that Patrick Calhoun on the day following the final passage of the permit for the overhead trolley, sent from New York to the Mint in San Francisco \$200,000, which he authorized the Mint officials to pay to Tirey L. Ford. The money, it was charged, was withdrawn in three installments by Ford, who presented orders signed by Calhoun. It was alleged by the prosecution that within a few days after each of Ford's visits to the Mint he received a call from Ruef. James L. Gallagher testified that Ruef had paid him \$40,000 in July and an equal amount in the following month. Gallagher stated that he had retained \$15,000 for himself and had di-

vided the remainder among the other supervisors. It was affirmed by the prosecution that Ruef and Schmitz divided the balance of the fund, about \$115,000. The specific indictment upon which Mr. Calhoun was tried was the offer of a bribe of \$4000 to Supervisor Fred P. Nicholas to influence his action upon the trolley permit. The trial began in January, 1909, but the jury was not completed until April 15. Many sensational incidents occurred during the progress of the trial. In March warrants were issued for the arrest of several men charged with stealing documents from the office of William J. Burns, special agent of the District Attorney's office. On March 26 and 27, the law offices of Patrick Calhoun were raided by the police upon a search warrant procured by Burns, who claimed to have information that his stolen papers were there. Over 200 documents were seized and delivered into the custody of the police judge, who had granted the warrant. Before the raiders had completed the task, attorneys for the United Railways had secured injunctions forbidding further search. Another order was secured forbidding the police judge to open the sealed packages. Many complications resulted during the progress of the trial through the activity of private detectives, several of whom admitted to have been privately in the employ of one side while secretly furnishing information to the other. Among the witnesses called in the trial was Rudolph Spreckels, who had instituted the graft prosecution. It was shown that \$234,000 had been raised and expended, and Mr. Spreckels's accounts, voluntarily produced in court, showed that he had contributed approximately \$175,000 of the total. The trial ended on June 20, in a disagreement of the jury. Ten voted for acquittal and two for conviction. Preparations were at once begun by Mr. Heney for a new trial. On June 28, the attorneys for Mr. Calhoun presented in court an affidavit contending that Mr. Heney was incompetent to try the graft cases because of his prejudice against Calhoun and other defendants, and also because he had violated the State law by accepting pay from Rudolph Spreckels while he was receiving money from the government in the Oregon land fraud cases. It was charged that Heney had received \$69,025 from the government, of which \$15,000 was in excess of the orders given by the Attorney-General. Mr. Heney declared that this money had been due him as the result of work previously done. In the primaries held on August 17, Mr. Heney's name was placed on the general ticket as a candidate for District Attorney. The only other candidate for the office on any ticket was Charles Fickert, the nominee of the Regular Republican, or Business Men's Committee. Fickert was regularly nominated and his name was printed on the ballot, while that of Mr. Heney had to be written in. Fickert received 11,000 Republican votes against 4300 for Heney. In the Democratic vote Heney received 2384 against 2260 for Fickert. In the elections held on November 2, Heney was defeated by about 15,000 votes. The Union Labor Party had nominated for Mayor P. H. McCarthy, while the nominee of the Democrats was Dr T. B. W. Leland, and of the Regular Republicans, William Crocker. McCarthy received 10,703 votes; Leland 7549 and Crocker 5399. The result of the election was taken to indicate that public sentiment was

no longer in favor of the graft prosecutions. It had, in fact, been steadily waning. The convictions of Ruef and Schmitz were greeted with the greatest enthusiasm, but when prosecutions were begun against prominent citizens and business men, less sympathy was shown, and gradually the opposition to the prosecution became as bitter as the feeling against Ruef and Schmitz had previously been. A temporary change was brought about as a result of the shooting of Mr. Heney, when public sentiment again rallied to him, but this also finally cooled. McCarthy has been the head and front of labor unionism in San Francisco for fourteen years. He sought office on a platform which promised a business man's administration of city affairs.

In addition to the trial of Mr. Calhoun, other trials were carried on during the year. On March 2, Michael W. Coffey, one of the supervisors who had confessed to receiving bribes, was convicted and sentenced to seven years in the San Quentin penitentiary. Coffey had been promised immunity in return for his testimony against Ruef and others. When the Appellate Court reversed the conviction of Schmitz he refused to keep his bargain, and was indicted for accepting a bribe of \$4000 from the United Railways. On April 16, A. S. Newburgh, an attorney who was accused of attempting to bribe a juror in the Ruef case, was acquitted.

On October 19-23, the city held a festival in honor of Don Gasper de Portola, who discovered San Francisco Bay in 1769, and was also the first Spanish Governor of California. Warships of Great Britain, Holland, Germany, Italy, Japan and the United States were at anchor in the harbor and the soldiers and marines of these nations took part in the great military parade which signalized De Portola's entrance into the city on the opening day of the festival. On other days there were imposing civic, industrial and automobile processions, and on the closing night there was an illuminated pageant, in which were numerous floats depicting many of the stirring scenes in the history of California. The festival was not only a celebration of the discovery of San Francisco Bay, but was also intended to celebrate the marvelous achievements of the city since the fire and earthquake of 1906. Since that disaster over 20,000 new buildings have been erected at a cost of almost \$60,000,000 greater than the value of the original structures. While the city has not yet entirely recovered from the setback sustained at that time, it has now an estimated population of 507,000, or nearly 200,000 more than in 1900.

In May the French government presented to the city a gold medal commemorative of its rebuilding.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below:

An act was passed giving the governing body of school districts the power to establish separate schools for children of Indians and for Chinese or those of Mongolian descent. When such separate schools are established, Indian, Mongolian or Chinese children must not be admitted to any other school. The establishment of fraternities in schools is prohibited. A joint resolution was passed by the Senate and Assembly declaring it right and proper that the people of this country should be advised as to the true position of California on the question of exclusion of Asiatics. It was

resolved also that Congress be respectfully urged to maintain intact the present Chinese exclusion law instead of taking any action looking to repeal, and to extend the terms and provisions thereof so as to apply to all Asiatics, including Japanese. Amendments were made to the statutes relating to divorce. Parents deserting children under the age of 14 years may be punishable by imprisonment in the State prison or in the county jail not exceeding one year, by a fine not exceeding \$500. A child labor law was passed prohibiting the employment of children under sixteen years of age between the hours of ten o'clock in the evening and six o'clock in the morning of the next day. No minor under fourteen years of age shall be employed except with the permission of the judge of the juvenile court. No minor under sixteen years of age shall be employed in any gainful occupation during the hours that public school is in session unless he can read English at sight and write legibly and correctly simple English sentences, and unless he is a regular attendant at a regularly conducted night school. The Juvenile Court was established as a branch of the Superior Court to enforce a law known as the juvenile court law. This law is designed for the protection of delinquent or dependent children. The department of engineering in the State was authorized to carry on topographic surveys and investigations in matters pertaining to the water resources of the State. The State Board of Health was charged with the duty of procuring and distributing free to the people of the State printed matter to demonstrate to them the prevalence of tuberculosis, the danger of infection, and the means of prevention and cure. Measures were adopted providing for increased sanitation in places used for the production of food and a statute was passed making it obligatory on all persons to assist in the extermination of rats. This measure was aimed to destroy the rats along the water fronts, which are supposed to spread the bubonic plague. A measure was enacted regulating the building and occupancy of tenement houses. The hours of labor in mines was limited to eight out of the 24. A measure was passed prohibiting the desecration of the United States flag by using it as an advertisement or otherwise. February 12 was made a legal holiday in the State. Gambling, pool-selling and book-making were prohibited. An act was passed regulating primary elections for the nomination of candidates for various offices, and providing a method whereby electors of political parties may express their choice at such primary elections for United States Senators. Laws of eminent domain were amended. A new law was enacted governing the location of mining claims. The practice of osteopathy and naturopathy was recognized and regulated. A reciprocal demurrage law was enacted and a railroad commission was provided for. A standard form of insurance policy was prescribed.

OFFICERS: Governor, James N. Gillett; Lieutenant-Governor, Warren Porter; Secretary of State, C. F. Curry; Treasurer, W. R. Williams; Comptroller, A. B. Nye; Adjutant-General, J. B. Lauck; Attorney-General, V. S. Webb; Superintendent of Education, Ed. Hyatt—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. H. Beatty; Associate Justices, H. Melvin, Lucien Shaw, F. M. Angellotti, M. C. Sloss,

F. W. Henshaw, W. C. Lorigan; Clerk, F. L. Caughey—all Republicans.

The State Legislature of 1909 was composed of 30 Republicans and 10 Democrats in the Senate, and 60 Republicans and 20 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article *UNITED STATES*.

CALIFORNIA, UNIVERSITY OF. An institution of higher learning at Berkeley, Cal., founded in 1868. The number of students, exclusive of the summer session in 1909, was 3454. The number of officers, exclusive of the summer session, was 322. There were 250,000 volumes in the library. There were received in gifts or endowments during the year, gifts for current use, \$38,263; gifts for the erection of buildings, \$129,901; gifts for endowments, \$161,651; for other purposes, \$3800, or a total of \$333,616. In addition to ten colleges at Berkeley the University includes colleges of law, medicine, dentistry, and pharmacy, an institute of art at San Francisco, the Marine Biological Laboratory at San Diego, and the Lick Observatory at Mount Hamilton. The College of Agriculture includes the United States Agricultural Experiment Station, with sub-stations in various parts of the State, an elaborate system of bulletins and reports and the University Farm at Davis, Yolo County. The University conducts also a summer session, a department of university extension, and issues seventeen series of departmental publications. The endowment of the University is about \$4,300,000 and the income about \$1,200,000, of which something over half came from the State. No tuition is charged to students from California, and non-residents pay \$20 a year. The president is Benjamin Ide Wheeler.

CAMBODIA. A French protectorate in French Indo-China (q. v.). Area, 67,724 square miles; population (1906), 1,193,534. Capital, Pnom-Penh, population, 50,000. The Cambodians (composed of Malays, Chinese, and Annamites) are a docile people; their language and civilization, unlike those of the peoples of the other Indo-Chinese states, are derived from India. The surface of the country is generally level, excepting the wild mountainous tracts of the north; the Malecong River drains it. The chief products are cotton, rice, gum, gamboge, stick lac, cardamom seeds, pepper, indigo, and cinnamon. The cotton yield was estimated in 1908 at 250,000 piculs, or 16,534 tons. Practically the entire output goes to Japan for the manufacture of the celebrated Japanese crêpe, for which its fibre is especially adapted. The pepper production is estimated at 750,000 kilos annually. The chief imports are salt, wine, textiles, and arms; the exports, salt fish, cotton, tobacco, and rice. The external trade is through Saigon, in Cochin-China, though in 1906, 27 vessels of 366,798 tons entered, and 20 of 311,704 tons cleared, at Srée Umbell. The present King, Sisowath, came to the throne in 1904. The French Resident-Superior is M. Luce.

CAMERUN. See KAMEBUN.

CANADA, DOMINION OF. A possession of Great Britain lying north of the United States. The capital is Ottawa.

AREA AND POPULATION. The area in square miles (exclusive of the Canadian portion of the

Great Lakes, the Gulf of St. Lawrence, and the territorial seas) and the population, according to the census of 1901, are stated as follows:

Provinces	Area	Population
Prince Edward Island	2,184	103,259
Nova Scotia	21,428	459,574
New Brunswick	27,985	331,120
Quebec	351,873	1,648,898
Ontario	260,862	2,182,947
Manitoba	73,732	265,211
British Columbia	312,630	178,657
Alberta	253,540	72,841
Saskatchewan	250,650	91,460
Territories:		
Keewatin	516,571	9,800
Yukon	196,976	27,219
Mackenzie	562,182	5,216
Ungava	354,961	5,113
Franklin	500,000
Total	3,745,574	5,371,315

In the foregoing figures, 125,756 square miles are water area. The total estimated population on March 31, 1909, was 7,185,000. In 1901 the natives of Canada numbered 4,671,815; of the British Islands, 390,019; the United States, 127,899; Russia, 31,231; Austria-Hungary, 28,407; Germany, 27,300; and China, 17,043. Roman Catholics numbered 2,229,600; Methodists, 916,886; Presbyterians, 812,442; Anglicans, 680,620; Baptists, 316,477. The number of Indians in 1901 was 99,010; in 1907, 110,345. A special census of the Northwest Provinces in 1906 returned the population of Manitoba as 808,863; Alberta, 185,412; Saskatchewan, 257,763. The larger cities, with population (census of 1901): Montreal, 267,730; Toronto, 208,040; Quebec, 68,840; Ottawa, 59,928; Hamilton, 52,634; Winnipeg, 42,340; Halifax, 40,832; St. John, 40,711; London, 37,981; Vancouver, 26,133; Victoria, 20,816; Kingston, 17,961. In 1909 Montreal, with suburbs, had an estimated population of 476,000; Toronto, with suburbs, 335,000; Ottawa, 90,000 (with suburbs, 100,000); Winnipeg, over 125,000. The estimated population of Canada in 1909 was 7,350,000.

Immigration (declared settlers) for three successive years, ending June 30, is stated as follows:

Country of origin	1906	1907	1908
United Kingdom	86,796	120,779	84,351
Europe (and Iceland)	44,349	56,652	62,860
United States	57,919	74,607	56,860
Total	189,064	252,038	204,071

Chinese immigrants in 1907-8 were reported at 2234. The reported immigration for the six months ending September 30, 1909, was 120,933, showing an increase of 20 per cent. over the corresponding period of 1908. Immigration is directed very largely to the Northwest Provinces, whose large areas, suitable for grain (especially wheat) production, are showing an extraordinary development, to a large extent by emigrants and capital from the United States. It is estimated that in 1909 some 75,000 Americans emigrated to the Northwest Provinces. Figures officially submitted in that year showed that there were still available for homesteads in Manitoba, 17,825,000 acres; in

Saskatchewan, 104,878,000; in Alberta, 117,369,000.

EDUCATION. Public instruction is controlled by the separate provincial governments. Primary instruction in the provinces is free and, except in Quebec and Manitoba, compulsory. In 1908, Alberta had 851 schools (including nine separate schools for Roman Catholics), with 1192 teachers, and 39,653 pupils; expenditure, \$2,636,835. British Columbia, in 1907, had 391 schools, of which 13 were high schools, 65 graded, and 283 common; pupils enrolled, 30,039 (1355 in high schools); teachers, 735; expenditure, \$864,771. In Manitoba there were, in 1907, 1943 schools, with 2480 teachers and 67,144 pupils (including seven high schools, with 3870 pupils). In New Brunswick there were, in 1908, 1767 schools, with 1861 teachers and 60,395 pupils. Nova Scotia had, in 1907, 2465 public schools, with 2626 teachers and 100,000 pupils; total expenditure, \$1,040,805, of which \$277,416 was contributed by the province. In 1908 the public schools in Nova Scotia numbered 2516, with 2664 teachers and 100,105 pupils; pupils in common school grades, 92,190; pupils in high school grades, 7913; in addition there were 271 pupils in government night schools, and 1309 in technical schools; expenditure, \$1,149,304. In Ontario there were, in 1907, 5819 public primary schools, with 8859 teachers (exclusive of kindergarten and night-school

pupils; Roman Catholic classical colleges, 19, with 624 teachers (all male) and 6274 students (all male); universities, 4, with 354 teachers (all male) and 2804 students (2541 male); schools for the deaf, dumb, and blind, 4, with 91 teachers and 507 pupils; schools of art and design, 11, with 50 teachers (male) and 2502 students (male); night schools, 62, with 150 teachers and 6343 pupils. Of the total number of teachers, 2816 were males and 10,323 females. Educational expenditure in the year 1907-8, \$4,707,249.

AGRICULTURE. About 30,000,000 acres are under cultivation. In 1903 the average value of farm land in the Dominion was computed at \$35.70; by provinces the values were: British Columbia, \$76.10; Quebec, \$41.90; Ontario, \$47.30; Prince Edward Island, \$33.70; Manitoba, \$27.30; Nova Scotia, \$25; New Brunswick, \$21.40; Saskatchewan, \$20.40; Alberta, \$18.20.

Of the agricultural products, the grain crops are the most important and are increasing in volume and value the most rapidly. Their increase is especially marked in Manitoba and Saskatchewan; these two provinces produced in 1909 about 138,000,000 bushels of spring wheat, as compared with about 55,000,000 bushels in 1904. The acreage and production of leading crops in the Dominion (exclusive of British Columbia) in 1908 and 1909 are shown in the following table:

Crop	1908		1909	
	Area	Production	Area	Production
Wheat:				
Winter.....	770,400	18,798,000	662,100	18,095,000
Spring.....	5,859,900	93,696,000	7,088,900	150,649,000
Oats.....	7,941,100	250,377,000	9,302,600	855,466,000
Barley.....	1,745,700	46,763,000	1,864,900	55,598,000
Rye.....	100,350	1,711,000	91,300	1,715,000
Buckwheat.....	291,300	7,153,000	282,440	7,806,000
Flaxseed.....	159,500	1,499,000	138,471	2,213,000
Corn (for husking).....	866,200	22,872,000	859,570	19,258,000
Potatoes.....	805,600	73,790,000	515,508	99,097,200
Turnips and other roots.....	271,443	101,248,000	248,047	107,724,000
Hay and clover.....	8,910,900	11,450,000	8,210,500	11,877,100
Fodder corn.....	250,770	2,928,000	209,650	2,779,500
Sugar beets.....	10,800	109,000	10,000	86,000

a Bushels of weight: Wheat, potatoes, and turnips, 60 pounds; rye, corn and flaxseed, 56 pounds; barley and buckwheat, 48 pounds; oats, 34 pounds (the legal weight in Canada).

teachers) and 396,716 pupils; 449 separate schools for Roman Catholics, with 1034 teachers and 51,502 pupils; 5 separate school for Protestants, with 326 pupils; 145 kindergartens, with 15,242 pupils; 20 night schools, with 1552 pupils; 143 high schools, with 750 teachers and 30,331 pupils; 120 continuation schools, with 5317 pupils; total expenditure, \$8,769,876. Prince Edward Island had, in 1907, 479 schools, with 572 teachers and 19,036 pupils; expenditure, \$170,327. In Quebec there were, in 1907, 5592 primary schools, with 6630 teachers and 209,880 pupils; in 1908, 5594 primary schools, with 6668 teachers (6485 females) and 210,543 pupils. In the latter year figures for other schools were as follows: Model schools, 640, with 2914 teachers and 97,032 pupils; academies, 201, with 2192 teachers and 45,369 pupils; normal schools, 7, with 66 teachers and 526 students; schools annexed to normal schools, 7, with 30 teachers and 699

All the provinces, except Ontario, reported considerable increase of agricultural yield in 1909. From the sugar beet crop of 1907 26,057,480 pounds of refined sugar were made (the sugar output is confined practically to Ontario and Alberta). The production of leaf tobacco in 1908 amounted to 11,266,732 pounds (7,655,975 in Quebec and 3,503,739 in Ontario). The approximate value of farm crops in 1908, by provinces (excepting British Columbia), was as follows: Alberta, \$14,000,000; Manitoba, \$66,000,000; New Brunswick, \$28,000,000; Nova Scotia, \$20,000,000; Ontario, \$185,000,000; Prince Edward Island, \$9,408,000; Quebec, \$80,000,000; Saskatchewan, \$37,000,000. The average value of live-stock at the end of 1908 was: Horses (of three years and over), \$143; milch cows, \$34; other cattle (of three years and over), \$32; sheep, \$5.23; swine, \$5.86 per hundred pounds live weight. The total value of farm animals in 1908 was computed at \$530,-

000,000. On June 30 of that year the number of horses was placed at 2,118,165; milch cows, 2,917,746; other cattle, 4,629,836; sheep, 2,831,404; swine, 3,369,858. For the calendar year 1907, returns from 3516 butter and cheese factories, and seven factories producing condensed milk and cream, showed an output of butter amounting to 45,930,294 pounds, valued at \$10,949,042; cheese, 204,788,583 pounds, \$23,597,639; condensed milk and cream, 12,176,135 pounds, with a value, including all products of condenseries, of \$910,842. The value of all dairy products at factories was \$35,457,543, as compared with \$29,731,922 in 1900.

ALBERTA. In 1908 837,050 acres were under crop, including: Spring wheat, 212,677 acres, yielding 4,001,503 bushels; winter wheat, 104,956 acres, 3,093,422 bushels; oats, 431,145 acres, 15,922,974 bushels; barley, 77,876 acres, 1,949,164 bushels. The provincial government operates 24 creameries.

BRITISH COLUMBIA. Only about one-tenth of the available agricultural and fruit lands are at present settled upon. The average annual yield of fruit farm products is \$7,500,000. In 1907 the creameries of the province produced 1,651,304 pounds of butter, and the dairies about 400,000.

MANITOBA. In 1908, 4,987,498 (exclusive of cultivated grasses) acres were under crop. The total grain crop amounted to 113,658,188 bushels, as compared with 99,010,285 bushels in 1907. There were 2,850,640 acres under wheat in 1908, yielding 49,252,539 bushels; other yields in that year were: Oats, 44,686,043 bushels; barley, 18,135,757 bushels; linseed, 502,206; rye, 334,600; peas, 147,033. There were 29,963 acres planted to potatoes, yielding 5,148,696 bushels, and 13,592 under various root crops, yielding 3,419,670 bushels. Under cultivated grasses there were in 1908 125,332 acres, yielding 193,764 tons.

NEW BRUNSWICK. In 1907 the total farm land cleared was 1,664,941 acres, of which 1,087,628 acres were under crop and 16,290 in orchard and garden. The value of agricultural produce in 1909 was \$12,873,480.

NOVA SCOTIA. In 1908 there were 892,900 acres under crop, 1,282,050 acres in pasture, and 54,041 acres in orchard and garden. Hay is the most important crop, yielding annually over 1,000,000 tons. The apple crop is valuable, Nova Scotia apples having a large demand in the English market; the 1908 crop amounted to about 710,000 barrels; the 1909 crop, about 600,000 barrels. Apple shipments from Halifax in 1908 aggregated 615,000 barrels.

ONTARIO. In 1908 the area under crop was 9,621,683 acres; 3,326,189 acres were under pasture and 338,255 acres under orchard and garden. The average production per acre was: Winter wheat, 24.2 bushels; spring wheat, 15.5; barley, 28.5; oats, 34.8; rye, 16.5; peas, 18.7; beans, 16.9; potatoes, 111; turnips, 341; hay, 1.42 tons. Cheese factories numbering 1177 produced 116,695,642 pounds of cheese, valued at \$12,641,055, and 97 creameries made 9,895,109 pounds of butter, valued at \$2,355,170. The number of live-stock was reported as follows: Horses, 726,471; cattle, 2,824,859; sheep, 1,143,898; swine, 1,818,763; poultry, 12,285,613.

PRINCE EDWARD ISLAND. The area under crop in 1907 was 503,579 acres; in orchard and garden, 6077 acres. There were 34,363 horses,

53,096 milch cows, 61,156 other cattle, 111,202 sheep, 55,005 swine, and 720,787 poultry.

QUEBEC. The area under crop in 1907 was 5,250,405 acres; in orchard and garden, 77,416. There were 351,176 horses, 876,135 milch cows, 668,893 other cattle, 626,033 sheep, 729,453 swine, 4,342,241 poultry. In 1908 there were 1392 cheese factories, 627 butter factories, and 736 cheese and butter factories combined. The forest lands of Quebec cover an area of over 100,000,000 acres, and the timber and wood-pulp industries have assumed great importance.

SASKATCHEWAN. Grain (especially wheat) cultivation and cattle raising are the principal industries. Government encouragement is being given to the dairy industry. The area under all field crops in 1906 was 3,271,436 acres. In 1907 2,374,058 acres were under wheat. In 1898 the reported wheat yield was 4,780,440 bushels; in 1908, about 45,000,000 bushels.

MINING AND METALS. The total value stated for mineral products in the Dominion in 1907 was \$86,842,765. In 1908 the total value was approximately \$87,323,849, classified as follows: Metallic products, \$41,655,936; non-metallic products, \$45,367,913 (including structural and clay products valued at \$12,888,907); and products not reported, \$300,000. The quantity and value of the metallic products were: Silver, 22,070,212 ounces, valued at \$11,667,197; gold, \$9,559,274; copper, 64,361,636 pounds, \$8,500,885; nickel, 19,143,111 pounds, \$8,231,538; lead, 45,725,886 pounds, \$1,920,487; pig iron from Canadian ore, 99,420 tons, \$1,664,302; cobalt, 1,853,286 pounds, \$112,253. The total output of pig iron in 1908 was 630,835 tons, valued at \$8,111,194, of which 521,416 tons, valued at \$6,446,892, was produced from imported ore. The more important of the non-metallic products in 1908 were: Coal, 10,904,466 tons, valued at \$26,567,235; Portland cement, 2,655,289 barrels, \$3,709,063; asbestos, 65,534 tons, \$2,547,507; natural gas, \$1,012,060; petroleum, 527,987 barrels, \$747,100; gypsum, 340,964 tons, \$575,701; sewer pipe, \$514,042; calcium carbide, 6864 tons, \$417,150; limestone for flux, 418,661, \$289,705; clay products, stone, lime, etc., estimated at \$8,500,000.

In Alberta the coal output in 1908 was placed at 1,845,000 tons. In British Columbia gold production in 1907 was valued at \$4,883,020; coal production in 1908, 2,329,000 tons; silver, in 1907, \$1,793,519; the average annual yield of all minerals is \$25,800,000. In New Brunswick the 1908 coal output amounted to 60,000 tons. In Nova Scotia, for the year ending September 30, 1908, the coal output was 6,299,282 tons; coke, 505,003; gypsum, 242,535; copper ore, 1200; iron ore, 30,575; pig iron (mostly from imported ore), 326,303; cement, 44,529 barrels; gold, 11,990 ounces; limestone, 484,685 tons. In Ontario the total mineral production in 1908 was valued at \$25,219,000, as compared with \$25,019,373 in 1907 and \$11,572,647 in 1904. In 1908 metallic production was valued at \$17,160,813, as compared with \$14,550,835 in 1907. The leading values in 1908 included: Silver, \$9,125,903; pig iron (mostly from imported ore), \$4,390,839; nickel, \$1,866,059; copper, \$1,071,140; iron ore, \$536,369; gold, \$60,337; Portland cement, \$2,417,769; petroleum, \$703,773; salt, \$488,330. From the province of Quebec comes most of the asbestos produced in North America. In Saskatchewan the coal output in 1908 amounted

to 130,000 tons; gold production, which reached \$55,000 in 1896, has declined to a negligible quantity. In the Territory of Yukon the gold output, which reached \$22,275,000 in 1900, was \$3,600,000 in 1908; the coal production in 1907 was 15,000 tons; the silver production, which reached \$177,857 in 1900, was \$23,510 in 1907.

In 1909 a report based upon recent surveys and estimates of the Crow's Nest Pass coal field, which is crossed by the Alberta-Manitoba boundary, placed the amount of marketable coal in the field at upwards of 45,000,000,000 tons, showing it to be the most extensive field of coal in Western North America; for the most part the coal is bituminous.

FISHERIES. The total value of the Canadian catch in 1906 was placed at \$26,279,485; in 1907, \$25,499,349. The values of the catch by provinces for the two years respectively, were: British Columbia, \$7,003,347 and \$6,122,923; Manitoba, Alberta, and Saskatchewan, \$1,492,923 and \$968,422; New Brunswick, \$4,905,225 and \$5,300,564; Nova Scotia, \$7,799,160 and \$7,632,330; Ontario, \$1,734,856 and \$1,935,025; Prince Edward Island, \$1,168,939 and \$1,492,695; Quebec, \$2,175,035 and \$2,047,390. The leading values in the 1907 catch were: Dried cod, \$3,372,516 (the total value for cod—dried, fresh, and tongues and sounds—was \$3,619,817); preserved salmon, \$3,280,728; preserved lobsters, \$3,198,172; salted herring, \$1,302,698; fresh salmon, \$945,222; live or fresh lobsters, \$885,950; fresh halibut, \$841,387; smelts, \$775,866; whitefish, \$688,406; trout, \$676,892; salted mackerel, \$633,105; coarse and mixed fish, \$670,476; pickerel, \$586,489; fresh herring, \$546,002; dried hake, \$524,148. In 1907 the leading values of the catch in the several provinces were: British Columbia: preserved salmon, \$3,278,512; pickled and dry salted salmon, \$732,305; Manitoba, Alberta, and Saskatchewan: whitefish, \$363,150; pickerel, \$251,075; New Brunswick: lobsters, \$928,514 (preserved, \$819,304); herring (salted, smoked, kippered, and fresh), \$916,060 (salted, \$716,790); smelts, \$667,932; dried cod, \$404,610; Nova Scotia: lobsters, \$2,052,354 (preserved, \$1,281,104); dried cod, \$2,000,560; herring (salted, fresh, and smoked), \$496,126 (salted, \$412,587); Ontario: trout, \$586,873; whitefish, \$320,419; pickerel, \$319,225; Prince Edward Island: lobsters, \$867,947 (preserved, \$851,847); clams, \$100,362; Quebec: dried cod, \$875,331; lobsters, \$246,367 (preserved \$245,917).

MANUFACTURES. The Canadian census of manufactures, taken in 1906 and covering the calendar year 1905, shows the following distribution by provinces:

Establishments	Capital	Value of Products
Canada	15,796	\$846,585,023
Alberta	120	5,545,821
British Columbia..	459	53,022,033
Manitoba	354	27,517,297
New Brunswick...	628	26,792,698
Nova Scotia	909	75,089,191
Ontario	7,996	397,484,705
Prince Edward I...	285	1,680,541
Quebec	4,965	255,479,662
Saskatchewan	80	3,973,075
		2,520,172

In 1905 (the latest year for which statistics for the whole Dominion were available), the values of the leading industrial products were:

Log products, \$69,084,920; flour and grist mill products, \$56,703,269; butter and cheese, \$32,402,205; smelting, \$28,426,388; slaughtering and meat packing, \$27,220,363; foundry and machine-shop products, \$24,013,094; lumber products, \$21,078,158; boots and shoes, \$20,264,686; refined sugar, \$18,268,260; leather (tanned, curried, and finished), \$15,142,217; cars and car works, \$14,430,190; cotton textiles, \$14,223,447; clay, glass, and stone products, \$13,986,000; printing and publishing, \$13,038,104; agricultural implements, \$12,835,748.

FOREIGN COMMERCE. Canadian trade for the year ending June 30, 1906, the nine months ending March 31, 1907, and the years ending March 31, 1908 and 1909 has been valued as follows:

	Imports for Home Consump.	Total Imports	Total Exports
1906	\$290,360,807	\$294,286,015	\$256,586,630
1907	257,254,882	259,786,007	205,277,197
1908	358,428,616	370,786,525	280,006,606
1909	298,206,957	309,756,608	261,512,159

The imports for home consumption in the fiscal year 1908 consisted of merchandise valued at \$351,824,024 and coin and bullion amounting to \$6,548,661; in 1909, merchandise, \$288,135,350, and coin and bullion \$9,988,442. The total exports in the fiscal year 1908 consisted of domestic merchandise valued at \$246,960,968, foreign merchandise \$16,407,984, and coin and bullion \$16,637,654; in 1909, domestic merchandise, \$242,603,584, foreign merchandise \$17,318,782, and coin and bullion \$1,589,793. Dutiable imports in the fiscal year 1908 were valued at \$230,917,914, and free imports \$133,319,950; in 1909, \$185,329,094 and \$114,439,072 respectively. The total import duties in the former year amounted to \$58,331,074; in 1909, \$48,059,792.

In the fiscal year 1909 the larger classes of dutiable imports entered for consumption included: Iron and steel and their manufactures, \$33,083,397; woolen manufactures, \$15,833,254; coal, \$13,151,449; sugars and syrups, \$12,494,113; cotton manufactures, \$11,469,095; silk and silk manufactures, \$4,275,694; fruits and nuts, \$4,198,991; paper and paper manufactures, \$3,581,807; leather and leather manufactures, \$3,116,322; spirits, \$2,734,553; drugs, dyes, chemicals, and medicines, \$2,509,422; flax, hemp, and mineral oils, \$2,459,017; jute manufactures, \$2,447,512; hats, caps, bonnets, etc., \$2,275,163; glass and glass manufactures, \$2,245,150; meats, \$2,107,474; earthenware, \$1,716,887; wood and wood manufactures, \$1,608,635; carriages and vehicles, \$1,330,312; seeds, \$1,170,140; rubber and gutta percha manufactures, \$901,575. In 1909 the larger classes of free imports entered for consumption included: Mineral products, \$18,029,217; animals and animal produce, \$11,200,076; coin and bullion, \$9,988,442; drugs, dyes, chemicals, and medicines, \$6,910,473; forest products, \$6,176,005 (lumber, \$4,453,948); tea, \$5,045,055; green fruit, \$4,113,290; unmanufactured tobacco, \$3,436,178; tin manufactures, \$2,748,138; rubber, \$2,485,073; copper manufactures, \$2,351,153; mineral and vegetable oils, \$2,110,029; fishery products, \$925,173; molasses and syrup, \$878,418; green coffee, \$828,394; books and maps, \$816,819.

The following table shows by great classes the export values in the fiscal year 1909:

	Canadian Produce	Foreign Produce
Produce of mine	\$ 37,257,699	\$ 306,189
Produce of fisheries	13,319,664	28,314
Produce of forest	39,667,387	225,963
Animals and their produce	61,349,646	677,064
Agricultural products	71,997,207	10,746,719
Manufactures	28,957,050	3,997,130
Miscellaneous articles	54,931	1,337,414
Total	\$242,603,584	\$17,318,782
Coin and bullion	2	1,589,791
Grand total	\$242,603,586	\$18,908,573

The leading articles of domestic exports (that is, Canadian produce) in the fiscal year 1909 were valued as follows: Grain, \$53,782,629 (including: wheat, \$48,147,942; oats, \$2,175,765; barley, \$1,744,687); lumber, \$32,379,809; cheese, \$20,384,666; silver, \$13,284,084; living animals, \$11,798,028; meats, \$9,984,425 (bacon, \$8,414,049); flour and meal, \$8,590,286 (wheat flour, \$7,991,413); gold-bearing quartz, dust, nuggets, etc., \$7,293,420; copper, \$6,406,528; wood manufactures, \$5,081,221 (pulp, \$4,306,929); wood for pulp, \$4,356,391; hides and skins (other than furs), \$4,029,676; paper, \$3,469,713; codfish, \$3,348,149; lobsters, \$3,218,466; salmon, \$3,002,311; furs, \$2,503,411; iron and steel and their manufactures, \$2,479,284; leather and leather manufactures, \$2,369,557; alcoholic liquors, \$1,127,482.

In the fiscal year 1909 the values of imports for home consumption and of domestic exports, by countries, are shown in the following table:

Countries	Imports from	Exports to
United States	\$180,026,550	\$ 85,334,806
Great Britain	70,682,944	126,384,726
France	8,197,435	2,341,507
British West Indies	7,543,733	2,513,695
Germany	6,050,365	1,456,379
British East Indies	3,072,012	329,207
Switzerland	2,188,265	6,012
Japan	1,985,868	756,033
Belgium	1,901,588	2,699,162
Austria-Hungary	1,669,778	15,000
Newfoundland	1,638,428	3,392,168
Argentina	1,637,388	1,867,676
Netherlands	1,273,121	913,177
Spain	933,854	45,655
Italy	761,339	581,873
Dutch East Indies	672,638	
China	640,868	1,021,772
Cuba	488,664	1,388,004
Total, including all other countries	\$298,205,957	\$242,603,586

For the fiscal year 1909, the values of total imports and total exports, by provinces, were as follows:

Provinces	Imports to	Exports from
Ontario	\$132,384,595	\$ 69,038,570
Quebec	107,122,361	119,937,889
British Columbia	20,898,381	22,240,699
Manitoba	17,530,073	2,176,829
Nova Scotia	13,257,960	17,363,405
New Brunswick	9,508,306	27,214,741
Alberta	3,761,467	186,632
Saskatchewan	3,415,708	1,923,807
Prince Edward Island	582,718	523,093
Yukon Territory	1,209,780	906,473
Other Territories	3,094
Total	\$309,674,443	\$261,512,159
British prepaid postal parcels	82,165
Grand Total	\$309,756,608	\$261,512,159

For the six months ending September 30, 1909, the imports for home consumption and the exports were valued at \$173,200,432 and \$131,189,656 respectively, as compared with \$142,461,754 and \$118,706,898 respectively in the corresponding period of 1908.

SHIPPING. The registered tonnage of vessels entered and cleared (exclusive of those in the coasting trade) in the fiscal year ending March 31, 1908, was 39,575,031; in 1909, 40,701,603. In the coasting trade the tonnage in the fiscal year 1908 was 50,529,835; in 1909, 52,670,198. In the latter year the entrances of sea-going vessels in the foreign trade numbered 15,140, of 10,264,187 tons (7,009,768 British, 1,793,095 American, 961,193 Norwegian and Swedish); clearances, 15,042, of 9,501,689 tons (6,201,880 British, 1,788,372 American, 995,089 Norwegian and Swedish). Of the entrances, 8249, of 9,228,798 tons, were steamers, and 6891, of 1,035,391 tons, were sailing vessels. Of the clearances, 7933, of 8,577,290 tons, were steamers and 7109, of 924,399 tons were sailing vessels. Of the tonnage entered in the trade on rivers and lakes between Canada and the United States, 5,781,812 was Canadian and 4,845,064 American; cleared, 5,217,700 Canadian and 5,091,151 American.

COMMUNICATIONS. The following statistics of Canadian railways refer to the years ending June 30, 1907, and 1908 respectively: Miles in operation, 22,452 and 22,968; gross earnings, \$146,738,214 and \$146,918,314 (from freight traffic, \$94,995,087 and \$93,746,655; from passenger traffic, \$39,184,438 and \$39,992,503); operating expenses, \$103,748,672 and \$107,304,143; net earnings, \$42,989,542 and \$39,614,171; freight carried, 63,866,135 tons and 63,071,167 tons; passengers carried, 32,137,319 and 34,044,992. In 1909 a considerable mileage was added to the railways. A line down the Nelson River valley is projected and partially surveyed to Hudson Bay. Canada has an extensive system of canal, river, and lake navigation. The following statistics of canals refer to the year ending June 30, 1907: Vessels passing through, 38,161, of 17,933,745 tons (Canadian, 28,833 vessels, of 6,328,911 tons; American, 9328, of 11,804,834 tons); freight carried, 20,543,639 tons; passengers carried, 279,199; for the year ending June 30, 1908: Vessels passing through, 36,529, of 15,301,928 tons (Canadian, 29,040, of 6,780,789 tons; American, 7489, of 8,521,139 tons); freight carried, 17,502,820 tons; passengers carried, 280,830. The length of telegraph lines in 1907 was 32,455 miles. The post-offices on March 31, 1907, numbered 11,377.

FINANCE. The government financial accounts comprising the general sources of revenue and branches of expenditure are kept under the heading "Consolidated Fund." The following statistics relate to the fiscal years ending March 31, 1908 and 1909 respectively: Consolidated Fund revenue, \$96,054,506 and \$85,093,404; other revenue, \$911 and \$456,176; total revenue, \$96,055,417 and \$85,549,580;—expenditure chargeable to Consolidated Fund, \$76,641,452 and \$84,064,232; expenditure chargeable to "Capital," \$30,429,907 and \$42,593,167; railway subsidies, \$2,037,629 and \$1,785,887; other expenditures, \$3,469,692 and \$4,998,238; total expenditure, \$112,578,680 and \$133,441,524, the expenditure for the two years including sinking fund deposits of \$2,234,263 and \$1,922,525 respectively. For the fiscal year 1908-9 the principal sources of revenue were: Customs, \$47,

415,325; excise, \$14,937,768; public works, including railways and canals, \$9,362,272; posts, \$7,401,624; interest on investments, \$2,256,643; Dominion lands, \$2,153,255. In the same year the leading items of expenditure, on account of Consolidated Fund, were: Interest on the public debt, \$11,604,584; public works (not including railways and canals), \$12,300,184; militia and defense, \$5,221,645; subsidies to provinces, \$9,117,143; lighthouse and coast service, \$2,721,802. The principal expenditures chargeable to "Capital," in 1908-9, were: Railways, \$35,846,185 (National Transcontinental Railway, \$24,892,351); canals, \$1,873,868 (Trent canal, \$1,099,836). The public net debt on March 31, 1908, stood at \$277,960,860; on March 31, 1909, \$233,930,279.

BANKS. On June 30, 1909, the Canadian chartered banks had an aggregate paid-up capital of \$97,436,427; deposits, \$681,658,944; assets, \$1,053,271,919; liabilities, \$870,192,322. Chartered-bank clearings in the calendar year 1908, aggregated \$4,142,114,000. On June 30, 1909, deposits in post-office savings banks amounted to \$44,568,683; government savings banks (except post-office banks), \$14,558,878; special savings banks, \$30,258,585; total deposits (including those in chartered banks), \$771,043,090. The note circulation, June 30, 1909, was: Chartered-bank notes, \$70,170,491; Dominion notes, \$79,005,301.

ARMY. Every Canadian between the ages of 18 and 60 is liable for military service, the male inhabitant being divided into four classes from a point of age, and whether married or single. There are 13 military districts and an organization was planned under the militia act of 1904. As yet there has been no compulsory service or enlistment and the forces consist of a permanent militia and an active militia in training. By the plan of reorganization adopted it was planned to have a line of first defense of 100,000 men, and maintain such a peace establishment that an addition of one-third its strength would put it on a war footing. The permanent force would be maintained as a means of instruction and would have a strength of 5000 men. The establishment provided in addition: Mounted troops, peace 3100, war 8000; field artillery, peace, 2000, war, 3470; infantry, peace, 35,000, war, 90,000. The total establishment of the organized militia was estimated at 3000 officers, 41,000 men, and 7800 horses on a peace basis, and 5000 officers, 100,000 men and 17,500 horses on a war footing in addition to 14,000 members of rifle clubs.

NAVY. The naval defense of Canada is entrusted at present to the Imperial authorities. In 1909 it was reported that in the following year the Canadian government would begin the construction of a fleet and the organization of a naval reserve. See paragraph on *History*.

GOVERNMENT. The executive authority is vested in the British sovereign acting through a governor-general, who is assisted by a privy council, or cabinet, of 14 members. The legislative power devolves upon a parliament of two houses, the Senate (87 members, nominated for life by the Governor-General) and the House of Commons (214 members, elected by popular vote for five years, unless the House is sooner dissolved). The Governor-General in 1909 (appointed September, 1904) was Sir Albert Henry George, Earl Grey. The Privy Council in 1909 was constituted as follows: Prime Minister

and President of the Council, Sir Wilfrid Laurier; Secretary of State, Charles Murphy; Minister of Trade and Commerce, Sir Richard John Cartwright; Minister of Justice and Attorney-General, A. B. Aylesworth; Minister of Marine and Fisheries, Louis Philippe Brodeur; Minister of Railways and Canals, George Perry Graham; Minister of Militia and Defense, Sir Frederick W. Borden; Minister of Finance, William S. Fielding; Postmaster-General and Minister of Labor, Rodolphe Lemieux; Minister of Agriculture, Sydney Arthur Fisher; Minister of Public Works, William Pugsley; Minister of Interior, Frank Oliver; Minister of Customs, William Patterson; Minister of Inland Revenue, William Templeman.

Each province has a separate administration and legislature. The executive is vested in a lieutenant-governor, who is appointed by the Governor-General and is assisted by a responsible ministry. In Quebec and Nova Scotia the legislature is bicameral, in the other provinces unicameral.

HISTORY.

QUESTIONS PENDING BETWEEN CANADA AND THE UNITED STATES. On January 11, 1909 the Waterways Treaty for the division and control of the waterways on the boundary between the two countries was signed by the British Ambassador and the American Secretary of State. Among the disputed points which it aimed to settle were the navigation problems of the Great Lakes, the rival claims in the matter of the Niagara water power and the questions as to the use of water for reclamation and other purposes. It allowed Canada 36,000 cubic feet per second from the Niagara and the United States 20,000 cubic feet, and it prohibited either country from doing anything to change the water level of the Great Lakes without the consent of the International Waterways Commission. It was to last five years. It now awaited ratification. Some differences arising, a conference was held early in April. A rider put on it by the United States Senate, dealing with riparian rights on the St. Mary's rapids, encountered objection in Canada, but this was overcome by the American provision for the purchase of these rights. Nevertheless the treaty was still awaiting Canada's ratification in December. In July the International Waterways Commission after three years' consideration decided adversely on the proposal to dam Lake Erie's outlet into the Niagara, on the ground that it would have a bad effect on navigation. As to the Newfoundland fisheries, an agreement was signed at Washington on January 27, and ratified on February 18, for reference of the dispute to the Hague Tribunal. The Newfoundland government at first dissented, but subsequently acquiesced. The arbitration court was to decide on seven questions, some of which concern Canada no less than Newfoundland. Canadian interests, for example, are especially involved in the fifth question which concerns the dispute as to the point from which the three marine miles referred to in the Convention of 1818 should be measured, the Americans contending for the right to measure from any point of the British North American shore, and the Canadians insisting on an imaginary line from one headland to another. On the opening of Parliament November 11, Sir Wilfrid Laurier announced that the government was practically

agreed as to the Waterways Treaty, but that there was one point to which they wished to give further consideration. The ratification of the French Treaty was also pending at this time. The leader of the Opposition, in the debate following the address, demanded careful consideration of the question whether the ratification might not cause the United States to apply the maximum clause in the Payne tariff to Canadian imports. The Premier replied that he did not think there was any danger of this, since, in his opinion, the agreement with France did not discriminate against the United States. In August it was announced that the regulations drawn up by the American and Canadian Commissioners as to the fisheries in inland waters would be published in December, but would not go into effect till January, 1911.

GOVERNMENT'S POLICY. The revised figures for the general elections of 1908 were published in January, 1909. The total vote was 1,176,104, as compared with 1,014,413 in 1904; the Liberal vote 596,533; the Conservative 579,571; the Independent 26,250. One of the features of the campaign of 1908 was the complaint of members of the woollen trade as to inadequate protection, which drew from Sir Wilfrid Laurier the promise to investigate the industry through a commissioner, who would be sent to England, and to accord further protection if it was found necessary. Early in January, 1909, the Commissioner reported that the existing duties were sufficient if the Canadian producers would adopt the technical methods that were employed in the Yorkshire industry. Another feature in the election campaign of 1908 had been the scandals in the Departments of Marine, an investigation of which was ordered by the government. The report of Judge Cassels exonerated the Lighthouse Board and the Ministers, but censured certain officials for collecting tolls from contractors. It was suggested that a new Purchasing Board be created to buy all the supplies for the public service. Later twenty-two officials were dismissed as a result of the misconduct brought to light in the investigation. The Speech from the Throne declared that as a result of the amendment to the Dominion Land Act, passed in the previous session, which provided for the sale of pre-emptions and purchased homesteads, the revenue was sufficient for the building of the proposed railway between the western wheat country and Hudson Bay. Exploration and surveying parties had already been sent out to determine as to a feasible route. An important government measure was the bill for the amendment of the Immigration Act to provide for the removal of undesirable immigrants by means of closer supervision at ports of embarkation, on board the ships and at the ports of arrival. It extended the time within which immigrants might be deported from two to three years. The government proposed a Department of External Affairs to have charge of all correspondence with the Imperial government, the sister colonies and the British Ambassador to the United States. As in the United States, public opinion was deeply disturbed by the destruction of the forests. The government was urged by the Forestry Congress to appoint a royal commissioner to investigate forestry conditions. Lord Grey on this occasion emphasized the need of putting a stop to the wanton destruction of the forests,

and pointed as a warning to the experience of the United States, which, he said, had suffered a loss estimated at £200,000,000 through its negligence in the matter. By a convention with France early in the year the subsidy for direct steamship service between the two countries was raised from £15,000 to £40,000. On March 12 the Daylight Saving Bill was introduced in the House of Commons, providing that from April 2 to October 2 local time should be observed one hour ahead of standard time in all the provinces except Yukon. It was referred to a committee, which late in the following month reported favorably upon it. A Parliament and Commission was appointed in March to investigate the different systems of proportional representation. In March Lord Strathcona presented the Dominion with £50,000 for a scheme for the physical training of school children. Other matters of importance under the consideration of Parliament were national defense and railway development, which are discussed in the succeeding paragraphs. For the budget, see paragraph on *Other Events*.

During the closing months of the year there was much discussion of the defense policy. In the first week in November the Trades Congress of Quebec passed a resolution condemning the spread of militarism in Canada and the establishment of a Canadian navy. To the delegation who presented this resolution, the Premier replied that although he was a champion of peace, he felt that it was impossible to do away with armies and navies. Attacks were also made upon the government's naval programme by the leader of the Conservative party in Quebec, Mr. Monk, who declared it a new departure. He said that the project should first be submitted to the electors, that to construct a navy now would drain Canada's resources, and that such a navy would be of no use as an aid to Great Britain's naval supremacy. He said that if Canada adopted the project of Imperial armament for Imperial purposes she must take her place in the concert of European nations who were already groaning under the burden of military and naval expenditures.

DEFENSE. The scheme of the British Secretary of State for War, Mr. Haldane, for a General Staff, was approved by the Canadian government subject to the latter's continued control of the Canadian division of the Staff. The subject of national defense was much discussed during the year, and there were signs of strong public sentiment in favor of Canadian participation in a scheme for Imperial defense. Mr. Foster moved in the House of Commons on March 29 that Canada should assume a fair share of the burden of defending the coast and seaports. His motion was adopted with some amendments. The duty of assuming a larger share of responsibility in the matter of national defense was recognized, but it was held that the best means to that end were not at present regular periodical contributions to the Imperial treasury. The House declared that it would approve expenditures for the purpose of organizing promptly a Canadian naval service in close relations to the Imperial navy, and that it held to the view that British naval supremacy was essential to Imperial interests. The government measure for the organizing of a naval militia was promised for this session. The discussion of national defense in co-operation with Great Britain continued in the press,

and on March 19 Sir Wilfrid Laurier announced in a speech the government's intentions in the matter. He admitted that the resolution passed earlier in the session was unsatisfactory. He did not, however, approve the proposal of the advanced wing for the granting of money to Great Britain to strengthen the navy. Canada, he thought, should provide for her own defense. The British naval authorities with whom he consulted after the passage of the resolution, were of the opinion that Canada should form no part of the Imperial organization, but that no action should be taken except according to the views of the Admiralty. Among the public at large feeling on behalf of Imperial defense appeared to be gaining strength and though encouraged by the government's declaration and the resolution of Parliament, there was a general demand that prompt action should be taken. Sir Wilfrid Laurier's speech indicated a modification of his earlier opinions which had been strongly against anything that savored of militarism. An important feature of the government's naval plan was the making of the Canadian vessels interchangeable with those of the home country. In the debate on the address which followed the opening of Parliament on November 11, Sir Wilfrid Laurier declared that Parliament had unanimously committed itself to the organization of a Canadian navy. During the later months of 1909 the Canadian government was in negotiation with the Admiralty concerning the personnel of the proposed Canadian navy. The loan of seamen from the Imperial navy to form a nucleus of the crews of the new Canadian vessels was one of the projects discussed. New military corps were formed in the western provinces. In the latter part of the year there was an awakened interest in military defense as well.

RAILWAY DEVELOPMENT. In 1909 as in the preceding year the progress of railway construction was very considerable. A new line was planned from Edmonton to Fort MacMurray on the Athabasca. The government expenditures on account of railways were very heavy. In the budget speech of April 20, the Minister of Finance, Mr. Fielding, declared that the increase of the net debt was \$46,029,000, of which \$32,000 was charged to the national trans-continental railway and the Quebec bridge. Railway construction was especially rapid in Western Canada, where it was expected that by midsummer 1635 miles of line of the Grand Trunk between Fort William and Edmonton would be finished in time to enable the railway to carry a large part of the season's crops. A bill for a loan of £2,000,000 to the Grand Trunk was read for the third time in the Commons on April 3. In the case of the Dawson Board of Trade vs. the Yukon and White Pass Railway Company, the court decided that under the amendment of the Railway act passed in the last session of Parliament, all railways were under the jurisdiction of the Board of Trade, even if they started in the United States.

Discussion of the "All Red Route" continued during the year. The original proposal was made at the Imperial Conference in London in 1907, when Sir Wilfrid Laurier carried through a resolution for an "all red" British steamship line to connect Great Britain and her colonies with the Far East. In July, 1908, the

Canadian Parliament passed a resolution declaring that Canada would assume her share of the subsidy for the route, and urging the other colonies to prompt action. A committee was appointed to consider means of overcoming difficulties in the way of the project, with the right to call expert witnesses. In July, 1909, the British Premier, Mr. Asquith, announced that the committee had not yet succeeded in removing these obstacles.

IMMIGRATION. The immigration season began actively with over 1800 arrivals in Montreal in the space of two days. During the previous year, that is down to March 31, 1908, the immigrants numbered 146,908, as against 262,467 in the year before, and showed a slight increase from the United States, and a falling off from Great Britain of sixty per cent. In recent years Canada had experienced the usual difficulty from the influx of undesirable immigrants, and the government introduced a measure for making the rules as to removal more stringent (see preceding paragraph). Mr. Mackenzie King, the Canadian representative to the Opium Trade Conference, issued his report on the investigation of Oriental immigration. This indicated that conditions were satisfactory, that Mr. Lemieux's agreement with Japan was respected by the Japanese, and that the arrangement made in the previous year with India was working well. Mr. King reported that the head tax of \$500 on Chinese immigrants served as an effective barrier, but that it seemed as if less offensive means could be found. In August it appeared from the official reports that for the first time in two years British immigration showed an actual increase. On the other hand the increase of immigration from the United States was much greater. In the latter part of August the arrivals from the United States were already heavier than the year before, when they numbered 60,000, and it was expected that before the close of the year they would reach the figure 75,000. Toward the end of September it appeared that for the first time in the history of Canada the immigration from the United States exceeded that from the United Kingdom—59,832 against 52,901. Another important fact in the movement of population during the year was that for the first time in many years, according to the annual report of the Department of Indian Affairs, the Indian population showed an increase. Its total, according to the report, was 111,043. The Canadian authorities had long felt the necessity of promoting the immigration of desirable classes of settlers from Great Britain. To this end Mr. Oliver, the Minister of the Interior, paid a visit to England to inspect the Canadian Immigration Agency. Mr. James, Deputy Minister of Agriculture in Ontario, also visited England to promote immigration to Ontario.

OTHER EVENTS. According to the budget speech of April 20, there was a surplus on March 31, the end of the fiscal year, of \$1,350,000. The total trade of the year was \$553,737,000, a decrease of \$97,000,000 from the year before, chiefly in imports. The estimated expenditure for the current year was \$80,078,624. The Minister of Finance declared there was no need of increased taxation, but of substantial reduction of the expenditures. In the summer there were signs that the year would be one of marked commercial and agricultural

prosperity. The correspondents of the Labor Departments from the industrial centres agreed in their comments on the favorable prospects. An important question of labor organization was raised by the strike in the Dominion Coal Company at Glace Bay on July 6. The strikers belonged to the United States United Mine Workers and hostile to the Provincial Workers' Association, which was on good terms with the company. The demand was for better labor conditions. Another instance of the power of the United Mine Workers of America was the strike of 1500 miners of the Cumberland mine at Spring Hill, Nova Scotia, on August 31 (see **STRIKES**). On the passage of the new tariff act by the United States there was talk of retaliatory action on the part of Canada (see **TARIFF**). It was urged that unmanufactured lumber ought not to be exported from Canada, and that if the provincial governments did not put an end to this export trade Parliament ought to levy a heavy duty on it. This policy had long been advocated by the Canadian paper manufacturers. The Quebec government decided that the export of lumber from Quebec must soon be stopped. During 1908, 901,861 cords had been exported to the United States from Quebec alone. Early in September the Quebec Premier repeated the assurance that the government would retort against the United States tariff by an export duty on pulpwood. The International Congress of Women was opened at the University of Toronto on June 11, comprising 150 delegates representing Great Britain, the United States, Germany, Canada, Australia, Netherlands, Norway, Sweden, Austria-Hungary, Belgium, Italy and Greece. Among its important resolutions was one to form a standing committee to aid emigrants, especially women and children, and a standing committee on education; also for national councils which should promote the use of school books presenting historical facts fairly and arousing interest in the peaceful settlement of international disputes. The next quinquennial council was to be held at Rome in 1914. At a meeting of the Manufacturers' Association in September, resolutions were passed approving Parliament's decision to appropriate money for Imperial defense and urging the establishment of a permanent government tariff, protesting against the clause in the Insurance Act passed in the previous session, which taxed insurance companies outside Canada, and favoring the prohibition of exports of logs and pulp wood. For some time past an important movement had been in progress for the consolidation of the maritime provinces. The conference of the Boards of Trade in these provinces was held at Charlottetown in August and adopted a resolution in favor of a Union. The governments of Nova Scotia, New Brunswick and Prince Edward Island were asked to appoint a committee to draft a plan.

The exposure of corruption in municipal affairs had greatly aroused public opinion during the year on behalf of the establishment of Boards of Control, consisting of five members elected by the city, who, along with the Mayor, would administer municipal affairs, while the City Council would only legislate. This system had already been tried with good results in Ottawa, Winnipeg, Toronto and other cities. In September

Montreal voted by a large majority for such a civic cabinet, electing a Board of Control for administration only and reducing the number of legislative aldermen. The plan was supported by all the leading papers. The supervision of the Battlefields Commission, which was appointed in 1908 to preserve the Plains of Abraham for the celebration of that year, was extended to the care of all the battlefields throughout Canada. An Empire Fair was opened by Lord Gray at Ottawa on April 2. Great damage was done in the spring by the choking up of the Niagara River with ice, obliging the power companies to shut down. There were some difficulties in northern British Columbia with the Indians in the summer. They showed a hostile temper and endeavored to drive the surveyors away from Hazelton. The Commercial Convention with France whereby Canada in return for the benefit of the French minimum tariff conceded to France the Canadian intermediate tariff on some articles and a special tariff on others was ratified by France in April. A supplementary trade convention between the two countries was signed in January, 1909. The bill ratifying it was read for the third time in the Canadian House of Commons at the close of November, and received the Royal assent on December 4. For fisheries dispute with United States see **ABSTRACTION, INTERNATIONAL**, and **UNITED STATES**, paragraph on *Foreign Relations*. See also **EXPLORATION**.

CANADIAN CANAL. See **CANALS**.

CANADIAN CONFERENCE OF CHARITIES AND CORRECTIONS. See **CHARITY ORGANIZATION**.

CANALS. An interesting event of the year 1909 was the celebration of the jubilee of the Suez Canal, work on which was begun in April, 1859, while the canal itself was thrown open for navigation in 1869. The depth of the canal then was 26½ ft., which has since been increased to 33 ft., and this was being further deepened to 34½. At the same time the bottom width has been increased from 72 to 98½ feet. The tonnage passing through the canal has grown from 2,940,708 in the first year to 19,110,831 for 1908 and the average gross tonnage of vessels has increased from 1348 to 5038, while the time of passage has been reduced from 48 to 17½ hours, to which electric lighting has in large part contributed. The canal was used in 1909 by 2194 British vessels, 583 Jamaica, 243 Dutch and 238 French. In addition to the dredging of the canal proper other important work in progress in 1909 included the deepening of the entrance channel and mooring basin at Aden from 26 to 30½ feet at an estimated cost of about \$400,000. The enlarged mooring was designed to accommodate from twelve to fifteen of the largest ships using the canal.

On June 22, a beginning actually was made on the long discussed Cape Cod Canal, which was to extend from Sandwich on Barnstable Bay, on the Massachusetts Bay side, to Buzzard's Bay, a total distance of 8 miles of land and 4 miles to be deepened in the two bays. There is a difference in height of tide in the canal but no lock is contemplated. The excavation was being carried on by ladder and dipper dredges and suction dredges were to be used for the softer material. At the Atlantic entrance an artificial harbor protected by breakwaters was con-

templated. The canal is to have a surface width of 300 feet and a depth of 25 feet at low water.

The New York State Barge Canal System, which was provided for by the laws of 1903 and for which \$101,000,000 was appropriated, made considerable advance in the year 1909, and on November 30 the work under contract covered a distance of 295.3 miles, and additional plans were completed for 61.6 miles. Plans for much of the remainder were under way and at the end of the year it was estimated that contracts providing for the construction of 315.08 miles of canal had been let. The total length of the barge canal system, which involves the improvement of the Erie, Oswego and Champlain canals, making a waterway 12 feet in depth, is 431 miles, of which 27 miles is lake navigation, where Oneida, Onondaga and Cross Lakes are utilized. Forty-three per cent. of the entire mileage will have a minimum bottom width of 75 feet and the remainder not in lakes will be in canalized rivers and streams with a bottom width of channel ranging from 110 to 200 feet. On November 30 1909, there had been excavated 25,000,000 cubic yards of all classes of material, and 2,500,000 cubic yards of embankment had been formed. At that time there had been laid 500,000 yards of concrete and 5,000,000 feet of sawed lumber had been used. The total value of work since the beginning of construction amounted to \$15,800,000 and the estimates for 1910 were stated at \$16,000,000. At the rate of progress in 1909 it was estimated that the entire barge canal system would be completed at the end of the year 1914.

An interesting project discussed in 1909 and advancing towards accomplishment was the proposed ship canal at Seattle, Washington, to connect Lake Washington with Puget Sound, enabling the largest vessels to be transferred to this fresh water lake, where they may be tied up at wharves uninfluenced by tides and more accessible to a large portion of the city, which is at a higher level than the piers on the Sound, not to mention affording a much needed increase in harbor facilities. The right of way has been acquired, the project has been approved by the United States War Department, and appropriations were made by the State and action taken by the county towards carrying on the work, which will be done jointly with the United States Government. The estimated cost was \$250,000 for right of way already acquired, \$1,000,000 for excavation, \$1,250,000 for bridges and other crossings, while the locks, controlling works and power plant to be built by the government were estimated to cost \$2,500,000. The right of way is 300 feet in width and there will be a single lockage, though two locks, one 800 feet long, 80 feet wide and 36 feet deep, and the other 150 feet by 30 feet, by 16 feet, for small craft, will be constructed. This will raise vessels to the level of Lake Union, a small body of fresh water entirely within the city limits. The level of Lake Washington will be lowered without injury, it is thought, to its appearance, and much swamp land will be drained. The locks are to be built of reinforced concrete and steel, founded on a hard, tenacious blue clay. The excavation is along a route only about four miles in length and only three or four years' time were estimated as necessary for the completion of the work, once it was put under way.

An accident occurred at the lock of the Canadian Canal at Sault Ste. Marie, which occasioned much comment, particularly in view of the adoption of the lock type of canal at Panama. A vessel bound up, through a confusion of signals, struck the lower gates of the lock and caused them to release the water in the lock and to draw out the upper gates, allowing a flood of water to pass unrestrained through the lock. A second vessel was in the lock bound down, and a third was entering the lock in the same direction. One of these vessels was somewhat damaged as a result of a collision with a ship below, but the injuries to the other steamships involved were not serious. Within about 12 hours after the accident a movable dam, provided for just such occasions, was placed across the canal, thus controlling the outflow of water, and four days after the accident the lock gates were closed in readiness for repairs, which were completed within less than two weeks. This is the first serious accident of the kind that has occurred at either of the canals at the Sault Ste. Marie in 54 years. It was considered that it demonstrated the groundlessness of any fear on this score at Panama, as with suitable precautions such an accident should never occur, and if it did occur it was not of so serious a character as to render the lock incapable of use after a rapid repair by devices provided readily for that purpose. In November a collision occurred in the American canal, a vessel striking the upper lock gate and damaging it. The injury was not particularly serious and a new gate was promptly set in place.

During 1909 the work of widening the American canal at St. Mary's Falls (Sault Ste. Marie), was continued and the work was nearing completion. The plan was to widen the canal from 108 feet to 230 feet so as to permit the passage of vessels in both directions, leaving an island for the pivot piers of the railway drawbridge, and the bridge which carries the movable or emergency dam, a device so successfully used in the accident on the Canadian canal. The work was carried on without interference with traffic by leaving a small strip between the new and old canals, to be removed by blasting after the close of navigation. The enlarged channel, it was expected, would be ready for use in 1910. During 1909 progress was also made with the new lock and separate canal, which was provided in the River and Harbor act of March 2, 1907, at an estimated cost of \$6,200,000. Work in 1909 consisted in the construction of the cofferdam around the lock-pit and considerable excavation on the site of the lock.

The city of Buffalo had on foot a project for the construction of a drainage canal in order to divert its sewage from the Niagara River and empty it into Lake Ontario. This enterprise involved the withdrawal of 6000 cubic feet of water per second from Lake Erie and the reversal of the flow in Buffalo River and Smoker Creek, in addition to the construction of a new canal at an estimated cost of \$36,000,000 to Lake Ontario. In this undertaking power estimated at 150,000 horse-power will be developed, but this is secondary to the purification of the Niagara River and the diversion to the drainage canal of all sewage from towns along its banks, who derive from it their water supply. The plan involved both excavation and tun-

neling and a connection by lock with the New York State Barge Canal providing a terminal at Buffalo as well as at Tonawanda.

In Germany the use of the Kaiser Wilhelm Canal from the Elbe to the North Sea increased and preparations were being made for its enlargement. It was announced that the waterway was to be deepened to 36 feet at first and if necessary to 46 feet at some later period. The width of the canal was to be doubled and new locks constructed 1082 feet long, 147 feet wide, and with 46 feet of water over the sills. The entire improvement was estimated to cost about \$33,000,000. Early in the year work was commenced in the Berlin-Stettin ship canal, which is to be 26 feet deep and 100 feet wide. This work, for which \$12,500,000 have been appropriated, will require eleven locks, each with a drop of 9 feet, and 37 bridges.

The inland waterways of France are formed in large part by rivers which have been canalized and otherwise improved. During the year recommendations were made for the improvement of the Seine, Marne, Escaut, and Sambre and the Aire Canal, which it was estimated would involve over \$15,000,000. Regulation of the channel of the Rhine at its widest place was also contemplated. See PANAMA CANAL.

CANARY ISLANDS. A group of islands off the northwestern coast of Africa, constituting a province of Spain. Area, 2808 square miles. Estimated population, December 31, 1908, 403,908. The seat of government is Santa Cruz, and the most important town Las Palmas. The leading products and exports include potatoes, bananas, onions, tomatoes, and nuts. A submarine cable from Emden to Teneriffe was being laid in 1909; the cable is projected to Pernambuco, probably *via* Monrovia (Liberia). It had been a grievance to the people of Las Palmas, the largest city of the Canaries, that they were not under a direct representative of the Spanish government, but were ruled from Santa Cruz in Teneriffe, where the Governor had his seat. In 1909 the Spanish government, having decided to increase the rank and dignity of the office of Governor, Las Palmas protested against this system, and it was decided that the Governor should remain alternately for six months at Santa Cruz and Las Palmas, leaving a deputy-governor at the latter capital in his absence. This proposal was received with rejoicing at Las Palmas, but with corresponding chagrin at Santa Cruz. To solve the question it was proposed to refer it to a committee consisting of representatives of the islands. The new Governor, Señor Eulate, left Madrid on November 25 to assume office.

A serious volcanic eruption occurred on the island of Teneriffe from November 1 to November 20.

CANCER. While the relation between chronic traumatism and external cancer has long been recognized, the dependence of cancer of the internal organs upon chronic irritation has not been considered proven. Haberfeld, however, utilizing the enormous material of Vienna, has been able to examine a sufficient number of cases of cancer of the stomach, gall tracts and lungs to prove, in his opinion, that at least in these three organs chronic trauma is a most important predisposing cause of cancer. Of the 662 cases of cancer of the stomach occurring in Haberfeld's series of 20,000 autopsies, 106, or 16 per cent. showed evidence of having

originated in round ulcer of the stomach. Carcinoma and ulcer correspond very strikingly as to their distribution in different parts of the stomach. The autopsies confuted the current opinion that carcinoma is more common in men and ulcer in women, there being but little difference between the two sexes with respect to these lesions.

Even more striking is the relationship between the concurrence of gallstones and carcinoma of the gall tracts. In the 20,000 autopsies there were 164 cases in which carcinoma of the biliary tract caused death, and in 119 of these (73 per cent.) gallstones were present. Here also collateral evidence is available, consisting in the fact that there is the same predominance of cancer of the gall tracts in women, viz.: 73 per cent. of all cases, as there is of gallstones, in the same series of autopsies, which yielded 265 cases of cholelithiasis, of which 195, or 73 per cent., were in women. The question as to whether the gallstones were due to cancer, rather than the predisposing cause, seems to be settled in the negative by Seigert's observation that, whereas in a series of 99 cases of primary carcinoma of the gall bladder, stones were present in 95, in 13 cases in which gall-bladder cancer was secondary to a growth in some other organ, stones were found only twice.

In cases of carcinoma of the lungs, chronic irritation was found to play a similar rôle, though evidence was more difficult to collect and interpret. Haberfeld found 68 cases of primary lung cancer in a series of 40,000 autopsies. As evidence that lung tumors may be incited by chronic trauma, we have the following facts: These tumors predominate in the right lung, and chiefly in the main bronchus, which may be correlated with the fact that the right bronchus is most subject to injury by dust and other foreign materials, owing to its more direct continuation from the trachea and to its larger size. Cancer of the lung is more common in men than in women, in the proportion of about three to one, which harmonizes with the fact that men are more exposed to bronchial irritation by reason of their occupations and habits. Histologically, it is found that pulmonary cancer is frequently a squamous-cell carcinoma, which is explained by the fact that under the influence of chronic irritation the cylindrical epithelium of the bronchi becomes transformed into the protective, squamous-cell type of epithelium, from which, in turn, squamous-cell carcinoma may develop under continued irritation.

A symposium of cancer problems, particularly those concerning the power of the animal organism to protect itself and develop immunity against malignant growths, was held at the last meeting of the German Pathological Society in Kiel, and the latest views concerning immunity and the spontaneous healing of cancer were discussed. Sticker emphasizes the widespread existence of a natural immunity to tumors, which is shown by the following observations: Tumors arising spontaneously in animals cannot be transplanted into animals of any other species, and only a few tumors can be transplanted even into animals of the same species. Metchnikoff was unable to transplant human tumors into anthropoid apes, while Sticker made over 400 unsuccessful attempts to transplant human tumors into various domestic

and laboratory animals. Artificial immunity against the transplantable tumors of animals has been secured by various means. An animal recovering spontaneously from an inoculated tumor will be found immune to subsequent inoculations, and its blood will in some cases protect other animals, if injected before or soon after they are inoculated. Animals have also been rendered actively immune to tumors by previous injection of tumor cells directly into the veins, by which route no tumors are ever produced; while, in the case of transplantable mouse cancer, immunity has been secured by injection of mouse embryos, mouse liver and benign mouse tumors, and even by injection of normal mouse blood. Attempts to secure active immunity by the injection of cells killed in various ways have been as a rule unsuccessful.

Ehrlich's form of immunity known as *athreptic* was warmly discussed by the German pathologists. The main facts of this subject are briefly as follows: When a tumor is implanted into an animal in several places at one time, several or all of the inoculations will take, but if a single tumor has been inoculated and has begun to grow vigorously, a second inoculation will seldom take. If an implantation tumor is extirpated, however, the animal becomes susceptible to a new inoculation even if made on the same day as the resection is done, but if the growing tumor is only partially removed it is still impossible to cause new implantation tumors. In mouse tumors it makes no difference whether or not the tumors used for first and second implantation are the same, for the presence of the rapidly-growing carcinoma will prevent successful inoculation with a sarcoma and vice versa, but Sticker found that a spindle-cell sarcoma growth in a dog did not prevent successful inoculation with a round-cell sarcoma. Ehrlich's explanation of this phenomenon is that the first rapidly growing tumor attracts the necessary nutritive substances to itself so strongly that the cells which are implanted later, being at first very poorly nourished, are unable to secure enough food and either perish or multiply very slowly; consequently this form of immunity is best seen when the first tumor is growing rapidly, and slowly-growing tumors may merely cause the second implantation to grow somewhat more slowly than a primary.

Ross and Macalister record a remarkable relation between the action of the body-fluids of persons suffering from cancer and a mixture of methylene blue and atropin. They noted that there appears to exist in the body-fluids of carcinoma subjects a substance which causes the excitation of an ameboid movement in the leucocytes. A mixture of methylene blue and atropin excited these movements; so did the blood of a cancer patient. The same mixture caused lymphocytes to extrude flagella with a particle of chromatin at their ends. The plasma of a cancer subject did the same. These authors found also that an extrusion of chromatin appears to be a phenomenon which occurs in cancer cells, and that cancer cells appear to produce "something" which aggravates the disease. It is possible, they say, that this "something" is chromatin, and in support of this theory is the fact that an extract which probably contains chromatin or a derivative of it accelerates the action of the artificial excitant. It may be noted that chromatin is a product of katabolism which may cause predisposition to the disease in persons over the age of 40.

CANFIELD, JAMES HULME. An American educator and librarian, died March 29, 1909. He was born in Delaware, Ohio, in 1847, and graduated from Williams College in 1868. After several years of railroad building, combined with the study of law, he was admitted to the bar in 1872. He practiced in Michigan until 1877, when he became professor of history in the State University of Kansas, holding this position until 1891, when he was chosen Chancellor of the University of Nebraska. In 1895 he became president of Ohio State University, and in 1899 he resigned this office to become librarian of Columbia University. He was the author of *Taxation* (1883); *A History of Kansas* (1889); *Local Government in Kansas* (1889); *The College Student and His Problems* (1902). Dr. Canfield was for five years secretary, and for one year president, of the National Educational Association.

CANNING OF FRUIT. See HORTICULTURE.

CANNON, JOSEPH GURNEY. An American public official, Speaker of the House of Representatives. He was born in Guilford, N. C., in 1836, and after receiving education in the public schools was admitted to the Illinois bar. From 1861 to 1868 he was State's Attorney of Illinois. In 1873 he was elected a member of Congress and served until 1891. In 1892 he was defeated for re-election but was re-elected again in 1893 and served continuously thereafter. He served as Speaker in the 58th, 59th, 60th, and 61st Congresses. In the beginning of the 60th Congress considerable opposition developed to the methods of procedure in the carrying on of the business of the House adopted by Speaker Cannon, and this opposition increased in force during the 60th and 61st Congresses. There developed in the House of Representatives a body known as "insurgents," composed chiefly of Republican Representatives of Western States, although including several members of Congress from the East and other sections of the country. These "insurgents" declared that Speaker Cannon's rule was autocratic and was devoted in the main to obstructing the passage of measures advocated by the more "progressive" element in the House of Representatives, especially certain measures proposed and advocated by President Roosevelt. This opposition, however, did not attain proportions sufficient to lessen the Speaker's power until the beginning of the special session called to oppose the tariff bill. At this time the "insurgent" Republican Representatives aided by the Democratic Representatives secured some slight amendments to the rules under which the proceedings of the House of Representatives are conducted. (See UNITED STATES, paragraph on Congress.) Speaker Cannon's attitude during the discussion of the tariff bill in the House was characterized by the insurgents, and by those outside the House of Representatives who favored a radical downward revision, as hostile to such a revision, in spite of the fact, as they alleged, that such a revision had been promised by the Republican platform. After the passage of the bill Speaker Cannon and Senator Aldrich (q. v.) received the chief brunt of hostile criticism. A regular campaign was carried on against the former by various influential magazines in the country, and the movement progressed so far that many Representatives in various parts of the country were charged by their constituents to vote against Cannon's re-elec-

tion to the Speakership. In reply to these attacks Speaker Cannon defended himself in several speeches, and especially in an address delivered in the latter part of October at Elgin, Ill. At this time he spoke with great bitterness of the attitude of the insurgent Republicans and declared that if they were Republicans he, himself, was something else. Following this address the attacks upon him by the supporters of the radical policies were even more bitter than before. See UNITED STATES, sections *Congress* and *Administration*.

CAPE COD CANAL. See CANALS.

CAPE COLONY. A British possession in South Africa. The capital is Cape Town.

AREA AND POPULATION. The area in square miles, and population of the colony and its dependencies, according to the census of April 17, 1904, are stated as follows:

	Area	White Pop.	Total Pop.
Colony proper	206,860	553,452	1,489,691
East Griqualand	7,594	5,901	222,685
Tembuland	4,117	8,056	231,472
Transkei	2,552	1,707	177,730
Walfish Bay	430	144	997
Pondoland	3,918	1,113	202,757
Bechuanaland.....	51,524	9,368	84,472
Total	276,995	579,741	2,409,804

The estimated population on December 31, 1907, was 2,507,500 (610,680 whites). In 1907 there were 60,415 births, 35,491 deaths; in 1908, 60,524 and 33,967 respectively. The larger towns, with population in 1904, were: Cape Town, the capital, 77,668 (with suburbs, 169,641); Kimberley, 34,331; Port Elizabeth, 32,959; Graham's Town, 13,877; Woodstock, Wynberg, and Claremont (included in the Cape Town "suburbs"), 28,990, 18,477, and 14,972 respectively. In 1904 1,305,453 persons were returned as Protestants. Education is not compulsory. Of the white population in 1904 about 22 per cent. of the males and 24 per cent. of the females could neither read nor write. On June 30, 1909, there were open 3681 schools with 172,225 pupils. There are also 5 colleges, with about 850 students, and an examining and degree-conferring university.

INDUSTRIES. Agriculture, mining, and the rearing of the live-stock are the principal industries. Of the total area of Cape Colony, 42,210,382 acres had not been alienated up to the end of 1908. The important crops are cereals, especially corn, oats, and wheat. The estimated value of cereal production in 1907 was \$7,213,939; of vineyard production, \$1,313,342; of fruits, \$378,127. The number of live-stock in 1904 was as follows: Cattle, 1,934,390; horses and mules, 419,963; sheep, 11,818,829; goats, 7,162,463; swine, 385,945; ostriches, 357,970. Wool, Angora hair, and ostrich feathers are important products and exports. The estimated value of live-stock in 1907 was \$127,804,000. Of mining products the most important is diamonds, of which the famous Kimberley district produced a value of £2,685,150 in 1908. There are valuable copper mines in Namaqualand, the ores yielding a percentage of from 32 to 36. Gold is found in the Knysna division, and manganese in the Paarl. The coal output in 1908 amounted to 122,685 tons. In 1904 there were 2527 industrial establishments, including flour

mills, breweries, tobacco factories, tanneries, saw mills, coach-building works, etc., employing 30,318 persons and having plant and machinery valued at £2,180,336, and annual output £9,040,579.

COMMERCE. Imports and exports, exclusive of specie, are stated as follows for fiscal years:

	1906	1907	1908
Imports.....	£18,102,872	£15,586,792	£13,739,878
Exports.....	40,048,693	44,504,450	42,011,582

The imports in 1908 included: Manufactured articles, £9,381,987; foods and beverages, £3,952,861; raw material for manufacture, £1,830,725; agricultural implements, etc., £246,251; live-stock, £141,585. The principal exports in 1908 were: Gold (chiefly from the Transvaal, though not included in the imports), £30,992,137; and diamonds, £4,796,655. The principal exports in 1907 were: Gold, £28,226,185; diamonds, £8,973,148; wool, £2,490,297; ostrich feathers, £1,814,210; Angora hair, £914,597; hides and skins, £804,027; copper ore, £577,395. In 1907 imports from and exports to Great Britain were valued at £9,674,650 and £43,017,180 respectively; British possessions, £4,022,344 and £37,546 respectively; other countries, £3,943,117 and £1,360,681.

COMMUNICATIONS. The length of railways in operation on December 31, 1908, was 3641 miles, of which 3265 miles were owned and operated by the government and 376 miles by private companies. Up to that date the capital expended by the government on railways was £32,155,156. By the Cape to Cairo Railway, Cape Town has steam communication with Bulawayo, the commercial centre, and Salisbury, the capital, of Rhodesia, and with Beira (Portuguese East Africa), the Victoria Falls, and Broken Hill. In 1908 there were 1065 post-offices; 586 telegraph offices, with 31,836 miles of wire; and 5751 miles of telephone wire. Cape Colony has cable connection with Europe via the West Coast, via St. Helena, and overland, and with Australia via Natal. The foreign shipping in 1907 included 648 vessels of 1,986,050 tons entered and 678 of 2,111,304 tons cleared, both entrances and clearances being mostly British.

FINANCE. Revenue and expenditure for fiscal year ended June 30 have been as follows:

	1906	1907	1908
Revenue.....	£8,236,880	£7,701,191	£6,981,873
Expenditure..	8,231,719	8,349,316	7,973,727

For the fiscal year 1909 the estimated revenue, exclusive of revenue from additional taxation, was £7,278,820, and the estimated expenditure, £8,192,291. The principal items of revenue in the fiscal year 1907 were: Railways, £3,662,533; customs, £1,763,400; stamps, £450,203; posts, £351,338. The larger expenditures were: Railways, £2,789,585; public debt, £1,743,463; justice and police, £866,297; public instruction, £507,177; posts, £347,746; administration, £332,227. The public debt on December 31, 1908, stood at £48,424,502, incurred principally for railways and other productive works; in addition there were treasury bills of £4,721,378; total, £53,145,880.

GOVERNMENT. The executive authority is vested in a governor and executive council, ap-

pointed by the Crown. There is a responsible ministry of six members. The legislative power devolves upon a parliament of two houses, the Legislative Council (26 members, elected directly for seven years) and the House of Assembly (127 members, elected directly for five years). The Governor (and Commander-in-Chief) of Cape Colony in 1909 was Sir Walter Francis Hely-Hutchinson. The Premier and Treasurer in 1909 (since February 22, 1904) was John X. Merriman.

HISTORY. The chief interest of the year centered in the adoption of the South Africa constitution (see *SOUTH AFRICA, BRITISH*). Parliament opened on June 1. In his speech the Governor, Sir W. F. Hely-Hutchinson, announced an improved condition of the finances, although equilibrium was not yet reached, and declared that no new taxation would be necessary. He referred to the renewed agricultural prosperity. Among the measures to be introduced by the government was a bill for labor colonies for the poor whites. On June 3, the bill accepting the Union passed the Cape Parliament, with only two members dissenting—Mr. Schreiner and Sir Gordon Sprigg. On June 5, Premier Merriman announced the adoption of the Act of Union and declared that the government would submit a bill to Parliament for the appointment of delegates to Great Britain, himself among them, to present the Draft of the Union, the delegation to have the power to accept amendments thereto. For an account of Mr. Schreiner's mission to England on behalf of the colored population see the article *SOUTH AFRICA, BRITISH*. A considerable party among the colored people appeared to be opposed to Mr. Schreiner's plan, for although they objected to the clause of the Draft of Union which drew the color line in the matter of representation, they disapproved any appeal to a government outside South Africa. On October 5, Premier Merriman introduced the budget with a speech in which he announced the deficit for the present year to be £364,000 and estimated the deficit for the next year at £82,000, but he said that according to the returns for the first three months of the present year the prospects were very favorable and that a surplus would result if taxes were kept at the same level as last year. He referred to the great increase of Cape Colony's exports to other parts of South Africa, to the revival of the diamond market and to the increase of the native labor supply from Cape Colony to Johannesburg. He proposed the reduction by one-half of the duties on brandies of the higher grades and lower railway rates on wines as compared with those charged on beer, and the imposition of a stamp duty of a halfpenny on cigarettes; also readjustments of educational finance and the incidence of the income tax. The budget though well received generally was sharply criticised by the wine-growing representatives, who declared that the measures proposed for the relief of their industry were inadequate. The government agreed to some concessions, and a light wine license bill was later introduced. In a speech on October 22, the Premier warned the Council against taking too optimistic a view of the financial situation and against making demands for excessive expenditure. The light wine bill passed the Assembly, but the Opposition strongly objected to it and pursued obstructive tactics in order to prolong the ses-

sion and embarrass the government. In consequence of these harassing tactics of the Opposition and of the desertion of some of its own supporters the government decided to place the granting of the light wine licenses in the hands of the town governments. There was much criticism of its course in having yielded to the demands of the wine growers in the first instance. The bill passed its third reading November 19. Many of the government measures were held up, but work went on more rapidly toward the end. The last regular session of the Cape Parliament ended on December 3.

CAPE TO CAIRO RAILWAY. Of important political and engineering significance was the construction of the various links in the Cape to Cairo Railway system, which by progressive advances was gradually linking together the countries of Africa. In the north the line through Egypt had been extended south to Khartum and by 1909 it had progressed thence 70 miles up the Blue Nile and then to the White Nile, which was to be crossed by a bridge under erection in that year. To the south the scheme involved the extension of the Rhodesian Railway from Broken Hill, the terminus it had reached in 1908. This line was owned by the British South Africa Co., and extends from Vryburg to Bulawayo, and thence to the Victoria Falls where the Zambezi River is crossed by a notable steel arch bridge opened in 1905. Thence the line was extended north to Broken Hill mine, 374 miles above the falls. In 1908 the British South Africa Co., the Katanga Railway Co., the Union Minière du Haut-Katanga and the Lower Congo-Catanga Railway Co., reached an agreement whereby the Rhodesian Railway was to be extended to the frontier of the Congo State, a distance of 133 miles. This was reached on November 16, 1909, and is 2147 miles from Cape Town. Thence the various Congo lines would construct extensions as the copper mining industry and other commerce warranted. The distance between the two systems was only about 300 miles, and this gap was under construction in 1909, the contract having been let for £3200 a kilometre. During the year the first section, from Stanleyville to Ponthierville, of the line to the Great Lakes and a large portion of the second section, or from Kindu to Kuyolo, had been surveyed and laid out.

CAPE VERDE ISLANDS. A group of 14 islands in the Atlantic about 350 miles west of Cape Verde, constituting a Portuguese colony administered by a governor at Praia. Area, 1457 square miles; population (census of December 31, 1900), 147,424, of whom 3856 were whites, 24,639 colored, and 48,929 negroes. Cultivated products include coffee, sugar, millet, indigo, and tobacco. Imports and exports in 1906 were valued at 2,092,540 milreis and 392,479 milreis respectively; in 1907, 2,339,684 and 220,261 respectively (the milreis is worth \$1.08). Exclusive of coasting trade, the shipping in 1907 amounted to 2118 vessels of 5,905,986 tons. For the year 1908-9 the estimated revenue and expenditure balanced at 465,182 milreis.

CAREY, ROSA NOUCHETTE. An English novelist, died July 19, 1909. She was born in London and was educated at the Ladies Institute, St. John's Wood. Her first novel, *Nellie's Memories*, was published in 1868, and it was followed by a novel nearly every year until

1907. Though lacking any remarkable literary qualities, her writings are wholesome and readable. Among the best known books are *Wee Wifie* (1869); *Queenie's Whim* (1881); *Not Like Other Girls* (1884); *Uncle Max* (1887); *Rue with a Difference* (1900); *Household of Peter* (1905). Her last novel, *The Angel of Forgiveness*, was published in 1907.

CARLOS DE BOURBON, DUKE OF MADRID. Pretender to the Spanish throne, died July 18, 1909. He was born at Laibach, Austria, March 30, 1848, the eldest son of Don Juan de Bourbon, the third in the line of Spanish Pretenders, and of Marie Beatrice, Archduchess of Austria, and Princess of Modena. He was christened Don Maria de los Dolores Juan Isidoro Josef Francesco Quirino Antonio Miguel Gabriel Rafael Carlos, but he was known for the greater part of his life simply as "Don Carlos." His rights to the Spanish throne, which his father "abdicated" in his favor in 1868, were based on the ground that Isabella, daughter of Ferdinand, who was Carlos's granddaughter, and Christina, mother of Alfonso XII., were, by the Salic law, debarred from the succession. Carlos was the senior male representative of the house of Bourbon, and as such was first in direct succession to the throne of France, in the event of the restoration of the monarchy. He never asserted this claim, however, as by the treaty of Utrecht it was forbidden that the thrones of France and Spain should be occupied by the same person, and by the assertion of his right to the French succession, Carlos would have been obliged to renounce his claim to the throne of Spain. Carlos was educated in Austria, and Margaret de Bourbon, Princess of Parma, was chosen as his wife. In 1869, when he had reached his majority, he attempted, by the help of a portion of the Spanish clergy favorable to his claims, to profit by conditions existing in Spain to rouse on his behalf the supporters of his family's claims. The first sporadic outbreak in his behalf was easily crushed by the reigning family. Carlos made France the base of his plotting until, on complaint of Spain, Napoleon III. forced him to remove to Swiss territory. In April, 1872, he succeeded in raising an army in the northern provinces of Spain, and in July, 1873, he took active command himself. He had himself crowned as Charles VIII. and, until 1876, virtually reigned over northern Spain. After bitter fighting for nearly four years the forces of Carlos were decisively defeated by the army of Alfonso XII. at Estrella, in February, 1876. Carlos escaped into France, and made no further attempts to establish his pretensions by force of arms. In 1881 he was expelled from France for supporting the claim of the Comte de Chambord to the Bourbon throne of France. The ban was later removed, but he never again lived in France.

In 1893, following the death of his first wife, Carlos married Princess Marie-Berthe de Rohan. He gave out an "interview" in 1897 in which he declared that his failure to reassert his rights was his fear of embarrassing the Spanish government in its struggle to put down the Cuban insurrection. It was generally understood, however, that the real reason for his inactivity was the displeasure of his most powerful Spanish supporters at the fact that he had married a woman not of royal rank, who would never have been acknowledged as Queen of

Spain. Carlos's second marriage brought him great wealth, and that was considered to be his motive in making it. His tastes were very extravagant, and although his first wife left a great fortune, he was unable to use more than its income.

Carlos of late years made his home in Venice, where he was a well-known figure. He was a striking man of splendid physique and noble mien. In 1896, his second daughter, Elvira, eloped with a painter, a married man, and Carlos issued a proclamation disowning her. His son, and his successor as Pretender, is Don Jaime de Bourbon, who is about 40 years of age and an officer in the Russian Guards.

CARNEGIE FOUNDATION. See UNIVERSITIES and COLLEGES.

CARNEGIE INSTITUTION OF WASHINGTON. An institution founded in 1902 by Andrew Carnegie when he gave to a board of trustees \$10,000,000, yielding 5 per cent. annual interest. To this endowment Mr. Carnegie in 1907 added \$2,000,000. The institution was incorporated by Act of Congress approved April 28, 1904. The articles of incorporation declare in general, "that the objects of the corporation shall be to encourage in the broadest and most liberal manner investigation, research and discovery, and the application of knowledge to the improvement of mankind." The institution has carried on many projects in widely different fields of inquiry. These projects consist chiefly of three classes: First, large projects or departments of work whose execution requires continuous research by a corps of investigators during a series of years. Ten such departments have been established by the Institution. They include the following: Department of Botanical Research; Department of Economics and Sociology; Department of Experimental Evolution; Geophysical Laboratory; Department of Historical Research; Department of Marine Biology; Department of Meridian Astrometry; Solar Observatory; Department of Terrestrial Magnetism; and Nutrition Laboratory. Many grants in aid of this class of projects have been made. The third class includes research associates and assistants. Under this head aid has been given to a considerable number of investigators possessing exceptional abilities and opportunities for research work. The Institution lost heavily during the year by death. Four Trustees, Carroll D. Wright, William Wirt Howe, Ethan Allen Hitchcock, and William Lindsay, together with Professor Simon Newcomb, the Research Associate, died during the year. Investigation was carried on during 1909 under the auspices of the Institution in more than 30 different fields of research and these investigations extended to more than 40 countries. The total number of volumes or publications issued directly by the Institution is 141, with an aggregate of about 35,000 pages of printed matter. For the larger departments of investigation there are now provided two astronomical observatories, five laboratories and one ship. A complete list of the equipment of these establishments includes 58 buildings and 8 smaller craft, in addition to the ship *Carnegie*. The total amount of funds appropriated for expenditure up to June, 1909, was \$4,320,140. The officers in 1909 were: President Robert S. Woodward; John S. Billings, chairman of Board of Trustees; Elihu Root, vice-chairman; Cleveland H. Dodge, secre-

tary. The Executive Committee includes William H. Welch, chairman; John S. Billings, Cleveland H. Dodge, S. Weir Mitchell, William B. Parsons, Elihu Root, Charles D. Walcott, and Robert S. Woodward.

CAROLINE ISLANDS. A group of islands north of New Guinea constituting a German possession (since 1899) and attached administratively to German New Guinea. Area, including the Pelew Islands, about 560 square miles; population, about 41,400, of whom in 1907, 137 were whites. For administrative purposes the islands are divided into East Carolines, with Ponapé as seat of government, and West Carolines (including the Pelew Islands and the Ladrone Islands), with Yap as the seat of government. In 1907 imports to East and West Carolines and to the Pelew and Marianne Islands amounted to 819,527 marks; exports, chiefly copra, 366,492 marks. For the year 1909-10 the estimated expenditures (including the Marshall Islands) is 609,458 marks.

CARPENTER, GEORGE RICE. An American educator, died April 8, 1909. He was born on the coast of Labrador in 1863, and graduated from Harvard University in 1886. He studied in Berlin and Paris from 1886 to 1888, and from the latter year to 1890 was instructor in English at Harvard. In 1890 he became associate professor of English at the Massachusetts Institute of Technology, holding that position until 1893. He became in the autumn of the latter year professor of rhetoric in Columbia University. Professor Carpenter's work in this capacity was notably successful. He was an inspiring teacher, an admirable organizer, and a man of high scholarly attainments. He was the author of a number of text-books in rhetoric and grammar, and wrote, besides, several volumes of a more general and literary nature. Among these were: *Life of Longfellow* (1901); *Life of Whittier* (American Men of Letters Series) (1903); and *Walt Whitman* (English Men of Letters Series) (1909).

CARSON, PERRY. An American negro politician, who was at one time the leader of negro politics in Washington, died November 1, 1909. He was born in Maryland and at the age of 15 was employed by politicians to assist fugitive slaves. He was once arrested for this work, but was released. President Lincoln heard of him and provided civil employment for him with the army in the Civil War until Carson enlisted as a volunteer. He was aggressive in many campaigns and was for many years delegate to national conventions in the District of Columbia. His latest appearance as a delegate was in the national convention of 1892 at Minneapolis, when he voted for James G. Blaine.

CASEMENT, J. S. An American soldier and engineer, died December 13, 1909. He was born in 1829 at Geneva, N. Y., and early won a reputation as an engineer. Previous to the Civil War he had laid the first rails of the Lake Shore Railroad from Cleveland to Erie, Pa., and of the Big Four from Cleveland to Columbus. He served in the Civil War, rising to the rank of brigadier-general. He did efficient service during the war in building bridges as fast as the Confederates destroyed them on Sherman's march to the sea. After the war he built a part of the Union Pacific Railroad, setting up a record of seven miles a day, which was never

surpassed. He also built the Nickel Plate Railroad from Cleveland to Buffalo, and later built railroads in Central America.

CATALYSIS, NEGATIVE. See CHEMISTRY.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning under the auspices of the Roman Catholic Church, founded at Washington, D. C., in 1885. There are faculties of philosophy, letters, sacred science, law and science. An undergraduate department was opened in 1902. Connected with the University are the following non-affiliated undergraduate colleges, Marist, Juniorate, and the College of St. John Canty. There were in 1909 258 students and members of the faculty. The books in the library numbered about 55,000. In January, 1909, Rev. James J. Shahan was selected to succeed Bishop Dennis J. O'Connell as rector of the University. Among other changes in the faculty during the year were the appointments of Very Rev. Charles F. Aiken, D. D., as Dean of the faculty of theology; Rev. N. Weber, D. D., instructor in history; Rev. J. M. Cooper, D. D., instructor in religion, and Dr. Frank O'Hara, Ph. D., instructor in economics. There were received in gifts during the year, \$34,846.

CATSKILL DAM. See DAMS.

CATTLE. See STOCK RAISING.

CALVALRY. See MILITARY PROGRESS.

CAYMAN ISLANDS. British West Indian possessions, administratively attached to Jamaica. Area, 225 square miles. Population, about 6000, the majority being whites. The principal town is Georgetown in Grand Cayman. Cocoanuts and turtle shell are exported. Imports and exports were valued at £28,000 and £16,000 respectively in 1906-7. The dependency is administered by a commissioner, who was George S. S. Hirst in 1909.

CELLITE. See CHEMISTRY, INDUSTRIAL.

CEMENT. The total quantity of Portland, natural and puzzolan cements produced in the United States in 1908 was 52,910,925 barrels, valued at \$44,477,653, as compared with 52,230,342 barrels, valued at \$55,903,851 in 1907. The small increase in quantity and the heavy decrease in value indicated the serious trade conditions which the cement industry encountered in 1908. Of the total production Portland cement comprised 51,072,612 barrels, natural cement, 1,686,682 barrels and puzzolan, 151,451 barrels. All the older States producing cement, especially in the eastern part of the country, showed heavy decreases in output, while a relatively small number of plants, mostly in the Middle West, reported very large increases as against 1907. The only really large producer to report an increase was the United States Steel Corporation. Pennsylvania ranks first among the States in the production of cement, followed by Indiana, Kansas, Illinois, New Jersey, Michigan, Missouri and New York. There were in 1908, 96 Portland cement plants in operation as compared with 94 in 1907. The industry has shown a remarkable growth since 1870, when only 82,000 barrels were produced. The production has steadily increased since that time. The total production from 1870 to 1908 inclusive was 395,567,392 barrels. The average price per barrel fell from \$1.11 in 1907 to 85 cents in 1908. Of the Portland cement manufactured, 40.6 per cent. is made of cement rock

and pure limestone, 45 per cent. from limestone and clay or shale, 5.5 per cent. from marl and clay, and 8.9 per cent. from slag and limestone.

New York is first among the States in the production of natural cement, followed by Pennsylvania, Indiana and Illinois. The imports of cement in 1908 amounted to 842,121 barrels, while the exports of hydraulic cement amounted to 846,528 barrels. The apparent consumption of Portland cement in 1908 was 51,068,505 barrels.

CENSUS. See UNITED STATES.

CENTENARIES AND ANNIVERSARIES.

The year 1909 was the anniversary of the births of an unusual number of eminent persons and of memorable events both in the United States and in foreign countries. The two events most elaborately celebrated in the United States were the tercentennial of the discovery of Lake Champlain and the Hudson-Fulton celebration in New York City and in other cities along the Hudson River. These events are discussed in separate paragraphs below.

In the early part of January the centenary of the birth of Edgar Allan Poe was celebrated quite generally throughout the United States. There were special exercises in Baltimore, where Poe was born and died; at Brown University, Providence, R. I., and New York City. In the latter place, a bust and tablet were unveiled in Poe Park opposite Poe College at Fordham. The centenary of the birth of Abraham Lincoln was widely celebrated on February 12. The most notable event in the anniversary was the dedication of Lincoln Farm at Hodgenville, Ky. This farm, which was the birthplace of Lincoln, was purchased by a national association formed for that purpose. The cornerstone of a memorial building was laid by President Roosevelt who made a notable address. Addresses were also made by General Luke E. Wright, at that time Secretary of War, on behalf of the Confederate soldiers; by James Grant Wilson, of New York, by Governor Willson of Kentucky and others. Among other notable celebrations in commemoration of the birth of President Lincoln were those held in Springfield, Ill., in New York City, and Chicago. The same date, February 12, was also the anniversary of the birth of Charles Darwin and this occasion, although perhaps of more interest to the scholar than to the layman, was observed in several cities of the United States, and the event was also celebrated in England and in other countries of Europe. (See DARWIN MEMORIAL.) On February 3 occurred the centenary of the birth of Mendelssohn, and on March 1 the anniversary of the 100th year since the death of Chopin. These anniversaries were celebrated more widely abroad than in the United States. On May 31 a group of writers and artists, who have their home in Westchester county, N. Y., commemorated some of the notable events in the history of that county at Bronxville, N. Y. The pageants included many beautiful and inspiring scenes. On July 5, the town of Norwich, Conn., celebrated the 250th anniversary of its settlement. President Taft was the guest of honor. There were many impressive pageants setting forth the important historical episodes in the history of the town. In the first week of August, Hadley, Mass., commemorated the 250th anniversary of its founding. In the week ending July 21, the city of Geneva celebrated the 400th anniversary of the

birth of John Calvin and the 350th anniversary of the founding of the University of Geneva. On July 6 was laid the cornerstone of an imposing international monument to the Reformation. On July 28-30 there was celebrated the 500th anniversary of the founding of the University of Leipzig. For mention of the Hofer centenary, see AUSTRIA-HUNGARY (paragraphs on History), of the anniversary of Italian Liberation, see ITALY (paragraphs on History), and of the Mistral anniversary, see FRANCE (paragraph on History). In the latter part of October there was celebrated in San Francisco the 140th anniversary of the discovery of the Golden Gate by Don Gaspar de Portolá in the year 1769. Combined with this was the celebration of the reconstruction of San Francisco from the effects of the earthquake and fire in 1906. The ceremonies included pageants of great beauty, parades and carnivals. The celebration was attended by a great number of persons from all parts of the country. The anniversary of the 100th year from the birth of Oliver Wendell Holmes was observed in August, and in December the centenary of the birth of Gladstone was celebrated in England and in the United States. Especial attention was given to this celebration by the combined meeting of the American Historical Society, the American Economic Society, and other societies in New York City. Two interesting anniversaries were those of the founding of the *Edinburgh Review*, and the *Cornhill Magazine*.

LAKE CHAMPLAIN. Beginning July 4, there was celebrated the 300th anniversary of the discovery of Lake Champlain. The States of New York and Vermont participated in the celebration, and it had in addition an international interest, as Ambassador Bryce of Great Britain and Ambassador Jusserand of France represented their respective countries, and a detachment of troops from Canada also took part in the exercises. The celebration began on July 4 at Crown Point and on successive days removed to Fort Ticonderoga and Plattsburg in New York, then to Burlington, Vermont, and last to Isle la Motte near the Canadian line. On July 6, President Taft, Ambassador Bryce of Great Britain, Ambassador Jusserand of France, and Vice-Admiral Uriu of Japan participated in the ceremonies. The exercises of that day were held at Fort Ticonderoga, and the President in his address made reference to the deeds of valor done in that locality in which France, England and America were concerned. Mr. Bryce spoke of the historical memories clustering about the ruins of the old Fort, and the French Ambassador expressed the goodwill of France towards America and Great Britain. On July 5, historical addresses were delivered at the site of the old fort, St. Frederic, by Governor Hughes of New York, Seth Low, and Judge Barnes of Chicago. At Crown Point effective pageants were given representing historical occasions. On July 7, Senator Root was the orator of the day at Plattsburg. At each of the towns at which celebrations were held Governor Hughes of New York and Governor Prouty of Vermont were the official spokesmen. Canada was represented by Postmaster-General Rodolphe Lemieux, who made several notable addresses. Addresses were delivered also by Hamilton W. Mabie and others, and poems were read by Clinton Scollard, Percy W. Mackaye and Bliss Carman. The most picturesque feature of the celebration was a pageant given by 175 Indians

on a floating island in the lake. The island, which was built on scows arranged as a catamaran, was covered with trees, the lodges of Indians and a palisade of pointed logs with a great gate in the middle and inside several log houses and other huts, all built in the original style of the Iroquois. The Indians were said to have been descendants of the Indians whom Champlain and his successors knew. They presented the Indian version of the story of Hiawatha and reproduced the victory of Champlain and his Indian allies over the Iroquois. The island was towed from place to place on each day of the celebration and the pageant was there given. At Plattsburg was held the great military parade, composed of United States regulars, New York militia, members of the Grand Army, and the Governor-General's foot-guards from Ottawa and the Fifth Royal Canadian Highlanders from Montreal. In spite of their remoteness from the great centres of population the celebration was attended by a great multitude of people.

HUDSON - FULTON CELEBRATION. Beginning September 25, there were celebrated in New York City and in other cities along the Hudson River, the 300th anniversary of the discovery of that river by Henry Hudson. Along with this was celebrated also the 100th anniversary of the successful inauguration of steam navigation on the Hudson by Robert Fulton, although the year 1907 was the centennial of that event. The preparations for the celebration were undertaken long before its actual consummation. A committee composed of prominent citizens had been appointed, at the head of which was General Stewart L. Woodford, and a large sum of money had been granted by the city government. Invitations to foreign nations to participate were cordially accepted, and Great Britain, France, Germany, Italy, Netherlands, Mexico, and Argentina, sent squadrons of war vessels to take part in the celebration. The British representation, under the command of Sir Edward Seymour, Admiral of the fleet, comprised the *Drake*, the *Argyll*, the *Duke of Edinburgh* and the *Invincible*. Germany sent, under the command of Admiral von Koerster, the *Dresden*, *Bremen*, *Hertha*, and the *Victoria Luise*. The French squadron consisted of three war ships, *Justice*, *Verité* and *Liberté* under the command of Rear-Admiral Lepord. From Italy came the *Etruria* and the *Aetna*, from the Netherlands the *Utrecht*, from Argentina the *Presidente Sarmiento*, from Mexico the *Bravo* and from Cuba the revenue cutter, *Hatney*. In addition to these there was present a great squadron of United States war ships, the finest in the navy. The most interesting of the naval exhibits, however, was the replica of the *Half Moon*, Hudson's ship, made in Holland and presented by that nation to take part in the festivities. The vessel was manned by Dutch sailors and commanded by Dutch officers. Scarcely less interesting was the model of the *Clermont*, the original steam vessel invented by Robert Fulton, which made the initial trip by steam up the Hudson. This little vessel was made in all respects like the original, as far as could be done from plans and descriptions available. Among the official visitors during the celebration were Prince Kuni, representative and cousin of the Mikado of Japan, and delegates from France, Belgium, Holland, Norway, Italy, Russia, Turkey, Morocco, Cuba, Mexico, Argentina, Chile, Peru, Venezuela, Ecuador,

Honduras, Nicaragua, Paraguay, Salvador, Uruguay, Haiti, Costa Rica and Panama.

The first event in the celebration was the marine parade on Saturday, September 25. The war ships of the United States and the visiting war ships were anchored in the Hudson forming a long line many miles in extent. Along this line a procession of vessels headed by the *Clermont* and the *Half Moon* passed. It is estimated that the line of vessels of all sorts taking part in this parade was more than 40 miles long. It passed from the Statue of Liberty to the beautiful Water Gate at 110th Street, erected as a landing place for the visiting officers and men of the battleships. Here took place the ceremonies attendant upon the presentation of the *Clermont* and the *Half Moon* by the Hudson-Fulton Celebration Commission and here the two little craft were anchored. There were said to have been over a million people gathered along the New York and New Jersey banks of the river as the line of vessels passed.

On Tuesday, September 28, was held the first of the great land pageants. This was a historical pageant setting forth the history of Manhattan Island from before the advent of Hudson until the present time, by means of allegorical floats.

On Thursday, September 30, was held the great military parade, which was participated in by 25,000 men, including those from the visiting war ships, sailors from the United States vessels and many thousands of troops from the military organizations of the State. There were also in the line veterans of the Grand Army of the Republic and the Spanish War, cadets from the Military Academy at West Point, and a detachment of soldiers from the regular army.

Saturday, October 2, was Children's Day and the ceremonies were participated in by some 150,000 of the smaller pupils of the public and parochial schools of the five boroughs. On Saturday night a carnival parade, arranged by the German, Austrian and Swiss societies of the city, closed the celebration as far as New York City was concerned.

One of the events of the celebration most eagerly looked forward to was the aëroplane exhibitions which Wilbur Wright and Glenn H. Curtiss had planned to give. The flying machines were housed on Governor's Island, but during the celebration week proper the weather conditions were propitious only for short flights. On October 6, however, Wright flew in his aëroplane around the Statue of Liberty. Curtiss was unable to fly at all and he was compelled to leave to keep other engagements before he had succeeded. On the second Monday of the celebration Wilbur Wright made a trip from Governor's Island to Grant's Tomb and over the war ships in the river. This trip was entirely successful and was witnessed by thousands along his route.

The celebration continued in cities along the Hudson River for a week after it had concluded in New York City. There were celebrations in Albany, Troy, Newburg, Stony Point, Yonkers, Poughkeepsie, Catskill, Hudson, Kingston, Ossining, Croton-on-the-Hudson, and Haverstraw. The *Clermont* and the *Half Moon* participated in these celebrations and addresses were delivered by Governor Hughes and others. The actual culmination of ceremonies was a series of beacon lights along the Hudson from New York City to Albany, which were burned as a

farewell illumination at nine o'clock on the evening of Saturday, October 9.

Among the important features of the celebration was the dedication of statues, tablets and other memorials by various patriotic societies and organizations in different parts of the city. On September 27, was dedicated the Palisades Interstate Park at the old Cornwallis Headquarters at Alpine Landing, N. J. The Park was accepted on behalf of the State by Governor Hughes. On the same day was dedicated the Henry Hudson monument to be erected at Spuyten Duyvil on the Hudson. This monument is to cost \$100,000 and the cornerstone was laid on this date. A tablet was placed on the site of Fort Tryon at 197th Street under the auspices of the American Scenic and Historic Preservation Society.

Many notable art exhibits illustrative of the period commemorated were held in New York City. At the Metropolitan Museum of Art was a special display of over 130 paintings by Dutch masters of the 17th century. In the same museum there was also a special display of American Colonial art, including silver. At the National Arts' Club there was an unusually interesting exhibition of paintings, drawings, engravings and art objects, illustrating 300 years of New York City in its colonial, revolutionary, 19th century and 20th century periods. At the American Museum of Natural History there were shown original objects illustrating the life of the Indians who were displaced from Manhattan Island and the Hudson River following Hudson's discovery. At the New York Aquarium and at the New York Botanical and Zoölogical Gardens there were special collections of fishes, birds and animals, peculiarly related to the Hudson River. Many other societies held exhibitions in some way appropriate to the time and the occasion.

In England also a notable series of pageants which began in 1905 was continued during 1909. In the pageant held at Bath most of the episodes showed historical events connected with the local Baths from the time of the Roman occupation to the days of Beau Nash. At Cardiff were celebrated with a series of pageants events directly or indirectly famous in the history of Wales. Other pageants also were held at Colchester, at Fulham Palace, and perhaps the most notable of all, at York, where the history of the city from the earliest times until the great civil war was displayed in a striking series of episodes. During 1910 pageants are proposed at Chester and London (the "Pageant of Empire").

CENTRAL AMERICA. That part of North America lying to the south of Mexico. It includes the republics of Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica, and the colony of British Honduras. These states are treated under their own titles. The most important event of recent years was the establishment of the Central American Court of Justice, which opened at Cartago, Costa Rica, on May 26, 1908. It is designed to adjust matters in dispute between the Central American republics. On January 20, 1909, delegates of the several republics met in the first Central American Conference, at Tegucigalpa, Honduras. A convention was agreed upon for the unification of the monetary system, customs duties, weights and measures, fiscal laws, and consular service. Regarding

the monetary system, the Conference prescribed the gold and silver peso in parity and of the value of the American dollar as the basis of the currency which was to be established, and left to the Conference of 1910 (to meet at San Salvador, January 1) the fixing of the date from which the several governments should proceed with the conversion of their monetary systems. It was decided that the new coinage should consist of the following pieces: 20, 10, 5, and 1 peso gold; 1, 0.50, 0.25, and 0.10 peso silver; and 0.05 and 0.01 peso nickel. Regarding weights and measures, the Conference prescribed the metric system, to become effective on such date as the next Conference should select. In respect to customs, it was decided that imports and exports of the five republics through their frontier custom houses should be free of duty, except articles subject to monopoly. Further consideration of customs duties and of fiscal laws was left to the next Conference. It was agreed that at each of the various consular places in foreign countries a single consul represent the five republics. The operation of this convention was to begin on the date of the last ratification and remain in force until one year after it should be denounced by one of the signatory governments.

CENTRAL AMERICAN COURT OF JUSTICE. See ARBITRATION, INTERNATIONAL.

CENTRAL BANK. The discussion on the problem of reforming our banking and currency systems centred largely upon the advisability of establishing a central bank in this country. It was pointed out, on the one hand, that the United States is the only important commercial nation that does not have a central bank; but, it was stated, on the other hand, that banking conditions in the United States are materially different from conditions in England, France and Germany, the nations profiting most from a central bank. While some were inclined to argue on the basis of historical developments in other countries that the central bank represents the highest and final form in the evolution of banking institutions, others laid stress upon the difference between the relatively small and homogeneous countries with a few banks dominated by a central bank and the United States with its immense territory, sectional differences and its 25,000 banks.

Through the utterances of Senator Nelson A. Aldrich, early in the summer, it was made certain that the National Monetary Commission (q. v.) was strongly inclining toward the central bank idea. From his study of European banking history and institutions, Senator Aldrich was led to the conclusion that the reason why there has been no general suspension of banking institutions and no general destruction of credit in any European country during the last fifty years is the power of the central banks. He pointed out that during times of panic or money stringency, the great central banks strengthen their reserves and extend credit liberally to firms and institutions whose condition is sound. Senator Aldrich, at the same time, declared that two absolute essentials of any central bank plan would be to insure "that control of the monetary system shall be kept free from Wall Street influences, and that it shall not be manipulated for political purposes."

One of the chief advocates during the year of a central bank was Mr. George M. Reynolds,

THE HISTORICAL PAGEANT PASSING THE COURT OF HONOR
THE HUDSON-FULTON CELEBRATION AT NEW YORK CITY

a leading banker of Chicago and President of the American Bankers' Association. While he did not favor the destruction of the present system, or any great reduction of the functions now enjoyed by national banks, he favored a central bank, with capital of not less than \$100,000,000. He would make this bank the sole depository of government funds, give it authority to discount sound business credits for 90 days or less, and to issue notes secured in part by coin and in part by short-term commercial paper. Such a bank would form a large credit-creating power to which other banks and business men could go for discount accommodations under all circumstances. It would thus become a potent factor in the prevention of panics and an important regulator of the alternating periods of redundancy and stringency in the money market.

Mr. George E. Roberts, a prominent banker and formerly Director of the Mint, came out in favor of the central bank, particularly because of the lack of unity among American banking institutions. He stated that it was the lack of organization, of leadership, and of reserve power, due to local influences and excessive competition, that led to the frequency and severity of panics in this country. He believed that a central bank should be started, with as few changes as possible in present conditions; but he felt certain that such a bank should have more than a mere clearing house organization; it should have a paid-up capital and a gold reserve; should do business only with other banks; and should be empowered through note issues to supply an important part of the paper money of the country.

Professor O. M. W. Sprague, of Harvard University, writing in the *Quarterly Journal of Economics* and elsewhere, while agreeing with Senator Aldrich that the problem before the country is the organization of credit rather than the modification of currency arrangements, was inclined to point out practical difficulties and objections. He pointed out the absence of branch banking in this country, and the evil of concentrating banking reserves at one point in a country like the United States. He declared that the advocates of the central bank continually emphasized the importance of facilities for extending banking credit, but failed to consider the equally important necessity of restraining the expansion of credits during times of business confidence and speculative activity. He stated that without due restraining power a central bank through the very facilities would simply add fuel to speculative extensions of credit. He pointed out that owing to the extraordinary extent to which checks are used in this country, notes furnished by the central bank to other banks would become the basis of deposit credit to several times their amount, thus making possible an undue extension of banking credit. Moreover, as he indicated, the exercise of necessary restraining power and the proper contraction of credits by the central bank would be rendered extremely difficult, if not impossible, by the independence of local bankers all over the country and the probable difference between their views and those of the central bank management.

Probably the most widely discussed proposal for banking and currency reform not based on the full acceptance of the central bank idea was that put forth by Mr. Victor Morawetz in

various articles and addresses, and in his book on *The Banking and Currency Problem in the United States*. He starts with the proposition that the panic of 1907 was a banking panic; the underlying industrial conditions generally were sound, but the failure of a few banks demoralized credit relations and brought disaster to business. Finding the immediate cause of that breakdown in the undue expansion by the banks of their deposit liabilities as related to their cash reserves, Mr. Morawetz declares the primary problem is to devise a plan that will enable banks to extend their credit to the greatest extent consistent with safety, and no further. He finds also that temporary money stringency, due to a variety of ordinary business causes, render banks unable to perform normal services often when most needed. A second aim therefore should be to enable banks to expand their deposit liabilities, loans and discounts, while increasing their reserves. What, then, are legitimate or true banking reserves? Mr. Morawetz rules out deposits made by one bank with another, bank notes, call loans, and stocks and bonds, even though readily salable. All of these may strengthen the position of particular banks holding them, but do not strengthen the general banking situation, for one bank can utilize the above resources only by securing lawful money from another bank. Therefore the only true banking reserves consist of legal-tender money. The author estimates that banks in the United States taken collectively carry cash equal to only about 8.5 per cent. of deposits; while the Bank of England holds a reserve of 50 per cent. against deposits and a separate full reserve against its notes, the Bank of France a reserve of 80 per cent. against deposits and notes, and the Imperial Bank of Germany about 40 per cent. against deposits and notes.

Therefore, it is necessary to ask how United States banks can increase their reserves. Mr. Morawetz thinks this should not be done by the issue of more legal-tender silver dollars, or more greenbacks, but by increasing the amount of gold in banks and by the issue of bank notes to replace legal money now in circulation. He argues that if bank notes are considered perfectly exchangeable for legal money, the latter will become available as bank reserves. How, then, shall the notes be issued? Not by each bank independently, as in Canada and Scotland, with, respectively, thirty-four and eleven banks; not by a central bank, as in England, Germany, and France, for political impediments to such a bank are insurmountable; not by an emergency circulation, for that will become available only in times of extraordinary stress, and will not prevent such times; not by the national government; and not by any guaranty scheme, for that "would weaken the strong banks far more than it would strengthen the weak banks." Mr. Morawetz, therefore, advocates the establishment of a central agency with power to regulate the issue and redemption of national bank notes. The national banks, he believes, should be authorized to form an association having as its sole purpose the issue of notes on the joint credit of its members. The members must have aggregate capital stock of at least \$250,000,000. The association would establish branches in every city of 100,000 population

or over for the redemption of notes. Each member would deposit lawful money with the association for the redemption of notes. The board of managers of the association would work in conjunction with the Treasury Department.

See NATIONAL MONETARY COMMISSION, FINANCIAL REVIEW and BANKS AND BANKING.

CERVERA Y TOPETE, PASCUAL, COMTE DE JEREZ. A Spanish admiral, died on April 3, 1909. He was born at Jerez, province of Cadiz, in 1830. He was educated at San Fernando (1848-51) and served in the next succeeding years on several training ships. He served with distinction during the campaign against Morocco in 1859, and was made a first lieutenant. In 1862 he took part in the expedition against Cochin-China, and was afterwards appointed attaché of the Spanish legation at Washington. Following this he was made captain, and commanded a vessel sent to Peru during the war of 1866. On the outbreak of the Ten Years War in Cuba (1868-78) Cervera was engaged in blockading Cuban ports, but was recalled and made Secretary of the Navy. He was advanced to the rank of admiral, and soon thereafter given command of the *Pelayo*, the earliest first-class battleship of the Spanish navy. He was next made adjutant to the Queen Regent, and was chief of the Spanish Commission sent to the European Naval Conference in London in 1891.

Admiral Cervera vigorously opposed war with the United States in 1898, on account of the unpreparedness of the navy for such a conflict. He was, however, placed in command of the squadron sent to America. This consisted of the cruisers *Infanta Maria Theresa*, *Cristobal Colon*, *Almirante Oquendo*, and *Viscaya*, and the torpedo boat destroyers *Terror*, *Furor*, and *Pluton*. The squadron sailed from Cadiz on April 8, and successfully eluded the American fleet, reaching Santiago de Cuba about May 19. The harbor was at once blockaded by the American fleet under Admiral W. T. Sampson. On July 3, at the command of his government, and under his own protest, Cervera made a dash from the harbor with his squadron. In the running fight which followed, his vessels were entirely destroyed, and he was taken prisoner. He was detained in the United States until September 12. His courage and dignity commanded high admiration, and he was treated more as an honored guest than as a prisoner of war. On his return to Spain Admiral Cervera was subjected to a perfunctory court-martial and was acquitted. His published account of his expedition justified his protests made prior to the war. It showed a remarkable condition of unpreparedness and inefficiency in the Spanish navy. In 1902 Admiral Cervera was appointed chief of staff of the navy, and in 1903 he was

made a life senator. In 1907 he was chief of the maritime district of Ferrol. For two years prior to his death he lived in retirement.

CEYLON. An island in the Indian Ocean, south of Hindustan; a British crown colony. Capital, Colombo.

AREA AND POPULATION. Area, 25,332 square miles. Population (1901), 3,578,333; estimated, December 31, 1907, 3,988,064; December 31, 1908, 4,038,456. The Sinhalese in 1901 numbered 2,331,045; Tamils, 953,535; Moormen, 228,706; Burghers, Eurasians, 23,539; Malays, 11,963; Europeans, 9509; Veddas (aborigines), 3971. Excluding the military, the shipping, and the Boer War prisoners, the population in 1901 totaled 3,565,954, 65.8 per cent. of whom were engaged in agriculture, 17.2 per cent. in manufactures, and 3.5 per cent. in commerce. The immigrants on tea estates formed 12.4 per cent. of the population. The birth rate in 1907 was 32.8 per 1000 inhabitants; the death rate, 30.1. Colombo had (1901) 158,228 inhabitants; Galle, 37,316; Jaffra, 33,870; Kandy, 26,519.

EDUCATION, ETC. There were in 1907 government schools 616, with 75,589 pupils; grant-in-aid schools 1680, with 166,234 pupils, and 1758 unaided schools, with 33,869 pupils. The Technical College had 256 students. The Royal College and other high schools receive grants-in-aid.

The population was divided according to religions (1901) as follows: Buddhists, 2,141,599; Hindus, 828,622; Mohammedans, 248,140; Christians, 362,018.

PRODUCTION. There are 2,449,012 acres (or about one-fourth of the island) under cultivation, and 662,152 under pasture. The areas under leading crops in 1908 were: Cocoanuts, 915,373 acres; rice, 680,239; other grain, 106,635; tea, 553,348; rubber, 131,695; cinnamon, etc., 54,423; cocoa, 39,788; tobacco, 14,060; coffee, 1910; cinchona, 1066. Cardamoms, cocoa, and camphor are produced. The live-stock in 1907 numbered 1,559,271 cattle, 98,746 sheep, 3985 horses, 179,123 goats, and 96,305 swine. Ceylon is rich in precious stones, having (1907) 3366 gem quarries. The pearl fishery in the Gulf of Mannar yielded (1906) a revenue of Rs. 1,449,192 (1 rupee = 33.44 cents). There were (1907) 947 plumbago mines. The government salt monopoly yielded in 1908 a revenue of Rs. 1,760,551. Native industries are gold, silver, ivory, and tortoise shell work, pottery-making, wood-carving, metal work, etc.

COMMERCE. The total imports were valued in 1907 at Rs. 129,316,757; exports, 129,570,001; in 1908, at Rs. 130,291,908 and 130,170,406 respectively. Coal, cottons, machinery, metals, fertilizers, and petroleum are principal imports. The chief exports and the amounts for 1907, 1908 and the first six months of 1909 are given as follows:

	1907	1908	1st 6 of 1909
Black tea, lbs.	169,923,623	167,089,011	87,262,16
Desiccated cocoanuts, lbs.		26,486,222	10,526,94
Cocoanuts, number		20,509,824
Cinnamon, lbs.		5,745,139	2,463,90
Green tea, lbs.	6,526,563	6,216,805	2,462,190
Citronella oil, lbs.		1,276,965	878,697
Rubber, lbs.	530,908	831,905	497,677
Copra, cwts.	347,970	729,140
Cardamoms, lbs.		665,217	338,060
Cocoanut oil, cwts.	460,683	629,122	186,940
Plumbago, cwts.	614,156	489,338	289,789

The trade with Great Britain amounted to £1,759,320 for imports and £5,127,398 for exports in 1908.

COMMUNICATIONS. In 1909 there were 567 miles of railway open to traffic; the post and telegraph offices numbered 402, and there were 4063 miles of telegraph wire. There were in the merchant marine, January 1, 1908, 142 sailing vessels of 12,229 tons and 9 steamers of 1537 tons. Shipping entering Ceylon ports (1906), 6,897,329 tons.

FINANCE. The unit of value is the rupee, worth 33.44 cents. The revenue and expenditure in 1908 were Rs. 35,572,850 and Rs. 35,032,055 respectively, against 36,573,844 and 35,291,521 in 1907. The principal sources of revenue in 1907 were: Government railways, Rs. 10,741,008; customs, 9,189,922; arrack, rum, and toddy license, 4,260,850; stamps, 2,521,453; port and harbor dues, 2,135,632; sale of government timber and salt, 2,007,723; land sales, 1,914,071. Principal items of expenditure: Interest on public works (annually, recurrent and extraordinary), Rs. 7,066,516; establishments, 9,009,171; interest on loans, 3,651,063; military expenditure, 1,801,310; pensions, etc., 1,492,652; other charges, 10,026,733. The public debt amounted in 1908 to £4,566,402 and Rs. 3,111,086, incurred entirely for public works and railways. The Ceylon Savings Bank had (December 31, 1906) deposits amounting to Rs. 4,679,480; the Post-Office Savings Bank (1907), Rs. 2,117,119. Five external banks have establishments in Ceylon.

GOVERNMENT. Ceylon is administered by a governor, aided by an executive council and a legislative council. Governor (1909), Sir Henry Edward McCallum.

The Maldive Islands, lying 500 miles west of Ceylon, are nominally tributary to the Ceylon government. The hereditary Sultan resides at Mali. The natives (about 30,000) are Mohammedans.

CHAMBERLAIN, GEORGE EARL. An American public official, United States Senator (Democrat) from Oregon. He was born in Natchez, Miss., in 1854, and graduated from Washington and Lee University in 1876. In the same year he removed to Oregon. He was elected to the legislature in 1880 and was district attorney of the Third Judicial District from 1884 to 1886. In 1891 he was appointed Attorney-General of the State and was elected to the same position in 1892, serving until 1895. He was elected district attorney for the Fourth Judicial District for a four-year term in 1900, and was elected Governor of the State for the terms 1903-7 and 1907-11. Senator Chamberlain is a Democrat, but in spite of this was twice elected Governor in the strongly Republican State of Oregon, and occupies the unique position of having been elected United States Senator by a Republican legislature. This was brought about as the result of the operation of the primary laws in Oregon, by which the voters in 1908 indicated Senator Chamberlain as their choice for United States Senator. The legislators elected were pledged to vote for the people's choice and therefore were obliged to elect Senator Chamberlain, although the majority of them opposed him politically.

CHANG CHIH-TUNG. A Chinese states-

man and scholar, died October 4, 1909. He was born in the province of Chih-li in 1837. From his early youth he showed exceptional literary ability and to this was due his rapid advancement and national reputation. His reputation outside of China is associated chiefly with the vice-royalty of the Hukuang Province, which he held from 1889 until 1907. He took a strong stand in 1900 against the Boxer uprising, and largely through his efforts the peace of the Yang-Tsze provinces was maintained. His administration of his province was clean-handed, but he lacked capacity for management and patience in organization. His vanity made him an easy prey to flatterers and dishonest subordinates. In 1898 he published a pamphlet intended to draw his countrymen away from following after strange gods. His hostility toward foreign civilization showed in 1904 when he contemptuously criticised Sir Robert Hart's proposals for reform in the collection of the land tax. Although Chang Chih-Tung, judged by Western standards, was not conspicuous as an administrator or statesman, he had a high reputation in China as a literary figure.

In his relations with foreigners he followed the traditional Chinese policy of "playing off one barbarian against the other." He instinctively disliked and distrusted all, but used each and all so long as he could do so for his country's benefit and with a keen insight into the exigencies of European politics. He was considered to be the greatest scholar in the Chinese Empire, and although he held a lucrative office forty-four years and had been Governor-General in succession of three of the richest vice-royalties of the empire, he died a poor man. At the time of his death he was a grand councillor of the empire.

CHAPMAN, HENRY CADWALADER. An American physician and naturalist, died September 8, 1909. He was born in Philadelphia in 1845 and graduated from the University of Pennsylvania in 1864, and from the medical department of the same institution in 1867. After study abroad, he became, in 1870, lecturer on anatomy and physiology in the University of Pennsylvania. In 1880 he was appointed professor of the institutes of medicine and medical jurisprudence in the Jefferson Medical College. From 1875 he was curator of the Philadelphia Academy of Natural Sciences. His studies of the fauna and flora and the deep sea life of the coast of Maine are very valuable. Among his published works are *Evolution of Life*; *Treatise Upon Human Physiology*, and *Medical Jurisprudence and Toxicology* (1903). He contributed also to medical journals.

CHARITY ORGANIZATION. The year 1909 has shown a steady growth of the organizing spirit manifest during the last few years in dealing with relief work and philanthropy. The conferences have been more numerous, as a rule better attended, and uniformly more harmonious in their relations one to another. In addition to the National Conference of Charities and Corrections there took place State conferences, an international conference, and a Canadian conference.

At the thirty-sixth session of the National Conference of Charities and Corrections, held at Buffalo, in June, the attendance showed a

gain both from the more conservative States and from the newest States. There was, too, a tendency toward broadening the work of the Conference; almost every department has annexed some new movement more or less closely related to itself. "Children" now supplants "defectives" as a subdivision, and "Neighborhoods and Municipalities" has been annexed to "Needy Families." In the more technical sections, such as "Immigrants" and "Statistics," expert talent is introducing a higher degree of efficiency. The Conference draws to its vicinity many kindred movements, denominational and sectional, which contribute to greater systematization of the nation's relief work, and more ready diffusion of ideas. The directors of the Russel Sage Foundation, board of probation, and those interested in juvenile courts met in the Conference week.

The election of Jane Addams of Chicago as president of the 1910 Conference, which will meet in St. Louis, was a tribute both to her and to the work done by many women in the various committees. Alexander Johnson, Fort Wayne, Ind., was elected general secretary.

In the section meeting devoted to Immigrants, a paper on "The Immigrant Finding Work," brought out clearly the part that unreliable employment agencies play in creating vagrants. The adjustment of schools and courts to the immigrant's needs, and a discussion of the care of the immigrant's children also were carefully treated.

Statistical data on the various problems treated in all the sections was furnished by the statistics section, and added greatly to an intelligent planning of the next year's work.

In the section devoted to Lawbreakers, Dr. Katharine Bement Davis described the reform system at the New York State Reformatory in Bedford, where girls enjoy working at such unusual open air occupations as concrete walk laying, stair-building, and ice harvesting. Constructive education instead of mere protection of property and the tendency of too many laws against petty misdemeanors to increase their prevalence were discussed by other speakers.

The discussions on public health treated the milk problem, and particularly that of milk for babies, in an exhaustive manner; they also developed the need of more effective use of the already large body of knowledge on sanitation. Increased efforts are to be made in the future to secure greater publicity for the proceedings of the Conference and for the activities and policies represented in it.

State conferences were held during the fall in Illinois, Pennsylvania, Rhode Island, Missouri, New York, Ohio, Indiana, Iowa, and Massachusetts. The New York conference was the occasion of an exhibition provided by private relief institutions of the State. The discussions were along the same general lines as the National Conference.

In October, the New York School of Philanthropy opened an evening course for social workers. There is a small registration fee, and examination and a diploma to all who complete the course are parts of the idea. The Society of Jewish Social Workers of Greater New York raised a guaranty fund of \$1000 to start the course.

CANADA. The Canadian Conference of Charities and Corrections was held at Toronto,

October 19-21. The attendance was very small, in spite of special rates on the railroads. The following subjects were treated in the meetings: The connection between unsanitary homes and crime; work bureaus as means of helping city families to get back to the farms; more closely systematized probation; the Church's opportunity to engage in social betterment; the indeterminate sentence; and the relief of indigent tubercular patients. Mr. J. J. Kiko testified to the good influence of woman probation officers on truants and their families. The new president is J. P. Downey, of Guelph, Ontario; F. M. Nicholson, of Toronto, was elected secretary-treasurer. The next meeting will be held in Guelph, Ontario, in 1910.

FRANCE. Seven international philanthropic societies in joint sessions at Paris in June, 1909, approved plans for a congress at Copenhagen in 1910. There were representatives present from nearly all countries of Europe, and the phases of relief work peculiar to each received critical attention. M. Loubet, former President of France, and M. Le Jeune, Minister of State in Belgium, were among the speakers. At the proposed Congress of Copenhagen the following subjects will be particularly emphasized: Relief of sick in rural communities; relief of aliens and a study of forms of international agreement; women in relief work; and relief of widows with young children.

CHARTER REFORM. See ELECTORAL REFORM.

CHASE, SOLON. An American farmer and former politician, died November 23, 1909. He was born at Chase Mills, Maine, in 1822, and was educated in the public schools and in the Gorham Seminary. He was a lecturer, editor and stump speaker and was one of the leading and most active campaigners for the Greenback Labor party from 1870 to 1884. In these campaigns he became one of the most widely known and picturesque figures. He was a candidate for Congress and made a tour of the Eastern part of the country with an ox team and wagon and made speeches from the vehicle. When the Greenback party died out he began the publication of a weekly paper and during his last years he wrote for various newspapers.

CHAUCHARD, HIPPOLYTE FRANCOIS ALFRED. A French merchant and art collector, died June 5, 1909. He was born in Paris in 1821 and began his business life as a clerk in a shop in that city. In 1854 he founded the Magasins du Louvre, in which he introduced several innovations which have since become features of great department stores—the ticketing of goods, the privilege of return or exchange, and widespread and original advertising. The business grew to great proportions, and in 1885 M. Chauchard retired, retaining, however, a share of the stock, which was said to yield him over \$1,000,000 yearly. He gathered together a wonderful collection of pictures and other works of art. Among them were seven of Millet's pictures, including "The Angelus"; forty Corots, several Rousseaus and Meissoniers, and many valuable bronze statues, tapestries, etc. To these treasures the French nation became the sole heir. M. Chauchard gave liberally to charity. He had many eccentricities, among them the fear of dying poor. He built for himself a mausoleum at an immense cost. His funeral in Paris was at-

tended by riots, in which an assemblage of 200,000 people took part.

CHAUTAUQUA INSTITUTION. A system for the advancement of popular education, founded at Chautauqua, N. Y., in 1874 by John H. Vincent and Lewis Miller. The local work of the Institution is done in connection with a summer assembly in a series of summer schools. The year 1909 was notable for several reasons, among them for the continuance of the general programme and for the popular audiences, the most notable event of which was a concert by the New York Symphony Orchestra before an audience of 8000 people. Important symposia were conducted on the following subjects: Religious Education, Social Service, Problems of Immigration, Health and Efficiency, and Country Life. The summer schools in 1909 were largely attended, the chief feature being the introduction of an increased number of courses in pedagogy, both theory and subject matter, and the installation of the Arts and Crafts School in a new building under a new director, Henry Turner Bailey. During the year the new Arts and Crafts building was completed and a new Post-Office and Print Shop were erected at an expense of \$30,000. The Commercial building, burned in October, 1908, was rebuilt at an expense of \$45,000.

CHEESE. See DAIRYING.

CHEMICAL AFFINITY. See CHEMISTRY.

CHEMICAL SOCIETY, AMERICAN. See CHEMISTRY.

CHEMISTRY. GENERAL PROGRESS. The progress of chemical science during 1909 was entirely normal. No startling chemical discovery came once more to deal a blow to inveterate notions of what is possible and what is impossible, and to arouse a new enthusiastic confidence in the future. Nor did any sudden, brilliant generalization come to disturb the international host of chemical investigators and attract them away from their accustomed fields of research. This, however, does not mean that chemistry had for the time being come to a standstill. On the contrary, the amount of new knowledge gathered during the year exceeded by far that gained during any of the previous years. The number of university research laboratories is rapidly increasing. Even colleges seem to be waking up to the fact that students can receive genuine scientific training, that is, training in the art of grappling with practical problems, only in an atmosphere of enterprise and research. College professors of science, especially of chemistry, are therefore more and more expected, not only "to know what the Germans have done," but to be on the level of independent thought and practical scientific activity themselves. The consequence is an increasing number of original contributions even from collegiate laboratories.

It would be impossible to give, within a limited space, an adequate account of the progress of chemistry during the past year. The brief and fragmentary account, given below, of a number of typical contributions will merely serve to indicate the principal directions of chemical research.

In the direction of knowledge of *chemical affinity*, one finds with pleasure an experimental study published under the names of Ipatieff

and Verchovsky. According to an old-fashioned notion, originating perhaps in medieval alchemy, a metal combines with an acid radicle, driving out and taking the place of the hydrogen of the acid, because metals have a greater "affinity" than hydrogen for acid radicles. According to an enlightened modern view of chemical affinity, the latter is akin to simple mechanical pressure, and therefore simple mechanical pressure can also modify it. Thus, the affinity of hydrogen for an acid radicle is not invariable in magnitude, but depends in a very pronounced manner upon the state of compression in which the hydrogen happens to be. The greater the pressure, the more intense the chemical affinities of hydrogen. Metals tend to dissolve in liquids, especially in water, under all conditions. The quantitative measure of that tendency, called technically the electrolytic solution tension of the metal, is also a measure of its chemical affinities. The chemical affinities of the metal, too, depend in a pronounced manner upon the external physical conditions of temperature, volume, and pressure. But, then, if under one set of conditions a given metal has a greater affinity than hydrogen for an acid radicle, the affinities may be reversed in magnitude under another set of experimental conditions. It is this variable nature of chemical affinity, its dependence upon external physical conditions, that has only been realized by chemists in recent years. Guided by the new conception of affinity, Nernst and Tammann undertook, some years ago, to keep metallic zinc from combining with and dissolving in sulphuric acid by enclosing them together in a tube containing highly compressed hydrogen gas. Under the conditions chosen for the experiment, the affinity of zinc for the sulphuric acid radicle was equal to the affinity for that radicle possessed by hydrogen under a pressure of 270 pounds per square inch. If the pressure of the hydrogen fell below this figure, the zinc was victorious in its competition with the hydrogen for the possession of the acid radicle. As soon as the hydrogen pressure attained its 270 pounds per square inch, the zinc stopped dissolving in spite of remaining in contact with much free acid. It was reasonably expected that an increase of the hydrogen pressure beyond 270 pounds would result in the usual reaction being reversed, that is, in the zinc being driven out of solution by the hydrogen. But, for some reason or other, this part of Nernst and Tammann's experiment gave a negative result. The 1909 publication of Ipatieff and Verchovsky contains an extended series of results corroborating the modern view of affinity in every direction. Following are some of their most important observations: At temperatures above 120° C. (248° F.), hydrogen under comparatively small pressure drove metallic copper out of a copper acetate solution. At a higher temperature, hydrogen under a pressure of 3000 pounds per square inch readily overcame the affinities of mercury and silver for acid radicles and precipitated these metals in their free state out of aqueous solutions of their salts. The metals nickel, copper, lead, and bismuth were likewise overcome by compressed hydrogen. As in all research, certain obscure phenomena were encountered during this study also. Perhaps they will enhance the alluring power of this chapter of chemical research and keep it from being

abandoned by chemical explorers. But the main principle of the modern view of chemical affinity may now be considered as demonstrated by experiment.

In the course of the year Landolt published a final general summary of his own observations, extending over a period of eighteen years, and of the experimental results of other investigators, on the subject of the *conservation of mass* during chemical processes. The law of the conservation of mass, perhaps the most fundamental law in all natural philosophy, was first established by the founder of modern chemistry, the Frenchman Lavoisier. Lavoisier is well known to have been only a moderately good manipulator, and besides, the experimental means at his disposal were poor as compared with those of present day chemistry. And so, while the conservation of mass is indirectly supported by innumerable quantitative analyses carried out during the nineteenth century, the question has been raised in recent years as to whether chemical processes may not involve (perhaps by transformation into the imponderable ether) such minute losses of matter as would escape the attention of the chemist engaged in ordinary analytical work. Other investigators have come out with statements at least throwing doubt on the absolute validity of the conservation principle. Landolt, after eighteen years of the most painstaking experimental work, involving no less than fifteen different chemical reactions, and carried out with all the means and methods of modern experimental art, now puts an end to all doubt on the subject. Whatever, then, be the ultimate fate of the radio-active atom, and of material atoms in general, the balance fails to reveal the slightest deviation from the law of the conservation of mass.

An interesting paper concerning the *critical temperature* of substances was published by Bradley, Browne, and Hale. Since the researches of Andrews, memorable in the history of science, it is generally taught that for every substance there is a temperature above which it cannot exist in the liquid state no matter how great the pressure exerted upon it. That temperature is generally termed the critical temperature, or the critical point, of the substance. While certain theoretical considerations seem to render the existence of such a sharply defined temperature point *a priori* improbable, all experience hitherto seemed to have established it as a matter of indubitable fact. The authors of the recent paper in question have carefully reexamined the behavior of carbonic acid gas at, and immediately above, its critical temperature, which is generally known to lie at about 31.1° C. (87.98° F.). At temperatures between this critical point and about 38° C., that is, in an interval of about seven degrees above the critical point, Bradley and his collaborators were able to observe ripples—apparently liquid carbonic acid—running down the sides of the tube every time the volume occupied by the substance was more or less suddenly compressed. The authors conclude that a liquid does not really cease to exist as such at its critical point, but that, becoming equal in density to its own vapor, it no longer forms a continuous layer occupying a separate part of the tube, but distributes itself throughout the volume of the latter in the form of fine particles, which are liquid

nevertheless. The observations are not merely curious, but full of general scientific interest, because of their bearing on the problem of the states of aggregation, than which there is no more important problem in all physico-chemical science.

A promising study of the so-called *liquid crystals* was begun in course of the year by Von Weimarn at St. Petersburg. Since the introduction of the concept of liquid crystals into science by Lehmann twenty years ago, numerous attempts have been made to decide the question as to whether the turbid liquids said to be crystalline are really homogeneous or nothing but fine suspensions. Von Weimarn has now attacked the problem with the ultramicroscope. The conclusion which he draws from his experiments is that crystalline liquids are not homogeneous, as Lehmann and with him a majority of chemists and physicists are inclined to believe, but suspensions of exceedingly fine crystalline solid particles, in which, however, the crystal forces at work are exceptionally weak and which, moreover, are in mobile equilibrium with the liquid in which they are suspended. It would be rash to accept Von Weimarn's conclusion on the basis of the limited experimental evidence he has yet produced. On the other hand, it seems safe to hope for results of no inconsiderable value from a continuation of ultra-microscopic studies of the liquid crystalline state.

A valuable contribution to the methodology of *direct osmotic pressure measurement* was made by the Earl of Berkeley working in collaboration with Mr. Hartley. The principle of the new method proposed by these investigators is, briefly, as follows: It is well known that when a solution, say, of cane sugar, is placed in a cell with semi-permeable walls (usually porous porcelain with the pores clogged up with ferricyanide of copper), and the whole immersed in pure water, water will enter the cell, increasing the pressure within it, until that measure has become equal to the osmotic pressure of the solution. The velocity with which water will begin to flow into the solution will obviously be proportional to the osmotic pressure. And therefore, it ought to be possible to measure the osmotic pressure by measuring the initial rapidity of flow of water into the cell. It is this simple principle that Berkeley and Hartley have succeeded in developing into a practical working method and have utilized in carrying out a series of osmotic pressure measurements. Measurements of the flow of water into the cell yield figures proportional to the osmotic pressure involved. In order to obtain the osmotic pressures themselves, Berkeley and Hartley also measured the velocity with which water would enter the cell under the influence, not of the osmotic pressure within the cell, but of ordinary hydrostatic pressures from without, with nothing but pure water both inside and outside the cell. If the precaution is taken of keeping the temperature all but absolutely constant, the method yields figures of a high degree of precision. Even very small osmotic pressures can be readily determined by the new method.

Arthur A. Noyes, with a group of assistants and students, continued his able investigations of *aqueous solutions of salts*. A paper, under the names of Noyes and Johnston, published in the September number of the *Journal of the*

American Chemical Society, deals with solutions of more complex salts than had hitherto been studied. It has long been known that salts containing only simple univalent ions, such as ammonium chloride, sodium nitrate, potassium bromide, etc., are associated electrolytically to all but exactly the same extent in solutions containing equivalent quantities of them. Noyes and Johnston's study showed that this principle is true, not only for salts of the univalent, but for a set of salts of any other valence type. To use their own language, "For different salts of the same ionic type at any definite concentration and temperature the degree of ionization is approximately the same." Early in the history of the electrolytic dissociation theory, Arrhenius had shown that, curiously enough, with rising temperature the degree of dissociation of a dissolved salt decreases. That early study dealt, again, with only salts of the simplest valence type. Noyes and Johnston's investigation now shows also this principle to hold in the case of complex salts, and demonstrates, in fact, that the more complex the salt the more rapid the fall of its dissociation with rising temperature. It may be observed, in passing, that the apparatus employed in this investigation was the conductivity bomb invented by Arthur A. Noyes himself and permitting of conductivity measurements at almost any desired temperature. A most important result of the investigation was the discovery of a new set of discrepancies between the degree of dissociation indicated by the electrical conductivity and that indicated by the freezing temperatures of the solutions examined. The agreeing results yielded years ago by the two different physico-chemical methods in question formed one of the main props of the dissociation theory and did much toward its incorporation in science. The discrepancies now discovered by Noyes and Johnston, together with some discrepancies observed before, point to the incompleteness of our knowledge of solutions and seem to render necessary a serious modification of the theory of solutions now so generally adopted. Thus science grows, discovers its own weak points, then strengthens them by new growth.

Two contributions, the first by Rosanoff, Lamb, and Breithut, the second by Rosanoff and Easley, described a new method for measuring the *partial vapor pressures of binary mixtures*, gave the results of an extensive series of measurements, and developed a thermo-dynamic theory of the results. The fundamental principle of the new method is stated in one of the papers in the following terms: "If a mixed vapor of constant composition is passed through a liquid mixture of the same components, the composition and temperature of the liquid will steadily change until complete equilibrium, as regards both temperature and pressure, has been established. A stationary temperature will demonstrate the attainment of equilibrium. The vapor bubbling through the liquid may then be condensed in any desired quantity and analyzed. Identity of composition of two or more consecutive samples of the condensed vapor will be additional proof that perfect equilibrium had been established between liquid and vapor. On the other hand, the liquid can be drawn off and its composition determined by analysis." The new method is valuable in the first place because it carries its own check

of the results. Furthermore, as the published results show, the total probable error involved in the measurements does not exceed one-tenth of one per cent. In other words, the method is highly reliable and precise. One of the two papers points out that no property of a substance is more characteristic of its intimate physical condition than its vapor pressure, that in mixtures the partial vapor pressures are the immediate expression of the molecular condition and mutual influence of the components, and that therefrom follows the important rôle played by vapor pressures in physico-chemical science even at present, and the still more important part which that property is destined to play in the development of knowledge in the future. The second of the two papers proposes a generalization of Raoult's law, making it valid, not only for infinitely dilute solutions, as heretofore, but for solutions of all concentrations, and for binary mixtures of organic substances in general. The results yielded by this theoretical generalization agree with Rosanoff and Easley's measurements all but perfectly.

In organic chemistry no more important work was carried on than that by Emil Fischer on *the proteins*. The contents of the cells from which living tissues are built up consist of highly complicated albuminous bodies, called proteins. These albumens, unlike any other naturally occurring substances, will alone, in conjunction with water and salt, furnish nourishment sufficient for animal life and hence are of extreme importance from a physiological as well as chemical point of view. The synthesis of such substances Fischer is fast approaching step by step in the laboratory. The difficulties of investigating the constitution of such compounds are innumerable, they being non-crystallizable, non-volatile substances, and consequently purifiable with difficulty. They are extremely sensitive to heat, acids, and alcohol, and therefore very liable to be altered during ordinary chemical processes. Their molecular complexity is very great. Molecular weight determinations by the freezing point method show egg-albumen, for instance, to have a molecular weight of 15,000, and haemoglobin one of 50,000. Fischer has attacked the gigantic problem of determining the constitution of these albuminoids by first splitting them up by hydrolysis into simpler substances, amino-acids, whose constitutions were determinable, and whose syntheses were consequently possible. Nearly all of the numerous amino-acids thus obtained from the naturally occurring albumens have now been synthesized, and Fischer is engaged in combining these synthetic acids into a single molecule whose reactions shall resemble those of the original albuminoids. The complexes Fischer has now synthesized, while not themselves of the protein class, show sufficient resemblance to the naturally occurring substances to allow us to deduce the probable constitution of at least part of the albumen molecule. By the recombining of these amino-acids, Fischer has among some three hundred complexes synthesized an octadecapeptide named levo - leucyl - triglycyl - levo - leucyl - triglycyl - levo - leucyl - octaglycyl - glycine. This extraordinary substance has all the properties of the natural albumens, it is the most complicated system of known constitution hitherto synthesized. Its molecular weight is 1213. As, however, the

simplest occurring protein has a molecular weight approaching 10,000, a considerable advancement is still necessary before a true albuminoid can be synthesized.

Steady advancement in the *synthesis of alkaloids*, the most important of which are found in the tissues of plants, continues to be made, owing largely to the pharmacological importance of these substances, which renders a knowledge of their structure of the utmost value. Of the newest synthetic alkaloids, *stovaine*, named after its discoverer, E. Fourneau (French for stove) attracted much attention, owing to its marked anæsthetic properties. Stovaine, which is the hydrochloride of 1-dimethylamino-2-ethyl-2-propanol-benzoyl ester, is merely one of a numerous class of esters of tertiary alcohols synthesized by Fourneau, all of which act as local anæsthetics. In comparison with cocaine, which it promises largely to supplant, it has about the same anæsthetic power, but it is only one-third to one-half as toxic, and its effects subside more rapidly. It dilates the blood vessels, whereas cocaine contracts them. Likewise, it exerts a tonic action on the heart. A mixture of stovaine and strychnine is used for producing spinal anæsthesia. The discovery of the valuable physiological properties of this substance is stimulating a systematic search for esters of other amino-tertiary-alcohols, having the same properties in an even more marked degree, if possible.

A new example of what is now known as "negative catalysis" was found by Chapman and MacMahon in the effect of the presence of oxygen upon the reaction between chlorine and hydrogen. The subject as mentioned here is a contribution to that most important chapter of chemical dynamics dealing with *catalytic action*, which, according to Oswald's definition, consists in a hastening effect that the presence of certain substances has upon many chemical reactions. The most celebrated example of such an effect is the hastening by spongy platinum of the combination of sulphur dioxide with oxygen, which has revolutionized the sulphuric acid industry. Other well known and remarkable cases of reaction catalysis have in recent years been discovered, by Baker and Dixon, in the action of the merest traces of moisture on the reaction between hydrogen and oxygen, as well as between hydrogen and chlorine. Thus, the reaction between absolutely dry chlorine is so exceedingly slow, even at high temperatures, that ordinary chemical methods are incapable of detecting it. But so great is the hastening effect of the merest trace of water upon this reaction, that the introduction of a trace of moisture into the reacting mixture produces a violent explosion. It is easy to see why chemists are eagerly searching for more and more examples of catalysis. They hope, with reason, to gain insight into the mechanism of chemical action itself, when catalysis is understood. The number of known cases of negative catalysis, that is, the slowing up of reactions by the presence of foreign substances, is small as compared with the number of cases of positive catalysis. About three years ago such a case was discovered by Heinrich Goldschmidt in the action of water upon the combination of organic acids with alcohols. According to Chapman and MacMahon, the reaction between chlorine and hydrogen, which is

so enormously hastened by the presence of water, is rendered much slower by the presence of oxygen gas. In fact, they find the velocity of formation of hydrochloric acid gas from hydrogen and chlorine to be inversely proportional to the amount of oxygen present.

An interesting contribution to our knowledge of the *Walden inversion* was published in course of the year by McKenzie and Clough. The Walden inversion is one of the most remarkable puzzles of present day organic chemistry. Since Pasteur's classical researches on the tartaric acids, it had been supposed for many years that an optically active organic substance could not possibly be transformed into its antipodal variety except by racemization. In other words, an optically active substance, if changed at all, would be transformed into a pair of substances of equal and opposite rotatory powers, the resulting "racemic mixture" being of course optically inactive. The first exception to this law was discovered a few years ago by Walden, and since then several further exceptions have been reported by Emil Fischer and other investigators. McKenzie and Clough's paper describes a method by which dextro-mandelic acid may be transformed into levo-mandelic and back again. When, namely, phosphorus pentachloride is allowed to act on dextro-mandelic acid, it is transformed into a chloro-phenyl-acetic acid. This, in turn, treated with ammonia, yields an amino-phenyl-acetic acid. Finally, the action of nitrous acid upon the last-named compound, gives a mandelic acid. But, and this is the main point in the matter, the mandelic acid so obtained is not the dextro-mandelic acid started with, but the antipodal levo-mandelic acid. Conversely, if levo-mandelic acid is started with, the consecutive action of phosphorus pentachloride, ammonia, and nitrous acid, leads to the dextro-rotatory variety of mandelic acid. A rational theoretical explanation of the remarkable phenomenon of the Walden inversion has not yet been advanced. Meanwhile, as regards the step of McKenzie and Clough's process at which inversion takes place, these authors justly believe that the inverting agent is ammonia. Their view is corroborated by the observation that levo-amino-phenyl-acetic acid, inverted into dextro-bromo-phenyl-acetic acid by the action of nitrosyl bromide, is re-obtained in its original form by the action of ammonia upon the latter compound. The mechanism of McKenzie and Clough's process would, therefore, appear to be very much the same as that of the inversion of valine described by Fischer and Scheibler in 1908. A theory of the Walden inversion, when it appears, will undoubtedly make a new epoch in organic chemistry.

Claude succeeded in re-determining the amounts of *hydrogen*, *neon*, and *helium* in the air. According to these newest measurements, the air contains 0.0001 per cent. hydrogen gas, 0.0005 per cent. helium and 0.0015 per cent. neon. No wonder that one hundred years of air-analyzing by ordinary chemical methods had failed to reveal the presence of these gases.

An international group of investigators, with Theodore William Richards, of Harvard, by far the most important figure in the group, continued work on the determination of those important constants of nature, the atomic weights of the chemical elements. Richards's collected papers on the atomic weights, published during

the year in the form of a volume of nearly 900 pages in German, is a towering monument for American science of the past twenty-five years. The international committee of atomic weights adopted a number of recently published determinations, of which the most important follow. On the basis of William A. Noyes's synthesis of water, and of a number of older data, the atomic weight of hydrogen is 1.00779. On the basis of determinations by William A. Noyes and Weber, and by others, the atomic weight of chlorine is 35.460. The atomic weights of some of the other elements are: sulphur, 32.070; lead, 207.10; cadmium, from 112.50 to 112.88; tellurium, 127.5 (?); palladium, 106.75; niobium, 93.5; radium, 226.4. Several speculative papers were published, as usual, during the year, attempting to find and explain relationships between these characteristic constants of the elements. As yet all these speculations have been like sparks in the deep night; they have neither lasted nor left any light worth speaking of.

CHEMISTRY, INDUSTRIAL. The advances made during 1909 fail to reveal any very great discoveries, although distinct progress is evident. The results seem to show careful and persistent efforts toward the improvement of details in processes together with the announcements of new products, the value of most of which can only be determined by the test of time. An interesting feature of the development of industry in the United States is shown by the endowment of fellowships in various universities by chemical manufacturing firms for the purpose of enabling the incumbent to prosecute researches on the technology of the industries concerned.

ORGANIZATIONS. In the United States the American Chemical Society, presided over by Willis R. Whitney, held general meetings in Detroit, Mich., during July 29-July 2, and in Boston, Mass., during December 27-31. New local sections have been established in Milwaukee, Wis., Cleveland, Ohio, Seattle, Wash., and Columbia, Mo. On November 5 its Nichols medal was awarded to Leo H. Baekeland for his researches leading to the discovery of bakelite. The American Institute of Chemical Engineers held its second annual meeting in Philadelphia, Pa., December 8-10, with Samuel P. Sadtler as its president. It first meeting was in Pittsburgh, Pa., in 1908. The Society of Chemical Industry of Great Britain held its 28th annual meeting in London on May 26, and for a third time honored the United States by electing Ira, Remsen, of the Johns Hopkins University, as its president. The membership was reported as 4520. The seventh International Congress of Applied Chemistry was held in London during May 27-June 2, with Sir Henry E. Roscoe as president of honor, and Sir William Ramsay as active president. Harvey W. Wiley was chairman of the American Committee. It was decided to hold the next Congress in the United States in 1912, and for it E. W. Morley was nominated for the honorary, and W. H. Nichols for the active presidency. During October 14-23, the first annual Exhibition of Chemical Industries was held in London.

HYDROGEN AND OXYGEN. The science of aéronautics has led to the study of cheapening the cost of the buoyant gas employed in balloons. Ordinary illuminating gas has generally been used, but as hydrogen has over seven

times the lifting power of coal gas, its use is preferred. By the ordinary method of preparing hydrogen, as by the action of dilute sulphuric acid on iron or zinc, the cost was from \$4.25 to \$7 per 1000 cubic feet. A new method proposed in Germany is based on the interaction between steam and iron (in the form of borings or turnings) at a red heat whereby magnetic iron oxide is formed and hydrogen is liberated. Another process involves the reaction at 300° C. between water gas and calcium carbide. The latter substance combines with the carbon monoxide, carbon dioxide, and nitrogen present in the water gas and hydrogen alone remains in the gaseous form. The gas thus obtained does not require further purification before being conducted to gasometers for the purpose of storage. This cheapened hydrogen, 98 per cent. pure, is offered for sale at \$1 per 1000 cubic feet. The oxygen of commerce is now chiefly obtained by decomposing water electrically or by means of liquid air, from which the nitrogen, being more volatile than the oxygen, evaporates, leaving the latter. For the production of liquid air two processes are used, that of von Linde, whose machines give 600 to 1500 cubic feet of oxygen an hour, and that of Claude, whose apparatus yields 1500 to 3000 cubic feet hourly. The Linde company has in Germany four factories for the separation of the oxygen from liquefied air. In Paris the factory of Bardot is using powerful Linde machines, and two factories for producing 15,000 cubic feet are in process of construction in Hamburg and Gleiswitz. The quantity of oxygen turned out by the Linde processes alone is estimated at about 30,000,000 cubic feet yearly.

NITROGEN. Methods for the successful extraction of nitrogen from air and its combination in the form of a nitrate continue to be described. Plants have been established in Norway, Germany, Italy, and other European countries, and in Canada. The cost of the production of lime nitrogen containing 20 per cent. nitrogen is given as ranging from \$52.11 to \$60.79 a metric ton, i. e., 2204 tons. Experiments with fertilizers made synthetically in comparison with Chilean saltpetre are generally favorable to the artificial product. An aluminum nitride for use as fertilizer is being made in Mulhausen, Alsace, by first preparing an aluminum carbide by heating a mixture of alumina and carbon in an electric furnace. This is then mixed with a fresh quantity of alumina and heated with nitrogen gas. The inventor has obtained a crystalline aluminum nitride that contains as much as 34 per cent. of nitrogen. A new process for producing ammonia from atmospheric nitrogen has been developed from experiments in the synthesis of hydrocyanic acid. It consists essentially in passing over iron at a dull red heat a mixture of equal volumes of air and coal gas previously moistened by passing through distilled water. The yield of ammonia varied greatly with the temperature, the best results being obtained between 300° and 350° C.

METALS. The cheapness of aluminum is resulting more and more in its increasing use as a substitute for copper, especially where lightness is desired, as in the making of flying-machines. An alloy, called magnalium, is made by melting together aluminum and magnesium in a vacuum and then allowing the compound

formed to cool in a vacuum or under a pressure of 100 to 200 atmospheres. Different percentages of the constituent metals are used. This alloy, which has a very low specific gravity, is a solid silver-white metal that is capable of taking on high polish. Besides its use in the construction of aeroplanes, it is employed in Germany as a reflecting material for mirrors and in the manufacture of wire and tubes. The harder varieties of magnalium may be cast in the same way as aluminum. The discovery of an ore of antimony, said to contain 60 per cent. of the metal, in Servia, is of interest, as that country exported to the United States, during 1908, antimony valued at about \$3000. The extracting of the metal in Germany is by treating antimony sulphide with sulphuric acid in the presence of potassium sulphate at a temperature of 130° C. and boiling out the resulting compound formed by the antimony with the potassium salt. From this solution the oxide of antimony may be separated out by crystallization as white needles. Radium continues to occupy the attention of chemists. The sources of supply have been increased by the discovery of radium in the refuse of the abandoned copper and tin mines of Cornwall, England. An improved process for its extraction by means of which the radium is obtained directly, is announced, and the shorter time required for this process is a valuable feature. The finding of uranium deposits containing radium is reported from Portugal and from California, and from Vienna is the statement that from the deposits of Joachimsthal, the Minister of Labor of Austria will sell radium in vials, each to contain 60 milligrams of 5 per cent. radium or 30 milligrams of 10 per cent. radium, the price of such a vial to be 1080 crowns (about \$216), as the present market value of pure radium is estimated at \$60,000 a gram. Radium institutes have been founded in Vienna and in New York City for the study of radium and its applications, largely, however, with a view to its use in medicine.

METALLURGY. The steel manufacturers of Sheffield, England, early in the year announced their production of a steel with a cutting power quadruple that of any now known to metallurgy. This new product is said to be the first high speed steel that can be hardened in cold water without danger. Its improved nature is due to the hardening effect produced by the introduction of certain metals that are used instead of carbon. More recently American manufacturers have made claims for a high speed steel with a cutting power of seven times that of the ordinary steel. A torch operated by oxygen and acetylene, producing a heat of 4000° C., has been invented in Cleveland. By means of it it is possible to weld aluminum. The torch makes a flame that will cut through two inches of solid steel in less than a minute and pierce a 12-inch piece of the hardest steel in less than ten minutes.

Some of the phenomena displayed by metals under certain conditions are strikingly like those of organic bodies suffering from disease. Yellow phosphorus gradually assumes a new complexion if left to the agencies of time, finishing a beautiful dark red. The change that occurs when metallic tin crumbles to a gray powder when exposed to the cold is known as "tin plague" and it is known that the

smooth surface of the metal after an exposure to 16°-45° C. for two years becomes brittle and crystalline. "Tin plague" is even infectious, for on inoculating other masses of smooth polished tin with small portions of the crystalline metal, the "disease" spreads. Tinfoil succumbs to the infection in the same way and becomes crystalline and brittle right through. It would even appear that certain metals have their "illnesses," as if their activities were interfered with by a toxic process which may be pushed in many cases to such an extent that the metal "dies." It has been found that platinum, for example, in its colloidal form, in which it is very remarkably active, is positively "poisoned" by prussic acid or corrosive sublimate, and its great energies cease to act; it is killed.

FIBRE AND WOOD. In Australia there has been found a fibre resulting from the shavings of the leaf sheaf of a sea grass, which occurs in large quantities and has great commercial possibilities. It will spin and weave in union with wool, and will also take dye equally well, being the only vegetable fibre to do this. It is practically non-inflammable, and it is to that extent a non-conductor. It does not shrink, and has more resilience than kapok. It is also found to be as good for ship caulking as oakum. George D. Frankforter, of Minneapolis, Minn., describes a process of saving wood pulp from fir timber. He places small pieces of waste wood or sawdust in a steel incline over a furnace and forces distillation of the waste wood by saturating it with carbon disulphide, or gasoline, thus causing the turpentine and rosin to pass off as gases and leaving the wood pulp free from pitch and perfectly adapted to the manufacture of paper. It has been found that the wood pulp sulphite liquor, which has been regarded as without value, may be used as a road-dressing, yielding results showing that it compares favorably with oil and tar when similarly employed. A report from the Bureau of Engraving and Printing in Washington shows that it is possible to use a chemical solution or "bath" that makes the tough fibre of the banknote as good as new, does not injure the ink, and completely eliminates any dangerous bacteria. Melted wood is a novelty from France. Its preparation is described as follows: A metal receiver having a double bottom through which superheated steam passes, is filled with bits of wood; it is closed by a lid provided with a tube and stop-cock communicating with an apparatus for exhausting the air. When the wood thus kept in a vacuum is heated above 140° C., the water and other volatile substances are drawn off by means of the exhausting apparatus, after which the heating is continued for three hours. There then take place a complex series of reactions and phenomena analogous to those that accompany the distillation of wood in a closed vessel, and in this way all the so-called pyrogenous products are separated; these in turn are drawn off, condensed, and separated so that they may be utilized commercially. There remain in the receptacle only the fibrous skeleton of the wood and the mineral salts, which, taken together, constitute a fusible mass. This is allowed to cool slowly, out of contact with the air, and then placed in a second boiler which, after the air has been exhausted, is filled with nitrogen under a pressure of 1.5 to 2 atmospheres. The

whole is heated to 500° C. for two hours, and at the end of this time the wood is melted into a homogeneous, hard mass.

EXPLOSIVES. Oscar Guttman in a series of Cantor lectures delivered before the Royal Society of Arts in London in 1909 reviewed the entire field of progress in blasting and military explosives. The latest explosive to be invented in Germany is called "ammonal." It is essentially a mixture of pulverized aluminum with ammonium nitrate. Its method of operation is as follows: The pulverized aluminum, on being ignited, takes up the oxygen of the ammonium nitrate, generating an enormous amount of heat, and expanding the gaseous product with explosive force. Other explosives evolve noxious vapors, but ammonal gives off only nitrogen, oxygen, and steam, all substances beneficial, rather than harmful. A further advantage of ammonal is the complete safety of its manufacture. An explosive called "gerite" has been tested in Italy and it is claimed that it shattered steel armor plate an inch in thickness which an equal quantity of dynamite had been unable to bend. The French authorities announce that Vieille has produced an absolutely stable smokeless powder. Its ballistic qualities are slightly superior to those of the present powder but do not differ enough from the latter to necessitate the least change or modification in either weapons or projectiles.

PETROLEUM. On August 28 occurred the semi-centennial of the sinking of the first petroleum well in the United States. During 1908 the crude oil taken from below the surface in this country amounted to 183,181,084 barrels of 42 gallons each, representing at the wells a value of \$134,000,000. In fifty years petroleum has risen from industrial and commercial non-existence to the fourth place in the natural and manufactured products of the United States. Its volume and value are surpassed only by food-stuffs, cotton, and iron and steel. Although discovery and development of petroleum have progressed elsewhere, nevertheless the United States still furnishes 64 per cent. of the production of the entire world.

MISCELLANEOUS. "Bakelite" is the name of a new compound that chemically is oxybenzyl-methylenglycol anhydride, but for the sake of euphony is called Bakelite, after its inventor. It is a coal-tar product, combining the properties of amber, celluloid, and carbon. It is much cheaper than either celluloid or hard rubber, though not so flexible or elastic. It is valuable for electrical insulation where a high voltage current is used, as it greatly reduces the liability of burning out under overload. Formic acid is finding greater use than formerly. The chemically pure acid is used in small quantities for medical purposes, and also to some extent in the manufacture of fruit essences. Its chief commercial application, however, is in dyeing and tanning, where its corrosive effect is of great value. For dyeing purposes formic acid is substituted in cases in which formerly 30 per cent. acetic acid was used. As a mixture it is preferred to sulphuric acid, because it is harmless to thread and tissue and produces a more equal color effect. In the dye bath it has proved to be a better fixing agent than acetic acid, and it can be used in connection with all kinds of tissue. It gives to mercerized cotton the rustling effect of silk, and it is cheaper than citric or tartaric acid. In the silk trades it is used advantageously to produce the sheen, and

in the printing of cottons it enables the manufacturers to produce a clearer and brighter tone than is obtained by acetic acid. It may be utilized also for dissolving dyestuffs and as an antiseptic in finished materials. A non-inflammable celluloid called "cellite" is now manufactured in Germany by substituting various artificial chemical products similar to the camphor now used in preparing ordinary celluloid. Also from Germany is a new pigment called "vitralin." It is a highly lustrous paint which can be applied to surfaces with the same care as ordinary paints and has remarkable disinfecting properties, hence its use in sick rooms for the purpose of destroying disease germs is recommended. Alcohol may be obtained by exposing sawdust to sulphurous acid gas, by means of which a chemical action is induced which enables the alcohol to be generated without being mixed with or contaminated by the sulphur as was the case when sawdust was macerated in a solution of sulphuric acid by the older processes. It is claimed that wood alcohol made by this new method can be drunk or used for any purpose to which pure alcohol is applied. One metric ton (2204 pounds) of sawdust yields by this process 100 litres or 27.47 gallons of alcohol, 20 kilos (42 pounds) of acetic acid and the residue or spent sawdust is pressed into briquettes and used as fuel. The increasing scarcity of natural fuels has led to the growing use of liquid or *blau* gas, and in Germany it has been employed for lighting trains. It is described as a transportable liquid which is simply evaporated as used, and can be used for lighting, heating, cooking, soldering, and welding purposes. It is claimed that it is non-poisonous and its explosiveness is about three times less than coal gas. This gas is obtained by the dry distillation of raw petroleum and of by-products of the lignite and oil industries. Factories for the production of this gas have been established in New York and in Boston. Water purification by ozone, although successful in Europe, was not put into practical application in America until this year, when in Lindsay, Ontario, a small plant was installed where 1,500,000 gallons a day were purified at initial cost of \$7000 with the expenditure of not more than ten horse-power. The ozone is produced by the action of a high tension electric discharge on the oxygen of the air. The special value of this purification is the destruction of germs. When a bacillus comes in contact with bubble of ozonised air the carbon of its body combines with oxygen and the bacillus is consumed completely. The resulting carbon dioxide partially rises to the surface of the water and passes off into air, and is partially taken up by the water. This gives to it its brightness and pleasant taste. Silundrum or silicified carbon is a product that is obtained when carbon is heated in the vapor of silicon. It is fire-proof, can be heated in the air up to 1600° C. without showing any oxidation. At about 1700° the silicon leaves the carbon and combines with the oxygen of the air. Silundrum cannot be melted. It is used for heating-apparatus for melting metals and for electric muffle or high temperature-ovens for laboratories. A glass has been invented in France that is refractory to the action of acids and opposes to the passage of the electric current a resistance nearly 1000 times smaller than that of ordinary glass. The new glass is used for making the disks of electrometres and electroscopes. In these latter de-

vices thin filaments of the new glass may even be substituted for the usual gold leaves.

CHESS. The international championship chess tournament, held in St. Petersburg, resulted in a tie between Dr. E. Lasker, the world's champion, and A. Rubenstein, the Russian champion. Dr. Lasker easily won his match at Paris with D. Janewski, losing only one game in the contest. The match for the United States championship held at Lexington, Ky., resulted in a victory for F. J. Marshall, who won 7 games from J. W. Showalter, lost 2 and drew 3. The Anglo-American cable match for the Sir George Newnes trophy was won by the British team by a score of 6 games to 4. The collegians, however, fared better in their annual cable match, winning 4½ games and losing 1½. The seventeenth Intercollegiate Tournament was won by Princeton, with 7½ victories and 4½ defeats. Harvard was second and Columbia, the winner in 1908, third. In the tenth Triangular College Chess League Tournament Pennsylvania was an easy victor, losing only one game out of eight. This victory gave Pennsylvania permanent possession of the second Isaac L. Rice trophy, Cornell holding the first one contested for. A feature of the 1909 chess history was the remarkable showing made by José R. Capablanca, the young Cuban champion. He easily defeated the international player, F. J. Marshall, and in an extended tour of the United States he played 720 games, of which 686 resulted in victories.

CHICAGO. See ILLINOIS.

CHICAGO, UNIVERSITY OF. An institution of higher learning, at Chicago, Ill., founded in 1891, by John D. Rockefeller. The number of students for the year July 1, 1908, to June 30, 1909, was 5659. This includes all individuals registered throughout the year, including the summer quarter. In order to make this comparable with other institutions it should be reduced to a basis in which the unit is one individual in residence for nine months. The number thus computed would be 3639. The faculty numbered 330, including 60 assistants. There were 491,481 books in the library. A number of gifts were promised during the year, but none were actually paid in, and according to the rules of the University, are not counted as being made. The most important changes in the faculty during the year were the election of Professor C. H. Judd, formerly of Yale University, to the Headship of the Department of Education and the Director of the College of Education, and the appointment of Professor William A. Nitze, formerly of the University of California, to the Headship of the Department of Romance Languages. The University conducts evening and Saturday courses, non-residence lecture courses and correspondence study. It conducts also an academy for boys, and has close affiliation with 13 other college institutions, academies and seminaries and official coöperation with some 200 high schools in 18 States. The University publishes many volumes yearly and issues fourteen periodicals. The equipment of the University is valued at \$9,000,000. It has an endowment of about \$17,000,000 and its annual income is about \$1,250,000. The president is Harry Judson Pratt.

CHILD LABOR. The fifth annual conference of the National Child Labor Committee was held at Chicago, January 21-23. The conference was attended by a larger number of dele-

gates, from a wider area and more diverse interests, than any preceding it. Prominence was given to the agitation for a Federal Children's Bureau for the investigation of infant mortality, degeneracy, delinquency, orphanage, employment and other factors in child life. The need of modifying the educational system and school laws so as to conserve the child's health and strength and at the same time to secure his greatest development was discussed by such authorities as Dr. Andrew S. Draper and Dr. Woods Hutchinson. The latter said, "Substitute the play, the garden, the shop, for the book school. Fit the child for life and for action instead of for contemplation and culture." A Connecticut manufacturer pointed out that two serious difficulties in child labor reform are the fact that some simple work in factories is intermittent, and not requiring the qualities of a grown person, and the fact that the shortening of hours of child workers upsets the whole organization of a factory, because many children are helpers to grown persons working longer hours. Other important phases of the subject taken up were: Industrial accidents to children; the effect of child labor on future earning powers, a very high probability being established that child workers suffer considerable reduction in such power; child laborers on farms, it being stated that 1,100,000 children are at work on farms for wages; the deleterious effects of posture while at work; the substitution of a physiological test by the Roentgen ray, to determine age for present methods of declaration and certification; the contribution of child labor to child delinquency; and the bad effects of the street trades upon health, morals and future capacities.

A Southern child labor conference met at New Orleans early in April, at the call of Governor Sanders. All the Southern States, except Alabama and Texas, were represented by public officials, manufacturers, labor leaders and child welfare reformers. The report of the resolutions committee, signed by all members, except Jas. W. Van Cleve, president of the National Manufacturers' Association and two other manufacturers, was adopted. It favored the following propositions: That the minimum age of employment be 14 years for all children and 16 years for those who cannot read and write, except in agriculture and domestic service; that no child under 16 be employed in or about mines or quarries or in dangerous trades; that night work be prohibited for boys under 16 and girls under 18; that a 54-hour week is highly desirable; that the registration of births be required, as a step toward efficient enforcement of child labor laws in the future; and that adequate State inspection be provided for. These resolutions set a standard as high as the existing legislation in all but one or two States. Before adjournment a permanent organization was effected, and Memphis, Tennessee, was mentioned as the probable place of meeting in 1910.

An important legal opinion affecting child labor was rendered early in the fall by the Supreme Court of West Virginia. A boy just under fourteen years of age had brought suit for \$8000 damages for the loss of a leg while employed in a coal mine. As the law of that State allows boys of twelve years to be so employed, the decision turned, not on any violation of law, but upon whether a boy of that age has sufficient discretion and experience to comprehend the dangers attending his employment.

The court held that the employer was in this case wholly responsible because he had employed a child at too dangerous a position, had not sufficiently instructed and cautioned him, and had not taken proper precautions to prevent accident. The court did not deem the damages excessive for so severe and permanent an injury.

LEGISLATION. New laws were enacted in 1907 in North Carolina, South Carolina, Florida, Tennessee, Arkansas, and Alabama, and in 1908 in Kentucky, Louisiana, Mississippi and Virginia. Special efforts were made in 1909 to secure better child labor laws in North and South Carolina. In North Carolina the fight was continued during the entire legislative session, the reformers being pitted against a powerful manufacturers' lobby. The purely farcical law requiring manufacturers to report once every six months that the provisions of the child labor law "have been faithfully complied with," was the only enactment secured. A bill limiting work to 64 hours per week for women and children, raising the age limit and restricting night work, passed the House but was defeated in the Senate. The fight in this State was based largely on studies made under the direction of the National Child Labor Committee at Charlotte, in and about which almost one-half of Southern spindles are located. It was found that many children from 7 or 8 years up were working in 12-hour night shifts with no time off for eating. In South Carolina, where any child of 12 years or over and any orphan of any age may work in mills, the only change in the hours of labor was retrogressive. The 60-hour week was retained, but the day limit was raised from 10 to 11 hours. Provision was made for two factory inspectors. Investigation has shown that in South Carolina mill towns the school attendance is practically limited to children under 12 years of age, the average attendance being only about one-fifth that of the State (including negroes).

The Wisconsin Legislature passed a law applying to Milwaukee prohibiting boys under ten and girls under sixteen from selling newspapers or magazines on the street, and prohibiting boys under twelve and girls under sixteen from employment in street trades, in distributing handbills or in offering merchandise for sale. Boys under fourteen can be so employed only during hours when schools are not in session; they must pass through various educational, physical and mental tests, and must wear badges conspicuously displayed. At the same time the Wisconsin Legislature forbade the employment of children in any but legally specified trades; prescribed full and rigorous methods of securing a school permit; restricted the employment of children in theatrical and other public exhibitions; and struck out those provisions of the 1907 law permitting the employment of children at night to save perishable goods or in outdoor work at any time and age.

The Pennsylvania Legislature greatly improved its child labor laws, largely as a result of the action of the Governor in making this an administration policy. The new law prescribes an average ten-hour day and a fifty-eight hour week; provides an efficient regulation and safe-guarding of the granting of age and school certificates; and strikes out the old exception permitting the employment of under-age children because their parents are poor. While the old exemption for the glass industry was retained by a margin of only two votes in the

Senate, the provisions of the new law were extended to the breaker-boys employed in the coal industry.

In New York new laws were passed specifying a list of dangerous occupations for children under sixteen; and strengthening the Commissioner of Labor in the enforcement of the law. Iowa provided the standard proofs of age. Delaware forbade night work for children under sixteen, except in the cannery industry and basket factories; limited hours to a nine-hour day and a 54-hour week; increased the powers of factory inspectors; and provided tests of physical and educational fitness. Michigan extended the prohibition of night work to girls under eighteen; prescribed a 54-hour week for all women and for males under eighteen; and provided more rigid proof of age and ability to read and write English. Kansas, Oklahoma and North Dakota prescribed an eight-hour day and a 48-hour week for boys under sixteen and girls under eighteen; and Rhode Island a 10-hour day and a 56-hour week for all persons under sixteen and for all women. The new law in North Dakota also prohibits night work and employment in dangerous trades and requires standard proofs of age.

GREAT BRITAIN. A monograph prepared by Victor S. Clark on *Women and Child Wage-Earners in Great Britain*, published by the United States Bureau of Labor, reports a very high standard of protection for child workers and mothers, with consequent advantages to home and school life, to earnings, and to physical and moral well-being. In September was published the report of the English Departmental Committee on Partial School Attendance. It dealt with the "half-time" system, a plan whereby boys and girls of ages 12 to 14, who have secured labor certificates, are permitted to work in mills and factories one-half of each week day on condition of attending school the other half. In 1909 there were 34,306 such children, of whom 20,302 were in the cotton mills of the Lancashire district. This is a long-continued system of exploiting the children of the poor, which employers find profitable and to which parental ideas and social habits have become adjusted. Its connection with physical and moral deficiency have been repeatedly pointed out. In December the London County Council educational committee drew up a new set of regulations for children engaged in street trades, prohibiting such employment for boys under 14 and girls under 16, for boys of ages 14 to 16 not excused from school attendance, and between the hours of 9 P. M. and 6 A. M. for boys of ages 14 to 16 who are excused from school attendance. For child labor developments in Germany see WOMEN IN INDUSTRY.

CHILD LABOR COMMITTEE, NATIONAL
See CHILD LABOR.

CHILDREN'S COURTS. See PENOLOGY.

CHILE, OR CHILI. A South American republic extending between the Andes and the Pacific from Peru (the Samu River, 17° 57' S. lat.) to Cape Horn. The capital is Santiago.

AREA, POPULATION, ETC. The estimated area of the 23 provinces and one territory constituting the republic is 292,419 square miles, and the estimated population over 3,870,000. The most densely inhabited provinces are, in the order given: Valparaiso (138.5 to the square mile in 1905), Santiago, Concepción, Nuble, and Colchagua. The principal cities, with population

in 1907, are: Santiago, 378,711 (probably 400,000 in 1909); Valparaiso (the chief port on the western coast of the Continent), 197,580; Concepción, 60,676; Iquique, 44,500; Talca, 44,271; Chillan, 33,000; Antofagasta, 32,219. Immigration has been small, but under the encouragement of the government rose from 1442 in 1906 to 8810 in 1907. See EXPLORATION.

Primary instruction is free, but not compulsory. About 70 per cent. of the adult males, and probably a larger proportion of the females, are illiterate. In 1906 there were 2265 public primary schools, with 160,736 pupils, an average attendance of 101,360, and 4520 teachers. These schools were maintained during the year at a cost of 6,491,454 pesos. The private primary schools numbered 375, with 38,120 pupils. In 1908 there were 15 industrial schools, with 3300 pupils. There are schools and colleges, both public and private, for secondary, higher, technical, and professional education. The state religion is Roman Catholicism, but religious toleration prevails by law.

AGRICULTURE. Of the total area about one-fifth, or 37,065,000 acres, is cultivable land. Large quantities of cereals, besides excellent wine, fruit, and vegetables, are produced annually. Recent estimates place the number of farms at about 50,000, with an assessed valuation of \$365,000,000. In 1908 the wheat yield amounted to about 25,000,000 bushels, and barley 5,500,000 bushels. The wine production of 1908 was about 52,800,000 gallons. Flax cultivation is encouraged by the government. The raising of live-stock is of considerable importance, the development in recent years of sheep raising in the Territory of Magellan being especially notable. Dairy farms and the production of butter and cheese are increasing. See IRRIGATION.

MINING, ETC. Chile owes its material prosperity chiefly to its large mineral resources. The leading mineral products are sodium nitrate, copper, coal, iodine, calcium borate, gold, and silver. The most important of these commercially is nitrate, of which the officially estimated supply still in sight (in Antofagasta and Tarapacá) is over 4,800,000,000 quintals (1 quintal = 101.61 pounds). On account of a disagreement among the nitrate producers, the combination for the control of its production and exportation ceased to exist on March 31, 1909. In 1908 the output of nitrate was 42,847,267 quintals, and of copper, about 35,000 tons of refined metal. The annual production of coal is about 900,000 tons; of borate, about 28,000 tons.

The leading manufacturing establishments are those concerned with the treatment of ores and other minerals, but other factories of various kinds are developing. During 1909 the first steel plant south of Mexico was under construction at Corral. It was expected that this plant, backed by French capital and to cost \$2,000,000, would be ready for operation early in 1910, having a daily capacity of 200 tons.

FOREIGN COMMERCE. The total values of imports and exports in pesos (36.5 cents) have been as follows:

	1906	1907	1908
Imports.....	237,697,642	293,681,855	267,264,169
Exports.....	289,621,397	280,080,730	314,274,093

In 1908 the leading classes of imports were valued as follows: Textiles, 55,828,127 pesos

(nearly half from Great Britain); machinery and mechanical appliances, 53,433,831 (nearly half from Germany); mineral products (exclusive of coal), 46,902,528; fuels (including coal) and oils, 46,850,020; vegetable substances, 46,902,528; animal substances, 18,592,084; paper, cardboard, and their manufactures, 7,961,442; spirits and other beverages, 5,071,394; pharmaceutical and chemical products, 5,433,357. The principal imports showing a decrease, as compared with 1907, were: Textiles, 12,579,543 pesos decrease; mineral products, 11,680,388; vegetable products, 8,656,263; animal products, 2,351,975. Imports showing an increase over 1907 were petroleum, coal, machinery, and paper and paper products. Oils and fuel increased by 5,588,441 pesos, and machinery and mechanical appliances by 5,239,527 pesos.

Export values in 1908 were: Mineral products, 271,459,104 pesos (an increase over 1907 of 29,428,860 pesos); vegetable products, 24,484,189 pesos (an increase of 11,171,755 pesos); animal products, 16,689,180. Of the mineral products the most important were: Sodium nitrate, 44,576,177 quintals, valued at 233,838,000 pesos, (206,202,950 in 1907); copper bullion and bars, 29,539,235 kilos, 17,560,000 pesos; copper ore, 64,684,579 kilos, 7,037,200 pesos; calcium borate, 31,740,650 kilos, 4,443,690 pesos; iodine, 330,090 kilos, 3,928,069 pesos; gold and silver ores, 1,162,913 kilos, 2,532,611 pesos. Great Britain received mineral products valued at 124,340,442 pesos; Germany, 59,530,514; the United States, 43,448,189; and France, 17,107,059.

Imports from countries commercially the most important were valued in pesos as follows in 1907 and 1908:

Countries	1907	1908	Value Per cent.
Great Britain.....	113,502,732	83,920,023	31.40
Germany	74,310,374	75,163,197	28.35
United States	31,124,384	24,385,123	9.12
Australia	7,397,112	17,168,811	6.42
Belgium	10,197,301	12,757,365	4.77
France	16,093,564	11,945,367	4.47
Argentina	10,018,251	10,535,007	3.94
Peru	8,795,298	10,213,863	3.82

Exports to the principal countries were valued in pesos:

Countries	1907	1908	Value Per cent.
Great Britain.....	139,666,884	149,355,719	47.52
Germany	55,819,019	67,595,074	21.50
United States	24,843,462	44,063,669	14.02
France	16,224,086	19,114,971	6.08
Belgium	3,724,218	8,657,584	2.75
Netherlands	11,562,645	7,140,566	2.27
Portugal	9,735,775	3,438,136	1.09
Peru	2,820,653	3,431,874	1.09

In the first six months of 1909 there was a decline in both imports and exports, the total trade being about 16 per cent. less than during the corresponding period of 1908.

COMMUNICATIONS. For 1907 the length of Chilean railways was reported at 3289 miles, of which the government owned and operated 1543 miles and private companies 1746 miles. In 1908, 648 miles of government railway were constructed. In 1909 the government had under actual construction 16 lines (or parts of lines), aggregating 619 miles, to cost when

completed upwards of \$25,000,000. Chile's great railway undertaking is the Longitudinal Railway, to extend from Arica south to Puerto Montt, a distance of 2138 miles. Over half of this line is in operation, and construction on the remainder is progressing as rapidly as possible. Also under construction of the Chilean government is one line from Arica to La Paz, Bolivia (337 miles, 186 miles in Bolivian territory). According to a contract awarded on May 1, 1909, to a British firm for the completion of this line, the Chilean section is to be finished within 30 months from that date at a cost of £1,845,000 and the Bolivian section within three years at a cost of £1,105,000. It was expected in 1909 that the Transandine Railway (888 miles from Valparaiso to Buenos Ayres, Argentina), including the Transandine tunnel (which was completed on November 27), would be open to traffic over its entire length before the middle of 1910. There are over 12,000 miles of telegraph lines.

FINANCE. Revenue is derived mainly from export duties on nitrate, import duties, and the railways. For 1908 the estimated revenue was 224,000,000 pesos paper (the paper peso is worth about 20 cents), and the estimated expenditure was 65,230,892 pesos gold (36.5 cents each) and 157,715,666 pesos paper. Export duties in 1908 amounted to 6,888,431 pesos gold and 6,079,581 pesos paper; import duties, 19,859 pesos gold and 5,895,404 pesos paper. For 1909 the estimated expenditure was 73,171,889 pesos gold, and 175,084,404 pesos paper; the largest items were for the following departments: Industry and public works, 29,256,786 pesos gold and 46,937,293 pesos paper; treasury, 19,187,970 gold and 16,801,933 paper; navy, 14,845,224 gold and 14,905,391 paper; interior, 5,994,667 gold and 34,281,052 paper; war, 1,677,134 gold and 26,113,586 paper; public instruction, 342,446 gold and 24,508,169 paper. On June 1, 1909, the external debt stood at \$101,900,000. The government is accumulating gold for the purpose of gradually exchanging the paper currency for new legal tender at full value. There is no state bank. On December 31, 1907, the 24 joint-stock banks of issue had assets amounting to 811,363,263 pesos.

NAVY. In 1909 the effective navy included 3 armored battleships, aggregating 19,000 tons; 1 armored cruiser, of 7000 tons; 4 protected cruisers, aggregating 14,500 tons; 4 torpedo gunboats, aggregating 1470 tons; 7 torpedo-boat destroyers, 2270 tons; 5 first-class torpedo boats, 728 tons. There were also 1 monitor, of 1822 tons; 1 school ship of 2330 tons; 4 transports and 6 vedettes. The government's naval programme as announced in October included one 20,000 ton battleship, two destroyers, and several submarines, and involved an expenditure of about \$20,000,000.

ARMY. All able-bodied citizens are liable to service in the army, which consists of an organized or active army in four divisions distributed territorially for mobilization, and each comprising the three arms of the service. In 1909 there were 16 regiments of infantry, 6 regiments of cavalry, 1 section of machine guns, 3 regiments of field artillery (each with 3 batteries and 1 battery of horse artillery), 2 regiments of mountain artillery each of 4 batteries, 1 battalion of railway troops, 4 companies of sappers and miners, and 4 companies of train. On the active list in 1909 there were 4 major-

generals, 8 brigadier-generals, 20 colonels, 40 lieutenant colonels, 80 majors, 200 captains, 250 lieutenants, and 98 sub-lieutenants. The skeleton organization maintained comprised 6600 men and the annual contingent of recruits was 6882 men. So that a field army of about 50,000 could be put out on mobilization. In the reserves there were 900 lieutenants and recruits who received military training annually. The war strength was estimated at 150,000, which included a part of the national guard, while with others who have received but little training this could be raised possibly to 350,000.

GOVERNMENT. The executive authority is vested in a president, who is elected by indirect vote for a term of five years and is assisted by a responsible council of state and a responsible ministry. The President in 1909 was Pedro Montt, who assumed office September 18, 1906. The legislative power devolves upon a congress of two houses, the Senate (32 members, elected for six years) and the Chamber of Deputies (94 members, elected for three years). The provinces are administered by intendentes, appointed by the President.

HISTORY. The chancellor of the German legation at Santiago was tried for a sensational crime. The building of the legation had been burned, all the archives stolen, and the body of the porter found in the ruins. The chancellor was tried for murder, falsification of accounts and on other charges, and early in September was found guilty and sentenced to death.

In April it was announced that the Arica-La Paz Railway contract was awarded to a British company, £3,000,000 being voted. In August the government resigned, owing to the President's opposition to the bill deferring the operation of the Metallic Conversion Law, which had passed both houses.

The dispute with Peru as to the possession of Tacna and Arica still continued. It was decided in 1908 that the question should be settled by plebiscite, but there was a difference between the two countries as to who should have the right to vote, the Peruvian government contending that the plebiscite should be rendered only by the native inhabitants of the two provinces, and the Chilean government insisting that the Chilean colonists in the provinces should also have the right to vote. Tacna and Arica were conquered by Chile and have been held since October 20, 1883. The greater part of the natives were Peruvians and the greater part of the newcomers were Chileans, hence the settlement of the matter was difficult. See PERU.

The completion of the Transandine tunnels was celebrated on November 27. The main tunnel of the Transandine Railway, connecting the capitals of Argentine and Chile, is five miles long, and has a greater altitude than any other tunnel at the present time. In the latter part of the year the Alsop claim was referred to the arbitration of King Edward of Great Britain. This dispute dated back nearly forty years, in the course of which there had been repeated negotiations. It arose from the claims of certain American citizens engaged in business with the governments of Chile, Peru and Bolivia. After the war of 1881 between these three countries, the territory in which the claims occurred passed into the possession of Chile, and a formal demand on the Chilean

government was made for settlement. See ARBITRATION, INTERNATIONAL.

CHINESE EMPIRE. A monarchy of eastern Asia, extending from Siberia on the north to French Indo-China and British India on the south. The capital is Peking.

AREA AND POPULATION. The area in square miles, and the population of the empire, are stated as follows (the first column for population is according to the Chinese estimate of 1902; the second, according to other estimates accepted by many as more nearly approximating accuracy):

	Area	Population	Population
China proper.....	1,532,420	407,253,030	320,500,000
Manchuria	360,610	16,000,000	5,530,000
Mongolia	1,367,600	2,600,000	1,850,000
Tibet	463,200	6,500,000	2,250,000
Chinese Turkestan, etc.	550,340	1,200,000
Total	4,274,170	433,553,030	330,130,000

In 1904 the American Minister at Peking, after careful inquiry, estimated the population of China proper (the eighteen provinces) at less than 270,000,000; in 1906 the Chinese Imperial Customs estimated the total population at 438,214,000. So much doubt exists as to the actual number of people in the empire that in 1909 the government decided to take a new census, the complete returns of which will probably not be available before 1912. According to the results of Chinese official investigation, the number of Chinese in foreign countries is 6,800,000, mostly in Siam, Java, Malaysia, and neighboring countries. In 1908 the number of foreigners living in the treaty ports was 77,960, including 44,143 Japanese, 9,620 Russians, 9,043 British, 3,637 Germans, 3,545 Americans, 3,353 Portuguese, and 2,029 French. Native adherents of religions properly foreign to China include about 30,000,000 Mohammedans, 1,000,000 Roman Catholics, and 150,000 Protestants. The population of Peking is estimated at from 500,000 to 1,650,000; a census taken in 1908 gives 128,008 families, according to which, on the basis of 5.5 to a family, the inhabitants would number 704,044. The population of other cities is likewise very uncertain. Figures given for the native population of the larger treaty ports are as follows: Canton, 900,000; Hankow, 820,000; Tientsin, 800,000; Shanghai, 651,000; Foochow, 654,000; Chungking, 610,000; Soochow, 500,000; Hang-chow, 350,000; Nanking, 267,000; Changsha, 230,000; Chinkiang, 182,000; Wuhu, 128,000; Amoy, 114,000; Chefoo, 100,000.

EDUCATION. There are now three classes of schools in China—the old-style schools, the mission schools, and the institutions which are being established by the government pursuant to the Imperial decree of September 3, 1905. The number of the old-style schools, which are private institutions, is beyond computation, practically every village and hamlet having one or more. Their curriculum is practically confined to the Chinese classics, examination in which, for state employment, was abolished by the above-mentioned decree. Nevertheless, it will probably be a long time before a large number of the old-time schools are superseded by modern institutions. The various missions have opened schools in all the Chinese provinces,

from primary to collegiate rank. In 1907 the reported number of mission primary schools was 2196, with 42,546 pupils, and of mission intermediate schools, high schools, and colleges, 389, with 15,137 pupils. The decree of September 3, 1905, provides for the establishment of an elaborate system of education, modeled on that of Japan. Schools of all grades, with Western curricula, are to be established in every province. Already schools and colleges have been opened in many places in substantial buildings of Western style of architecture. In 1909 the greatest difficulty encountered by the government in carrying out the new plan was the lack of properly qualified teachers. The Imperial University at Peking is a government institution, where Western science and languages are taught by European and Japanese professors, and Chinese subjects by Chinese. A medical college was established at Peking in 1906. At Tientsin there are a Chinese university, an Anglo-Chinese college, an industrial school, and medical schools. Canton has a college of foreign languages, an agricultural school, a law school, etc. Nanking has a military and naval college, government middle schools, and a normal school. In recent years the government has undertaken to reorganize military instruction, and it has established schools in connection with various arsenals.

INDUSTRIES. Agriculture is the leading industry. In the north the principal crops are wheat, barley, corn, millet, and other cereals, and beans and peas; in the south, rice, sugar, indigo, and cotton. Tea and silk cocoons are important products, the former being produced in the west and south, and the latter in every province. Large amounts of opium have been produced, but, pursuant to government decree, the output is being greatly restricted. The rainfall is uncertain, and almost every year various parts of the country suffer from flood or drought. In the midsummer of 1909 the drought was so severe in Shantung that the Governor prohibited the export of grain, and a few weeks later most of China north of the Yangtse suffered from flood, enormous damage being done to the crops. The production of tea (especially black leaf), which suffered in competition with the teas of Ceylon and India, has increased in recent years. The culture of silk, though not at present in a prosperous condition, is more important than that of tea; about 27 per cent. of the world's supply of raw silk comes from China (28 per cent. from Japan and 25 per cent. from Italy).

China is rich in mineral resources, but their exploitation is comparatively insignificant. The minerals which are worked to a greater or less degree include coal, iron, antimony, lead, tin, zinc, salt, and copper. At present the most important mineral exploitation is that of coal, which is widely distributed and is especially abundant and valuable in Chili and Shansi. The coal output in 1906 was estimated at 9,032,660 tons. Next in importance are tin and iron; the export value of the former in 1906 was £530,891.

Manufacturing, in the Western sense, has not reached a high state of development, but the modern textile industry is constantly developing in various parts of the country. Cheap cotton cloths are manufactured in considerable quantity, the number of spindles in operation in 1909 being about 750,000. Other manufac-

tures include iron and steel, thread, yarn, knit goods, flour, and cement.

FOREIGN COMMERCE. Imports and exports (special trade) have been valued as follows, in Haikwan taels (the Haikwan tael was worth 65.5 cents on July 1, 1908, and 63.4 cents on July 1, 1909):

	1906	1907	1908
Imports.....	410,270,082	416,401,369	394,505,478
Exports.....	236,456,739	264,380,697	276,660,408

The principal articles of imports in 1907 and 1908 respectively, were valued as follows, in Haikwan taels:

Articles of import	1907	1908
Cotton goods	118,915,923	110,898,000
Opium	28,653,653	34,226,000
Kerosene	20,203,177	27,326,000
Rice	34,417,307	26,579,000
Sugar	26,358,849	19,801,000
Railway materials, etc.		12,894,000
Coal and coke	7,668,599	8,436,000
Fish, etc.	8,352,907	7,712,000
Dyes and color		7,072,000
Iron		6,977,000
Flour		6,931,000
Tobacco		6,930,000
Machinery		6,846,000
Wood		6,429,000
Copper		6,338,000
Matches		5,158,000
Woolen goods	6,898,806	4,340,000
Tin		4,268,000

The leading exports in 1907 and 1908 respectively were valued as follows, in Haikwan taels:

Articles of export	1907	1908
Silk, raw and manufactured.....	83,084,034	85,709,000
Tea	31,736,011	32,891,000
Beans and bean-cake	12,389,817	23,562,000
Hides and skins	11,116,792	12,074,000
Cotton, raw	17,117,873	10,516,000
Sesame		9,138,000
Straw braid, etc.	6,819,092	7,518,000
Oil		5,481,000
Wool		4,490,000
Tin		4,483,000
Cattle		4,225,000
Straw mat, etc.		3,580,000
Paper	3,376,964	3,439,000

Imports (including re-exports) by countries in 1907 and 1908 respectively were valued as follows, in Haikwan taels:

Countries	1907	1908
Hongkong	155,642,016	150,252,000
Great Britain	77,562,700	72,561,000
Japan	57,461,410	62,501,000
United States	36,903,476	41,246,000
British India	32,913,847	30,499,000
Germany	16,177,400	14,039,000
Russia	913,351	8,652,000
Belgium	10,581,048	8,450,000
Macao		5,822,000
Straits Settlements and Singapore	5,347,638	5,418,000
France	3,158,626	2,403,000
Korea		1,320,000
British America	1,130,374	1,203,000
Italy		509,000
Other countries	30,371,244	14,680,000
Total	429,071,662	409,555,000
Re-exports	12,670,293	15,050,000
Net total	416,401,369	394,505,000

Domestic exports by countries in 1907 and 1908 respectively were valued as follows, in Haikwan taels:

Countries	1907	1908
Hongkong	97,226,434	92,108,000
Japan	39,347,476	37,120,000
France	30,658,585	32,129,000
Russia	17,201,208	29,559,000
United States	26,597,660	23,824,000
Great Britain	12,107,645	12,655,000
Italy		9,849,000
Germany	6,109,195	7,094,000
Macao		4,418,000
Belgium	3,978,652	4,388,000
British India	3,179,695	4,090,000
Straits Settlements and Singapore	4,059,515	3,786,000
Korea		2,595,000
British America	701,468	1,148,000
Other countries	22,958,119	11,996,000
Total	264,380,697	276,660,000

The trade of Hongkong and Macao, listed in the foregoing tables, is chiefly transit.

The value of China's leading import—cotton goods—have fallen off in the last few years. The importation of the principal makes of plain cottons—British, American, Japanese, and Indian—has been as follows:

	1905	1906	1907	1908
	Pieces	Pieces	Pieces	Pieces
British...	13,548,000	10,785,000	8,224,000	8,998,000
American	12,566,000	8,544,000	578,000	1,587,000
Japanese	780,000	733,000	840,000	986,000
Indian...	650,000	85,000	67,000	141,000

Import values of cotton goods in 1907 and 1908 were as follows (reductions from Haikwan taels to American currency were made at the rate of 79 cents for the 1907 figures and 65 cents for the 1908 figures):

Year	Total imports	Re-exports	Net imports
1907.....	\$99,092,524	\$5,148,884	\$93,943,640
1908.....	75,836,212	3,752,512	72,083,700
Decrease....	\$23,256,312	\$1,396,372	\$21,859,940

The following table shows the principal cotton manufactures imported in 1907 and 1908:

	1907	1908
Yarn	\$45,396,955	\$29,442,400
Shirtings of all kinds	17,721,944	17,935,190
Lastings	15,944,018	10,249,200
Drills, etc.	2,150,351	2,512,250
Sheetings	2,895,259	2,231,450
Jeans	1,156,386	2,005,900
T-Cloth	1,623,690	1,424,510
Flannel	1,042,351	1,238,250
Chintzes, etc.	1,332,890	576,550
Thread	608,094	569,400
Towels	624,990	377,000
Cambrics, lawns, etc.	208,489	168,090
Handkerchiefs	192,270	133,705
Blankets	244,804	97,745
All other	2,801,155	3,124,060
Total	\$93,943,640	\$72,083,700

The unprecedented fall in the values of American cotton goods imports in 1907, as compared with 1905 and 1906, found slight compensation in the increased importations of 1908. American trade with China is suffering from

the very active competition of the English and Germans.

SHIPPING. In 1907 the number of vessels, both steam and sail, which entered and which cleared at the treaty ports was 217,932, aggregating 80,109,424 tons; in 1908, 207,605 vessels, aggregating 83,991,289 tons. Of the latter, steamers numbered 86,600, of 77,955,525 tons, and sailing vessels, 121,005, of 6,035,764 tons. Chinese junks comprised the greater part of the sailing vessels. By principal nationalities the shipping entered and cleared in 1908 was:

	Vessels	Tons
British	28,445	34,405,761
Japanese	30,708	18,065,138
German	5,496	6,585,671
French	3,901	5,071,689
Other foreign	2,392	2,927,170
Total foreign	70,942	67,045,429
Chinese	136,663	16,945,860
Total	207,605	83,991,289

The Chinese merchant marine, as reported in 1909, consists of 43 steamers of 41,647 tons, and 3 sailing vessels of 901 tons.

COMMUNICATIONS. Chinese roads are numerous, but generally in a poor state of repair. More important commercially are the rivers and canals, by means of which native junks carry on an enormous amount of traffic. At river ports in 1907 there were registered 864 steamers for inland water traffic; of these, 600 were under the Chinese flag, and 255 were foreign.

At the end of 1909 about 4700 miles of railway, including the Manchurian lines, were open to traffic; many miles were under construction, and projected. The lines in operation in 1909 were as follows: Chinese Eastern Railway Company (Manchurian Railways): (a) Manchurian frontier via Harbin to Dairen and Port Arthur, 1180 miles, with 157 miles of branch lines (Russian and Japanese); (b) Harbin to Pogranichnaia, on the East Manchurian frontier, 462 miles (Russian). Imperial Railways of North China (British engineers; mortgaged in part to British bondholders): (a) Peking to Mukden, 572 miles; branch from Peking to Tungchow, 12 miles; (b) (Chinese) Peking to Kalgan, 137 miles (opened October 2, 1909); (c) Peking to Hankow (Peihau Railway), 754 miles, with branches from Ching-chow to Kaifeng-fu, 35 miles, Kaifeng-fu to Honan-fu, (Belgian capital and engineers), 120 miles, Chengting-fu to Taiyuan-fu (Russo-Chinese Bank), 170 miles; (d) Chinchou-fu to the Nanpiao coal mines, 30 miles; (e) Kao-po-tien (on the Peihau line) to Hsiling Western Tombs, 30 miles. Imperial Shantung Railway Company (Tsingtao-Chinan-fu Railway; German capital and engineers); Tsingtao to Chinan-fu, 247 miles with a branch to Poshan, 30 miles. Peking Syndicate Railway (British capital and engineers); Taok'om (Honan) to Ching-hau (Shansi), 90 miles, crossing the Peihau line. Shanghai to Nanking, 192 miles; Shanghai to Wusung, 12 miles. Canton-Samshui Railway, 30 miles. Pingriang to the Siang River (Chinese) 56 miles. Swatow to Chaochou-fu (Chinese), 32 miles. Peking to Mantokow, 17 miles. Sunning Railway, 40 miles.

The following lines were under construction in 1909: Canton to Wuchang (Hankow), 620 miles; about 65 miles open (Chinese). Canton to Kowloon, 102 miles, to be open by May, 1910 (British). Tientsin to Pukow (Nanking), upwards of 600 miles, begun January 3, 1909 (Anglo-German). Shanghai to Ningpo, 238 miles; about 109 miles completed (Chinese capital and engineers). Extensions of the Sunning Railway to Kong Moon, 26 miles, and to Samkahoi, 59 miles. Amoy to Changchow, 30 miles. Wuhu to Kwangchow, 90 miles. Shanghai to Kashin, Hangchow to Shanghai, Nanchang to Kiukiang-Laokai on the frontier of French Indo-China, to Yunnan-fu, about 296 miles; will probably be completed early in 1910 (French).

The telegraph is being rapidly extended throughout the empire. Telegraphic communication exists between all of the principal cities and with all of the neighboring countries. The total length of line in 1907 was 25,913 miles, and of wire, 39,196 miles. In the last half dozen years the Chinese postal system has shown unprecedented expansion; in 1908 there were 3493 post-offices, and the postal routes covered 88,000 miles. In 1907 the number of postal articles handled was about 167,000,000, exclusive of 1,917,000 parcels; in 1908, 260,042,000 postal articles, exclusive of 2,455,000 parcels.

FINANCE. No comprehensive statements of revenue and expenditure are officially published. The revenue, except the foreign maritime and a few native customs, is collected by provincial agents, and doubtless a large part of the levies remains with the collectors. An unofficial estimate, in 1901, placed the revenue and expenditure at 88,200,000 and 101,120,000 Haikwan taels respectively. An estimate in 1908 placed the revenue at 105,000,000 Haikwan taels. Receipts from maritime customs in 1907 amounted to 33,861,346 Haikwan taels (customs, 29,490,469; opium likin, 4,370,877); in 1908, 32,901,895 Haikwan taels (import duties, 18,134,509; export duties, 10,988,485; coasting trade, 1,856,605; tonnage, 1,264,915; transit, 1,790,956; opium likin, 3,871,422). Of the maritime customs receipts in the latter year, 26,309,014 Haikwan taels were derived from foreign commerce, 6,592,681 from internal. The public debt on March 2, 1908, stood as follows: £38,839,600 (\$189,012,913); 499,978,000 francs (\$96,495,754); 452,653,000 Haikwan taels (\$294,224,450); total, \$579,733,017.

MONEY. The only official coinage of China has been the copper cash, of which about 1220 are equivalent to the Haikwan tael. The latter is the unit used by the maritime customs and fluctuates in value with the price of silver, being worth 65.5 cents on July 1, 1908, 60.9 cents on January 1, 1909, and 63.4 cents on July 1, 1909. Recently the provincial mints have issued enormous numbers of a coin known as the "hundredth of a dollar"; it is rapidly displacing the old copper cash and is current at a little more than its intrinsic value, about .24 of a cent, though its face value is about .6 of a cent. A silver dollar, equivalent to the Mexican dollar (which for many years was current at the coast and river ports and their vicinity), is current in all the provinces, and its circulation is extending. An Imperial decree of October 5, 1908 commanded the introduction of a uniform national currency, of which the unit

should be a silver tael coin, of 98 fineness, weighing one k'up'ing, or treasury-scale tael or ounce; its weight was fixed at 575.82 grains (Haikwan tael 581.47 grains).

NAVY. In 1909 the navy consisted of 2 second-class cruisers (4300 tons), 11 third-class cruisers (875-2500 tons), 3 torpedo-gunboats (349-1000 tons), 4 gunboats (215-411 tons), 32 first-class torpedo-boats, and 12 second-class torpedo-boats. Most of these vessels were launched between 1885 and 1902 and many are now unfit for action. The government has in contemplation the creation of an effective modern navy; an Imperial edict of February 19, 1909, ordered the formation of a naval board to devise plans.

ARMY. The reorganization of the Chinese national army proceeded during 1909 in accordance with the general provisions of the law of 1905. By an edict of July 15, 1909, the Emperor assumed supreme command of the army and navy, which was placed under the direction of the Prince Regent, and a military council or general staff of the army was formed. The Chinese army is formed, for the most part, by voluntary enlistment of selected recruits, the time to serve being three years in the active army, three years in the reserve, and four years in the landwehr. The organization, which was to be completed in 1912, would consist of 37 divisions, aggregating 28,000 officers and 430,000 men (380,000 combatants). Each division includes all branches of troops and numbers on a peace basis some 11,000 or 12,000 men, 2000 horses and mules, and 54 guns. In time of war this number can be increased to 17,000, the quota of infantry being doubled from the reserve. In 1909 it was reported that 13 of these divisions had been organized, and had a total strength of 6000 officers and 190,000 men. Each division consists of two brigades of infantry (each of two regiments of three battalions of four companies), 1 regiment of cavalry of 3 squadrons, 1 regiment of artillery divided into 3 sections of 3 6-gun batteries, 1 battalion of engineers, and 1 battalion of train. The training of the new army was being directed by Japanese officers, and each year a number of men were sent to Japan for instruction. Military schools for officers are maintained in the different provinces, and in addition to these cadet schools, four secondary military schools were founded in 1909 at Pekin, Woutchang, Nanking, and Hsi-nan-fou. These schools were turning out well-trained officers and foreign military observers noted considerable improvement, especially in the divisions or brigades quartered near the capitals.

GOVERNMENT. China's form of government has been regarded as that of an absolute monarchy. In practice, however, the sovereign's power is limited or modified by advisory bodies, as the Grand Council and the Government Council, and by the powerful provincial viceroys. A radical departure from absolutism was the Imperial edict of August 27, 1908, which promised a constitution and parliamentary government in 1917. The Emperor encouraged deliberative provincial assemblies for their educative value, and the meeting of these assemblies in October, 1909, was the beginning of what promised to be constitutional government in China. On August 14, 1908, the Emperor Kwang-Hsu died and his death was followed by that of the Dowager Empress. The Emperor in 1909 was

Pu-Yi, who was born in 1906, and succeeded Kwang-Hsu in November, 1908. The Regent was Prince Chun, the Emperor's father.

HISTORY

OPIUM QUESTION. The International Opium Commission assembled at Shanghai on February 1. Its president was Viceroy Tuan-Fang, who declared that the area under poppy cultivation had been already much reduced and that consumption had been cut down one-half. The Commission later chose as its president Bishop Brent, an American. On February 19 the Commission adjourned. Among the important decisions were the following: That each national delegation was to recommend to its government an inquiry into the means of curing the opium habit without recourse to other drugs and into the general medical aspects of the opium question; that the Chinese government was sincere in its policy of suppression and had made progress; that each country should control the trade in morphine, etc., and prevent its shipment to the countries excluding opium; should endeavor to suppress opium smuggling, and should gradually suppress opium-smoking in its own domains and close opium dens in its own settlements, and in the Chinese concessions. The report of the Commission was published in August. Owing to the absence of trustworthy figures, the actual poppy acreage could not be ascertained. The statistics called for by the Chinese Imperial Decree of 1907 had not been supplied. The Chinese delegates promised to bring this matter to the attention of their government.

DISPUTE WITH JAPAN. Several questions were pending between China and Japan in the beginning of the year and threatened to embroil the two governments. Negotiations in regard to them took place from time to time after December 27, 1908. The chief questions concerned the Fa-Ku-Men Railway and Japan's proposed reconstruction of the Antung-Mukden line. According to the Portsmouth agreement Japan was not to hinder in any way the Chinese development of Manchuria. China, which had planned the railway from Fa-Ku-Men, had awarded the construction contract to a British firm (November 8, 1907). The line was to run to Hsin-min-tun. Japan objected to it as a competitive line and likely to injure the Japanese South Manchurian Railway. On the other hand, it was denied in China that the line could be regarded as a competitor. This view was also expressed on November 18, 1908, by the Manchurian Commissioner of Customs, an Englishman. As to the Antung-Mukden line, which Japan had used during the war with Russia and which she was holding under certain conditions defined in the Treaty of Pekin (1905), China was opposed to Japan's scheme of reconstruction and extension. (See JAPAN, paragraphs on History.) Other questions pertained to the collieries, and to the status of Chien-tao. The last concerned a claim on the part of Japan that this territory was Korean and had been illegally occupied by China, and that even if Chinese sovereignty were recognized, Japan must have jurisdiction over the Korean element in the population, which was four-fifths of the total. China on her side produced evidence that Koreans had been permitted by her to occupy this territory only on condi-

tion that they surrender their nationality. The territory was as large as an ordinary Chinese province, and this question ranked next in importance to those of the Fa-Ku-Men and Antung Railways among the issues between the two countries. China proposed a reference of the Manchurian railway question to The Hague. This was refused by Japan on the ground that the Hague Convention confined arbitration to cases in which diplomatic means had been exhausted and that this was not true of the present case. On August 6 Japan issued an official communication blaming China for her delay and accusing her of an unreasonable attitude in the matter of the Antung line. To this China replied on August 11 with an appeal to the text of the Treaty of Pekin in proof of Japan's violation of its conditions. Nevertheless China indicated a willingness to give way to Japan's demands, in the Antung dispute, and in the following month agreed to a compromise on the other points in dispute. China regained control of the Chien-tao territory, but on the other hand agreed not to build a railway near or parallel to the Southern Manchurian Railway and not to build the line between Fa-Ku-Men and Hsin-min-tun without first consulting Japan. The September agreement between China and Japan as to the Manchurian railways was interpreted as meaning virtual withdrawal from Manchuria, whose railways were thenceforth to be controlled by the Japanese. China practically agrees not to build any railways in Manchuria. Japan's railways when completed will reach into the heart of the country. One will connect Port Arthur in Dalny with Mukden, and the other will traverse Korea. For further details, see JAPAN, paragraphs on *History*.

DIFICULTY WITH RUSSIA. The Russian policy in Manchuria was condemned in China as virtually placing under Russian jurisdiction those parts of Manchuria for which it made regulations and on which it levied taxes. On February 21 the Russian authorities in the railway zone west of Kharbin closed the Chinese stores and warehouses at the chief points because their owners would not pay the taxes levied by the railway officials. On May 11 a convention between the two countries was signed for the joint administration of the railway zone and recognizing the sovereignty of China. The United States and Austria-Hungary objected to this preliminary agreement, holding that the Treaty Powers alone could originate laws affecting the right of residence in the international settlements in Chinese territory. Great Britain on the other hand approved if the regulations were framed with the advice of the British consuls. The ratification was checked by these protests. On December 14 the representatives of Russia and China began a conference at Kharbin for a settlement of the Manchurian questions. A question also arose as to the navigation of the Amur River. The Russian Minister declared in August that the Chinese custom house at Aigun, which had recently been put into operation, was a violation of the treaties of Aigun and St. Petersburg.

RAILWAY AFFAIRS. There were frequent complaints during the year of the Chinese attitude toward railways in which British capital was invested. For example, the control and construction of the Shanghai-Hang-chau-Ning-po line, to which British investors had lent £1,

500,000, were vested in the Chinese Imperial government and a British engineer was to take charge. It was reported on February 17, however, that the conditions of this agreement were violated, that the funds were squandered, that the authority of the British engineer was disregarded and that the railway showed every possible defect. Later this work on the line was reported to be at a standstill. The British engineers were unable to go on with the work or to collect any payment for what had been done. The inefficiency of the central government was blamed for this state of affairs. In March it was announced that the German Asiatic Bank's overtures for a loan of \$15,000,000 to China for the Canton-Hankow line was causing opposition on the part of France and Great Britain. Complaints that the Chinese managing director was obstructing the British section of the Tien-tsin-Yang-tze Railway led Chinese authorities to promise an investigation. A conference between the British, French, and German financiers as to this loan was fruitless. It was then reported that the Germans had received a special concession, that the British legation had protested and the Chinese government was hesitating. Later, however, an agreement was announced between the bankers of the three nations, whereby the Germans withdrew all claims as to the Hankow-Canton line, and the British withdrew all claims to the Hankow-Szechuen line. This caused some criticism in England as allowing an extension of German influence. On May 15 it was agreed that the Germans should have the appointment of the chief engineer for the Hankow-Chang-tu line and the British for the Canton-Hankow line. On June 5 negotiations were completed for a loan of £5,500,000 for railway building in Hu-pea and Hunan, the loan to be equally divided between the British, French and German bankers. Soon afterwards the United States representative protested against the ratification of this loan agreement on the ground that China was bound to apply first for American capital on the Hankow-Szechuen line if any foreign loan were needed. In consequence of this claim the Chinese government deferred ratification. On August 17 the Hankow railway loan question was reported as settled on the following basis: The amount of the loan was raised to about \$30,000,000, of which three-fourths was to be divided among the British, French and German groups and one-fourth was to be subscribed by American capitalists. The curt reply of the British group of financiers in the spring to the original American proposal for coöperation in this loan led to reports of ill-feeling and some discussion in the newspapers. The American proposal was approved by the United States Minister and favorably regarded both by the French and British interests before it was submitted to the British corporation, but the British government had no knowledge of the American government's interest in the matter. The Chinese were dilatory and the delay was attributed in the United States to the opposition of the British financial group which was supposed to be supported by the British government. The Pekin-Kalgan line was opened in October.

POLITICAL CONDITIONS. The dismissal of Yuan Shih-Kai, Viceroy of Chi-li from all his offices on January 3 was greatly deplored by the foreign representatives, and there was frequent reference during the year to the need of

his high administrative abilities. Liang-Tun-yen, a Yale graduate, was appointed to succeed him as assistant president of the Wai-wu-pu. In February there were reports of a scandal in the Board of Communications. Charges of official inefficiency and corruption were made and the president of the Board, Chen-pi, was cashiered. Under the regency there were signs of weakness in the central administration and reports of palace intrigues. The reforms promised by the government were either not introduced or were very ineffectively carried out. Under the decree providing for a uniform system of weights and measures, there was devised a very cumbersome system which apparently would lead to sinecures and monopolies. Although there had been benefit from the abolition of classical examination and from the restriction of opium-smoking, the mandarins in general were opposed to all changes and the only hope seemed to be in the awakened interest of the people, especially of the intelligent and well-to-do. There were complaints in the summer from among the foreign residents that the former evils of inefficient administration again marked the Wai-wu-pu and for this the president, Prince Ching, was chiefly blamed. It was charged that he was corrupt and negligent, seldom visiting the office or holding communication with the foreign ambassadors, and there were complaints of a lack of consideration for the foreign representatives. It was said that the Prince Regent did not take a sufficiently serious view of the importance of the foreign office. Serious obstacles to reform were the unsatisfactory relations between the central and the provincial governments and the cumbersome financial system of the empire. Sir Robert Hart, commenting on the financial system, for example, declared that the land tax, which yielded only 25,000,000 taels, ought, if levied in the same way as in India, to yield 400,000,000 taels a year, but he said that improvement was practically impossible on account of official corruption. There was no assurance that any new system would prevent the money from finding its way into official hands. The prospect for any thorough financial reform was not favorable. In April a new citizenship law went into effect forbidding under heavy penalties any native Chinaman to become a nationalized citizen of another country.

On October 14 the new provincial assemblies met as ordered by the Imperial Decrees of October 19, 1907, and July 22, 1908, the elections having been going on for some time past. There was a provincial assembly for each of the twenty-two provinces and for Manchuria and the New Dominion. The halls of assembly were situated at the seat of the governor or viceroy. The functions of these assemblies were purely deliberative. An Imperial decree was issued on October 15 advising the governors and viceroys as to their duties of supervision and repeating the advice given in previous decrees as to the deliberation of the new bodies. This was an important step in the carrying out of the programme of constitutional preparation. By the Imperial edict of September, 1907, a council of government was established, to be known as the Department of Constitutional Study, and Investigation (Chih Cheng Yuan), and to form the nucleus eventually of an upper house of parliament. Its function consists in advising the central government as to the fundamental laws

which it thinks desirable. The provincial bodies were to perform a similar office for the provincial governments. The decree creating them contains the following passage: "The consultative council is an institution in which public opinion will be ascertained and for which the members of the central council may be recruited. Let our people point out clearly through the councils what are the evils that should be abolished in their respective provinces and what are the reforms that they desire. But let them also remember the duty which they owe to the court and to the country. Violent discussion should be prevented, lest the order and safety of society might be disturbed." The qualifications of the electorate were experience in public office, or the possession of a high school diploma or the ownership of property valued at \$5000 in silver. By the decree of August 27, 1908, it will be remembered, the grant of a constitution was definitely promised nine years from that date, that is in 1917, reforms to be gradually introduced in the meanwhile. A number of political associations have been formed to aid in the task of preparing the country for constitutional government, such as the Association for Preparing Constitutional Citizenship, the Constitutional Discussion Society, the Association for the Study of the Constitution, and others.

OTHER EVENTS. In February an Imperial decree created a new Naval Department with Prince Su as chief and Prince Ching as adviser. In March an Imperial edict was issued thanking the Powers for their co-operation toward the suppression of opium and declaring that China's anti-opium policy must be strictly enforced. It ordered means to be found for the replacement of the opium tax by some other means of raising revenue. In July an Imperial edict was issued to carry into effect the preliminary measures for the naval reorganization recommended by a Commission of Investigation. It created a naval and military advisory board, thus advancing toward a central administration in place of the subdivided control under four separate viceroys, and it appointed the Regent's brother and one of the admirals to carry the plans into effect. During the year considerable progress was made toward the establishment of a Chinese university by the Chinese Emergency Committee. This project for a Christian, but undenominational, university, in Central China was first broached by Lord William Cecil and has been supported from the first by the Universities of Oxford and Cambridge. Among the leaders of the movement are Sir Robert Hart, the Archbishop of Canterbury and the Lord-Mayor of London, and many prominent public men and members of religious bodies in England. It aims not at devising new methods, but at correlating existing institutions. It was decided that the best site was in the populous district occupied by the three great cities, Hankow, Wuchang and Hanyang, where there were already three Christian colleges under American and English control, which, it was thought, might be a nucleus for the new university. A number of subscriptions were made to the funds for this purpose during the year. Another important event was the establishment of the University of Hong-Kong (q. v.). During the year there was an increase in the already large number of Chinese students in Japan, who early in the year were said to number 10,000. Some trouble arose over the

boycotting of the British steamers at Kiukiang, but the trouble seemed to be subsiding in the closing months of the year. Posthumous honors were rendered by Imperial decree to one Yung Lin, whose suicide was a typical instance of the Oriental method of displaying devotion to a cause. He killed himself in order to throw a proper emphasis upon a memorial which he addressed to the government on behalf of reform. The memorial sets forth the dangers of corrupt administration, blames the people for their wasteful expenditures, the officials for their venality and peculations, and the higher authorities for their failure to punish wrong-doers. It urges the need of radical reforms, the selection of good and able administrators, and the development of the national resources.

CHLOROPHYLL. See BOTANY.

CHOLEMIA. This curious affection was studied by Hawkins and Dudgeon in 1909. Isolated cases have been observed for many years, but so far have been little studied. The condition is a congenital and a family affection and is characterized by the presence of the constituents of the bile in the blood. The patient differs from most jaundiced individuals, however, in several respects. Jaundice appears at birth or soon after and persists for years with little or no change. It differs also from ordinary icterus in that the urine is free from bile pigment, and itching and other signs of constitutional disturbances are lacking. There is no stomach or intestinal disturbance, the appetite is good, and the bowels regular. Both physical and mental development are normal. Beside the jaundice, there is some enlargement of the spleen and a moderately severe anæmia. Life does not appear to be shortened by the disease. Certain physicians of the French school have tried to establish a relation between congenital family cholemia and dark muddy complexions, melanoderma and various pigmentary skin diseases. Hawkins and Dudgeon suggest as a possible cause inborn defects in the minute structure of the liver, allowing the bile to enter directly into the lymphatics, or changes in the ducts affecting bile pressure. They found that the red blood cells in these patients were abnormally fragile and that they occasionally had hemoglobinuria.

CHOLERA. There was a severe epidemic of cholera in Russia during 1909. In St. Petersburg alone about 14,000 persons were attacked and 5500 died of the disease. It is estimated that 30,000 cases occurred in Russia, of whom 13,253 died (about 50 per cent.). The epidemic spread to East Prussia, and was introduced into Holland by sea, 15 cases and 10 deaths having occurred at Rotterdam. There were also 6 deaths at Boom, in Belgium. Blumenthal calls attention to the freedom enjoyed by Moscow from the epidemic and attributes this circumstance to the installation of a good water supply. During the year there were only 16 cases of cholera at Moscow, whereas in previous epidemics, particularly those of 1830, 1848 and 1853, there were respectively 8798, 59,000 and 4000, with a mortality approximating 50 per cent. In 1893 a new water system was installed, providing the city with good spring water, supplemented later by a filtering plant for the river water. Prophylactic vaccination against cholera was formally adopted by the authorities and a circular of instructions published for general distribution. The circular urges the following points:

1. The statistics to date show that prophylactic vaccination guarantees a certain protection against cholera, but the vaccinated must observe the general hygienic precautions.
2. The vaccination must not be compulsory.
3. Anti-cholera vaccination is harmless and causes only a brief reaction.
4. Of the two methods in vogue, vaccination with living cultures (Haffkine), or with killed cultures (Kolle), the latter is to be preferred.
5. During the epidemic of cholera vaccination must be done with great care, to exclude those already infected, and those liable to be exposed to infection before immunity is established.
6. Vaccination must be repeated two or three times at intervals of from five to seven days. The first dose of from 0.5 to 1 c.c. can be increased to 2 or 3 c.c. on repetition.
7. Physicians were urged to keep a careful record of all data. See VITAL STATISTICS.

CHRISTIAN CONNECTION. See CHRISTIANS.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. A religious society for young people founded in Portland, Maine, in 1891 by Reverend Francis E. Clark. There were in 1909 71,789 societies with a membership of about 3,559,000. The 24th International Christian Endeavor Convention was held at St. Paul, Minn., July 7-12, 1909, and the 4th World's Christian Endeavor Convention was held at Agra, India, November 20-23. During the year the Society purchased a site on the corner of Huntington and Longwood Avenues, Boston, for the new International Headquarters Building, for the erection of which a movement has been carried on since 1905. This building was to cost in the neighborhood of \$75,000. The officers in 1908 were: President, Francis E. Clark, D. D., LL. D.; General Secretary, William Shaw; Editorial Secretary, Amos R. Wells; Treasurer, Hiram N. Lathrop; Publication Manager, George B. Graff. The official organ is the *Christian Endeavor World*, published in Boston.

CHRISTIANS. A religious denomination in the United States and Canada, which originated in the early part of the nineteenth century. It claims the name Christians "not as a sect name, but fraternally, as a name of union." The church allows latitude of theological views and asserts the importance of fellowship of all followers of Christ. Two bodies, called the Christian Church and the Christian Church South, which were separated in 1854 through failure to agree on the slavery question, are now closely affiliated. The denomination, according to the latest available statistics, has 101,539 members, 1340 churches and 1348 ministers. Missionary and educational interests of the church were carried on by aggressive and energetic measures during 1909. During the year \$26,353 were spent for its missions. In the various schools of the denomination are enrolled about 1000 students with about 75 instructors. During 1909 schools were established in Alabama, Virginia, and Wyoming. In the last State a colony was formed at Jireh and a college opened there. The cornerstone of the building was laid October 21, 1909. The annual expenditures of the church are about \$75,000. There are 277 Christian Endeavor societies in the church with a membership of about 7000. The official organ of the denomination is the *Herald of Gospel Liberty*, published at Dayton,

Ohio. The meetings of the American Christian Convention, which are quadrennial, will be held in 1910. This representative body has charge of the general, educational, missionary and other interests of the church.

CHRISTIAN SCIENTISTS. The designation employed by members of a religious denomination, which was founded by Mrs. Mary Baker Eddy. The doctrines of Christian Science are taken from an interpretation of the Scriptures contained in *Science and Health with a Key to the Scriptures*, written by Mrs. Eddy and published in 1875. The Church of Christ, Scientist, was founded in 1879. The First Church of Christ, Scientist, Boston, Mass., of which Mrs. Eddy is honorary pastor, is the Mother Church of the denomination, all others being branch churches. No exact statistics are available for the strength of the denomination, but, according to the latest figures available, there were in 1909 about 85,000 communicants, 668 churches and 1336 readers, who fill the place of ministers. There are many institutions for teaching Christian Science and about 4000 practitioners of Christian Science mind healing. Organizations exist in almost every State in the United States, and there are branches in Canada, Nova Scotia, British Columbia, Mexico, the Bahamas, British West Indies, the Hawaiian Islands, Cuba, Philippine Islands, Great Britain, France, Germany, Norway, Switzerland, Italy, Austria, China, South Africa and other countries.

The most important event in the history of the church in 1909 was the discipline of Mrs. Augusta E. Stetson by the First Church of Christ, Scientist, in Boston. Mrs. Stetson was formerly first reader of the First Church of Christ, Scientist, in New York. Mrs. Stetson had for many years been at the head of this church. Charges were brought against her and several of her students that her methods of mental healing were at variance with the principles of Christian Science. By a number of witnesses it was alleged, among other things, that she had fallen into error by indulging in mental malpractice, and that she had expressed a desire that harm might come to several of those whom she considered to be her enemies in the church. Mrs. Stetson insisted on her loyalty to Mrs. Eddy and her teachings. She was, however, brought before the members of the First Church of Christ, Scientist, of Boston, and after a prolonged hearing was deprived of her right to teach and practice, and of membership in the Mother Church. Subsequently the members of the First Church of Christ, Scientist, of New York, a majority of whom had been thought to be adherents of Mrs. Stetson, took action which signified its approval of the action of the Board of Directors of the Mother Church in Boston. Mrs. Stetson accordingly withdrew from all connection with the church.

CHURCHES OF GOD. A religious denomination whose doctrines agree in general with those held by the Baptists. It was founded in 1830, as the result of the preaching of John Winebrenner, a German Reformed pastor at Harrisburg, Pa. The denomination is sometimes given the name of Winebrennians. In 1909 the denomination numbered 24,356 communicants, with 518 churches and 482 ministers. The churches are divided into seventeen annual elderships, delegates from which con-

stitute the general eldership of the Churches of God, which meets every four years. The denomination is strongest in Pennsylvania, West Virginia, and the States of the Central West. A college is maintained at Findlay, O., and a collegiate institute at Fort Scott, Kansas. Mission work is carried on in India. The denomination has a publishing house and book-store at Harrisburg.

CHURCH OF CHRIST, SCIENTIST. See CHRISTIAN SCIENTISTS.

CIGARS AND CIGARETTES. See TOBACCO.

CIVIC ASSOCIATION, AMERICAN. An organization formed in 1904 at St. Louis as a merger of two national organizations which had previously existed, with similar purposes. The Association devotes its efforts to the solution of physical as distinguished from the political problems of communities, and particularly to the unfolding and development of the ideals of beauty and efficiency of home, town, city and national life. Its activities are conducted through various departments, and included in its work have been efforts to make living conditions clean, healthful and attractive, to extend the making of public parks, to promote the opening of gardens and playgrounds for children and recreation centres for adults, to abate public nuisances, including bill boards, objectionable signs, needless noises and unpleasant and wasteful smoking factory chimneys; to preserve great scenic wonders, such as Niagara Falls and the White Mountains, from commercial spoliation. During the year 1909, through the direction of the Association, marked advances were made toward obtaining uniform legislation in forestry, city tree planting, the elimination of smoke and the abatement of the bill board nuisances. In its continuous efforts for the preservation of Niagara Falls, the Association was active early in the year in securing the passage of a joint resolution of Congress, continuing in effect the Burton bill, which limits the amount of water which can be diverted from the Falls for commercial purposes. Only by the most diligent efforts of the Association have the Falls been saved in their beauty to the American people. The Association has been active in impressing upon cities the importance of proceeding along comprehensive lines for park and boulevard development. At the annual convention of the Association, held in Cincinnati, in November, 1909, city planning was one of the leading subjects for discussion. In the year 1910 a new department will put forth energetic efforts for the elimination of the common house fly as a menace to health. Another department will conduct a campaign for civic education, enlisting the coöperation of churches and schools. The officers of the Association, elected in November, 1909, for the year 1910, were as follows: President, J. Horace McFarland; First Vice-President, Clinton Rogers Woodruff; Treasurer, William B. Howland; Secretary, Richard B. Watrous; Vice-Presidents, James R. Garfield, Rev. John Wesley Hill, W. W. Hannan, George W. Marston and Mrs. Edward W. Biddle. The headquarters of the Association are in Washington.

CIVIC FEDERATION, NATIONAL. An organization founded in Chicago in 1900 "to organize the best brains of the nation in an educational movement toward the solution of

some of the great problems relating to social and industrial progress; to provide for the study and discussion of questions of national import; to do this under the crystallization of the most enlightened public opinion; and when desirable form legislation in accordance therewith." The work of the Federation is done with various bureaus. Among the most important of these is the Welfare Department, the function of which is to promote welfare work among the employees of private enterprise and among those engaged in government service. The Federation has been particularly active in attempts to bring to pass adequate employers' liability laws.

The achievements of the National Civic Federation for the year 1909 culminated in the annual meeting and in the national conference on uniform State legislation which the Federation called in Washington early in January, 1910. A brief description of these two gatherings, attended by leading employers, leading labor men and representatives of the general public, will indicate to what ends the Federation's energies were bent in 1909.

The several sessions of the annual meeting on November 22 and 23 at Hotel Astor, New York, including the annual banquet, were devoted to discussions of wage earners' insurance in its various forms. The subject covered governmental employees as well as employees in private enterprises, and was considered under the various forms of compensation for victims of industrial accidents, employers' voluntary sick and death funds and retirement funds or old age pensions. Such topics were chosen by the participants as: "The Next Step in Employers' Liability in the United States," "Shall the Industry Bear the Burden Incident to Industrial Accidents," "The Constitutional Phase of Providing for Compulsory Compensation in Industrial Accidents," "Avoidance of Accidents More Important than Compensation," "Do Employers' Voluntary Relief Funds Adequately Compensate?" etc. The speakers included public men, wage earners and employers. English and German authorities on the subjects of compensation in their countries also delivered addresses.

Recognizing that in the United States some of the large railway systems, some of the large industrial corporations, the insurance companies, labor organizations, benefit associations and philanthropists have from their several standpoints put into practice for special groups of people some forms of compensation; and that the leading European countries have already legislated on compensation and insurance subjects in varying ways with varying success; the aim of the annual meeting was to look at the question from all sides and offer to the public, through its various speakers, fair presentations of systems of wage earners' compensation and insurance which are at present practiced and which might be more widely extended in this country. See EMPLOYERS' LIABILITY.

As a result of the annual meeting the following committees were formed: Committee on Prevention of Mining Accidents, Mr. John Hays Hammond, mining engineer, chairman; Committee on Wage Earners' Insurance, Mr. George W. Perkins, chairman; Committee on Compensation for Industrial Accidents and their Prevention, Mr. August Belmont, chairman; Committee on Pensions for Public Employees, Hon. William R. Willcox, chairman.

Such a subject as wage earners' compensa-

tion and insurance is naturally a prominent one with the Welfare Department of the National Civic Federation. No better idea of its constantly broadening work can be gained than through illustrations given by the chairman of the department in his annual address. He said in part: "One company in New Hampshire, employing twelve thousand operatives, is now introducing a comprehensive plan for housing and recreation, an improvement upon anything which has yet been undertaken in the United States. The mills of this company are already models of cleanliness and appliances for good ventilation and sanitation."

The Welfare Department, in three ways, has secured unique co-operation by:

- (1) Addressing letters of information and inquiry to employers in fifty different industries;
- (2) Securing the consent of employers' associations to arrange programmes at their annual meetings on the welfare work in their respective trades; and
- (3) Asking trade journals to collect and publish illustrated accounts of welfare work in the industries covered by their periodicals.

The reports of the Woman's Welfare Department, as presented at the annual meeting by the executive heads of the Columbia, North Carolina, New York and New Jersey, and California sections, the Committee for Industrial Employees, etc., covered a wide and useful field, ranging from careful investigation of the cotton industry and factories of the garment trade to endeavors for better working conditions for government employees in Washington, D. C., establishment of lunch rooms in different localities, nurseries, and homes for mill girls. The aim of this department continues to be "to use its influence in securing needed improvements in the working and living conditions of women and men wage earners in the various industries and in government employ." The membership is largely composed of women who are themselves stockholders, or who through family relationships are interested in industrial organizations.

During 1909 the National Civic Federation was preparing for the great national conference on uniform State legislation held at the Belasco Theatre, Washington, D. C., January 17-19, 1910. In calling this conference, the National Civic Federation worked in close conjunction with the Conference of Governors and the national association of Commissioners on Uniform State Laws.

CIVIC TRAINING, See EDUCATION IN THE UNITED STATES.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. A federation of the various civil service reform associations throughout the United States, the first of which was founded in 1877 in New York City. Other associations were subsequently formed and the New York Association extended its membership to localities outside of New York. Following the assassination of President Garfield by a disappointed office seeker a conference of delegates from the Association was held at Newport, R. I., in 1881. As the result of this conference the League was formed. Its general purpose as set forth in the constitution is: "To advance the cause of civil service reform in the United States." The extension of civil service reform in the Federal, State and municipal governments has been con-

stant since the organization of the League. In the Federal service over 225,000 positions are now filled in accordance with civil service reform principles. Comprehensive civil service laws, applying to both State and municipal governments, have been adopted in New York, Massachusetts and New Jersey. In Wisconsin the civil service law applies to the entire State service and a general law requires appointments in the police and fire service of cities to be made as the result of examination. In Colorado and Illinois there are civil service laws affecting the service of State institutions. Civil service laws have also been adopted in the following principal cities: Chicago, Denver, Philadelphia, Pittsburgh, Scranton, San Francisco, Los Angeles, Milwaukee, Cincinnati, Kansas City, Cleveland, Des Moines, and Norfolk. In this remarkable progress the League and its constituent associations have taken an active and important part. During 1909 the following achievements of the League may be noted: The Crumpacker Census Bill, introduced in 1908, provided for the selection of the 4000 additional clerks on the old "spoils" basis. By an active campaign the League aroused so much public opposition to this feature that the bill as finally passed in 1909 provided for competitive examinations. (See article UNITED STATES, paragraph *Census*.) The League has for many years advocated the selection of the fourth-class postmasters, numbering about 50,000, through competition. In the latter part of 1908 representatives from the League visited President Roosevelt and urged him to place these important positions in the competitive class. Shortly afterward he issued an order, classifying, as a beginning, some 15,000 postmasters. Political activity of office holders in the unclassified service (not covered by the civil service rules) has long been a notorious evil, and a special committee of the League made a careful investigation during 1908-9 as to the part taken by these office holders in the recent campaign and published a report showing the menace to free institutions which lay in such activity. There are two classes in individual membership in the League, associate members at \$5 per year, and sustaining members at \$25. The officers in 1909 were: Charles W. Eliot, President; Richard Henry Dana, Chairman of the Council; A. S. Frissell, Treasurer, and Elliot S. Goodwin, Secretary.

CLARK UNIVERSITY. An institution of higher learning at Worcester, Mass., founded in 1889. The chief aim of the University is the encouragement of original research, although it includes an undergraduate college department. The College, however, is a distinct organization in itself. The attendance in 1909 was 109 in the University, and 208 in the College. The University includes nine departments. It publishes the *American Journal of Psychology*, the *Pedagogical Seminary*, and the *American Journal of Religious Psychology and Education*. The president of the University is G. Stanley Hall; Carroll D. Wright, president of the College, died in 1909, and was succeeded by Edmund Clark Sanford, who was professor of experimental and comparative psychology at the University. The endowment of the University and College is about \$4,000,000.

CLEBORNE, CHRISTOPHER JAMES. An American surgeon and rear-admiral (retired),

died October 2, 1909. He was born in Edinburgh, Scotland, in 1838, and entered the United States naval service in 1861 as assistant surgeon. He served throughout the war and in 1863 was promoted to the rank of surgeon. In 1878 he was made medical inspector and in 1887 medical director. During the Spanish-American war he was on duty in command of the United States Naval Hospital at Norfolk, Va. On November 10, 1899, he was transferred to the retired list as a medical director, with the rank of rear-admiral.

CLIMATE, MODIFICATIONS OF. See GEOLOGY.

COAL. In the following account of the coal production of the United States and foreign countries, statistics relate only to the total production. The production of the individual States in 1908 and in 1909, so far as they are available, will be found in the articles on these States. The production of foreign countries will be found in the statistical matter covering these countries. The year 1908 was one of general depression in the coal-mining industry, yet its total production exceeded that of any year in the history of coal mining in the United States, with the single exception of 1907, which was a year of record-breaking activity and production. There were produced in 1908 415,842,898 short tons of coal of a spot value of \$532,314,173. Of this total production 74,347,102 long tons were Pennsylvania anthracite and 332,573,944 were bituminous and lignite. The total production in 1907 was 480,363,424 short tons, valued at \$614,798,898, of which 85,604,312 short tons or 76,432,421 long tons were Pennsylvania anthracite, and 394,759,112 short tons were bituminous, semi-bituminous and lignite. Compared with this record the production in 1908 showed a decrease of 64,520,726 short tons. In spite of the depressed conditions in 1908 the decrease in the production of Pennsylvania anthracite was only 2,335,558 short tons. A considerable falling off in the demand was naturally to be expected in view of the depressed conditions, especially in the great manufacturing centres of the East, where anthracite is so largely used. But the results as recorded indicate that as limited as the territory is for the consumption of anthracite, some curtailment in the individual demand was, probably, to a large extent offset by the increased population in the anthracite-producing territory. In the production of bituminous coal, however, the decrease in 1908 as compared with 1907 amounted to 62,185,168 short tons in quantity and \$77,079,504 in value. In the face of the demoralized trade conditions the insignificant larger decrease in the percentage of value as compared with the production is notable, and was in part due to the necessity of maintaining prices because of the fact that in most of the important producing States operations are carried on under agreement with the United Mine Workers of America, and there was no cut in mining wages, so that the cost of mining was relatively as high as in the more prosperous years of 1906-7. Another reason for the slight falling off in value was the fact that on account of trade conditions consumers were more exacting in their demands than they were in 1906-7, when operators were able to market practically all the coal that they could mine. This caused a larger percentage of slack and other salable coal to be thrown on the dumps in 1908, so that the

returns to the operators were considerably less than appears in the statistical records.

Of the thirty States and Territories which produced coal in 1907-8, there were only three in which increased production was shown in the latter year, these being California, Oregon and Texas. The increases in the first two States named were unimportant. The increase in Texas was due in part to the continued decrease of the production of petroleum in the State, and in part to the rapid growth of population and the comparatively prosperous conditions which prevailed in that State. Massachusetts in 1908 appeared for the first time as a coal producer, a small quantity, about fifty tons of lignite, having been mined at Vineyard Haven for local use during the year.

Of the total decrease of 62,185,168 short tons in the production of bituminous coal, approximately 30 per cent., or 18,061,478 short tons, was in the amount of coal made into coke. The largest decrease in the production of bituminous coal showed first in Pennsylvania, with West Virginia second and Ohio third.

The total production of coal in the United States, from the beginning of coal mining, amounted at the end of 1908 to 5,970,576,865 short tons. The growth of the industry in recent years is shown from the fact that the average annual production from 1896 to 1905 was 283,240,275 short tons, while the average production from the three years 1906 to 1908 inclusive was 436,787,800 short tons, showing an increase of 153,547,525 short tons, or 54.2 per cent.

The coal mines of the United States gave employment in 1908 to a total of 690,438 men as compared with 680,492 in 1907, and 640,780 in 1906. The increase in the number of men employed in 1908 as compared with 1907 gives a reasonably fair indication of the condition of the labor market in 1908. In the production of anthracite the average output made by each man in 1908 was 478 short tons as against 512 short tons in 1907. The average bituminous production for each man in 1908 was 644 tons as against 769 tons in 1907.

The total quantity of coal mined by machines in 1908 amounted to 123,183,334 short tons, which was equivalent to 37½ per cent. of the total production in the States where machines were employed. This is an increase of about two per cent. over the machine production of 1907.

The year 1908 offered a marked contrast to 1907 so far as interruption to mining operations because of labor troubles was concerned. There were fewer men idle because of strikes or lockouts in 1907 than in any year since 1901, and the amount of time lost from this cause in that year was the smallest in a decade. In the spring of 1908 the wage agreement, which had been made in 1906 for two years, expired, and on April 1 there was in the "organized" States a general suspension of mining operations pending the renewal of the wage agreement. The suspension was, however, of a pacific character, and while the mines were closed down, there was, as a general thing, good feeling between the contending parties and there were, with the exception of Alabama, but few instances of disorder or violence.

Practically the entire output of both anthracite and bituminous coal in the United States

is consumed within the country. The total exports of coal in 1908 amounted to 13,275,558 short tons, which, deducted from the production of 415,842,698 short tons, shows a consumption of coal of domestic production amounting to 402,567,140 short tons. If to this are added the imports, which in 1908 amounted to 1,645,444 short tons, the total consumption of coal in the United States in 1908 is shown to have been 404,212,584 short tons, equivalent to 97 per cent. of the domestic production.

There were fewer miners killed in the coal mines of the United States in 1908 than in 1907, but with the exception of the latter year, the record was the largest in the history of the industry, while in the number of men injured the record for 1908 exceeded that of even 1907. The total number of deaths from accidents in the coal mines in the United States was 2450 as compared with 3125 in 1907. The number of non-fatal accidents increased from 5316 to 6772. Of the 2450 men killed in 1908, 678 were in the anthracite mines of Pennsylvania and 1772 bituminous mine workers. Of the 6722 injured 1170 were anthracite workers and 5602 were employed in the bituminous mines. The death rate per thousand employees in 1908 was 3.6 and the number of tons mined for each life lost was 167,545. In 1908 there were 396 fatalities due to gas and dust explosions, while 326 men were injured from such explosions. There were 1080 killed and 2591 injured by the falling of roofs. The impression that most of the deaths in coal mines are caused by explosions is, therefore, a popular error.

The average price per ton for coal at the mines in 1908 was \$1.28, which was the same figure as in 1907. The average of the Pennsylvania anthracite was \$1.90, while that of the bituminous was \$1.12. Anthracite shows a decrease of one cent from the price of 1907 and the bituminous a decrease of two cents.

The business depression of 1908 was felt more severely in the United States than elsewhere. The coal production fell off in Great Britain but not to such an extent as in the United States. It declined slightly in Belgium, and increased in Germany, France, India, Canada, and New South Wales. Because of the serious effects of the depression on the United States the percentage of the world's supply produced in this country decreased from 39.4 in 1907 to 35.6 in 1908. In Table No. 1 is presented a statement of the coal production of the principal countries of the world in the latest years for which figures are available.

The production of coal in the United States in 1909, while exceeding that of 1908, did not reach the high-water mark attained in 1907. It was impossible to give accurate information regarding tonnage at the close of the year, but from reports received from the United States Geological Survey, it is apparent that the increase in production in 1909 over 1908 was between 8 and 10 per cent., which would indicate a total production of from 440,000,000 to 450,000,000 short tons. The shipment of anthracite from the mines during the eleven months ending November 30, 1909, amounted to 56,194,447 long tons against 58,837,076 long tons for the same period in 1908. The larger production from the anthracite mines in Pennsylvania in 1908 was caused by stimulated activity due to an apprehension of suspension on April 1,

TABLE No. 1

THE WORLD'S PRODUCTION OF COAL

Country	Usual unit in producing country	Equivalent in short tons
United States (1908)	long tons	871,288,123 415,842,698
Great Britain (1908)	do	261,506,379 292,887,144
Germany (1908)	metric tons	215,283,474 237,804,973
Austria-Hungary (1907)	do	48,180,849 53,109,750
France (1908)	do	37,622,556 41,471,343
Russia and Finland (1907)	do	26,023,344 28,685,533
Belgium (1908)	do	22,079,300 24,009,392
Japan (1907)	do	15,935,052 15,361,000
India (1908)	long tons	12,769,635 14,301,991
Canada (1908)	short tons	10,904,466 10,904,466
New South Wales (1908)	long tons	9,147,023 10,244,068
Spain (1907)	metric tons	8,887,286 4,294,900
Transvaal (1908)	long tons	5,012,692 8,374,915
New Zealand (1907)	do	1,831,069 8,050,730
Natal (1907)	do	1,530,043 1,713,648
Queensland and Victoria (1907)	do	964,229 1,079,936

1909, when the wage agreements would terminate. This activity continued during the first three months of 1909, and the shipments in March, 1909, were the largest in the history of the trade. With the renewal of the wage scale in April, which was a continuance of the awards of the anthracite strike commission for a third period of three years, production fell off, and the shipments of the summer months of 1909 were much less than in either 1907 or 1908. In Maryland, Virginia and West Virginia, the production of 1909 was nearly equal to that of 1907. In the State last named an epoch-making incident in the development of the coal-mining industry was the completion early in the year of the Virginian Railway, the first transportation line in the United States constructed from the coal fields to the seaboard. Increased production of from 15 to 20 per cent. was shown in Alabama. In the interior States, Illinois, Indiana and western Kentucky, and to some extent in Iowa, Kansas and Missouri, the chief influences affecting the coal-mining industry in 1909 was the increased use of oil and gas for fuel, and also the use of coke and of Eastern coals, which followed the agitation with regard to the suppression of smoke. In Arkansas, Oklahoma and Texas the production in 1909 was about the same as in 1908, while in the Rocky Mountain States reports at the end of the year indicated a much better condition in the affairs of 1909 than in 1908. In these States mining operations have not been interfered with by strikes, suspensions, or lockouts, the supply of labor has been satisfactory and the coal mines did not suffer from shortage of cars.

The total production of coal in 1909 is estimated by the *Engineering and Mining Journal* at 437,176,241 short tons. These estimates were based on reports of State mining inspectors and with estimates made when there were no statisites available. Table No. 2 gives the production of coal in the United States by States, according to the estimates of this authority:

TABLE No. 2
PRODUCTION OF COAL IN THE UNITED STATES

States	Bituminous	
	1908 Short Tons	1909 Short Tons
Alabama	11,523,299	11,983,920
Arkansas	1,866,565	1,950,000
California and Alaska	21,760	25,000
Colorado	9,703,587	10,666,459
Georgia and No. Carolina	301,640	300,000
Illinois	51,507,991	(a) 49,163,710
Indiana	10,987,419	12,200,000
Iowa	7,490,000	7,500,000
Kansas	5,960,417	6,000,000
Kentucky	9,805,777	9,950,000
Maryland	4,377,094	4,600,000
Michigan	1,839,927	1,900,000
Missouri	3,547,000	3,600,000
Montana	1,979,417	2,204,000
New Mexico	2,772,586	3,010,000
North Dakota	317,840	336,000
Ohio	28,101,949	28,197,000
Oklahoma	3,633,108	3,187,200
Oregon	60,000	72,000
Pennsylvania	118,309,680	130,157,582
Tennessee	6,082,851	6,234,922
Texas	1,280,490	1,310,400
Utah	1,786,204	2,324,715
Virginia	4,224,821	4,310,000
Washington	2,977,490	3,307,000
West Virginia	41,360,500	47,469,797
Wyoming	6,100,000	8,197,200
Nevada and Idaho	10,240	10,000
Total bituminous	337,929,632	360,076,905
Anthracite		
Colorado	69,440	70,000
New Mexico	20,000	20,000
Pennsylvania	80,240,138	77,009,336
Total anthracite	80,320,578	77,009,336
Grand total	418,259,210	437,176,241

(a) For the fiscal years ending June 30.

For an account of labor troubles in coal-mining regions see STRIKES. For the coal fields of Alaska, see ALASKA; PUBLIC LANDS.

COCAINE HABIT. The wide prevalence of this degrading practice was the cause of continued alarm in 1909, and laws, forbidding the sale of cocaine, except on physician's prescription, were enacted or proposed in several States,

while in others vigorous efforts were made to enforce the already existing statutes against its promiscuous sale. Dr. Walter Bensel, sanitary superintendent of New York City, made an appeal to the Woman's Municipal League for funds to enable the health authorities to fight the traffic. He stated that many physicians bought cocaine for the purpose of selling it, but that there was no money to obtain convictions. In Chicago a new law was put into force and the conviction of two druggists for selling cocaine catarrh powder obtained, and a fine of \$500 imposed. The law holds that cocaine must not be sold in "patent medicines," or any form excepting on the prescription of a physician. In general it may be said that the health authorities have had uphill work on account of slow and tedious legal methods, the many loopholes of escape afforded the delinquents, and the local prejudice in favor of certain defendants. In Baltimore it has been decided that the State must present expert testimony when prosecuting alleged violators of the cocaine law, in order to obtain convictions. In a case under trial the judge said that unless the State could prove beyond doubt that the defendant (a physician accused of having prescribed cocaine illegally) had not given proper medical treatment, he could not find him guilty.

COCHIN-CHINA. A French colony and one of the states of French Indo-China (q. v.). Area, 21,988 square miles. Population (1906), 1,193,534. The population is mainly made up of Annamites, Cambodians, Mois, Chams, Chinese, and a few Indians, Malays, and Tagals. Saigon, the capital and chief port, has 50,870 inhabitants; Cholon, about 130,000. There are about 380 schools, with 800 teachers and 19,000 pupils, besides a school of medicine at Saigon. The Buddhists number over a million, and the Roman Catholics about 73,000. Extensive irrigation and drainage works are under construction in the central and southwestern parts. Forests cover 1,748,694 hectares, and of the 1,522,666 hectares under cultivation, 1,358,706 are devoted to rice. The rice crop in 1907 was estimated at 1,200,000 tons; 1908, 900,000 tons; 1909, 1,500,000 tons. Other crops are corn, beans, sweet potatoes, earth-nuts, cotton, sugar-cane, tobacco, pepper, fruits, etc. The live-stock is given as 241,744 buffaloes, 109,074 cattle, 11,243 horses, 709,380 swine, and 3492 sheep and goats. The fishery products are valued at 2,800,000 francs yearly. There are nine rice mills in Saigon and Cholon, with an output of 450 to 900 tons daily. The imports and exports are included in those of French Indo-China. In 1907 824 vessels of 1,290,430 tons cleared from the port of Saigon. There are at Saigon 5 banks or bank-agencies. The colony is administered by a lieutenant-governor (in 1909, J. M. Gourbeil), and is represented in the French Chamber by one deputy.

COCHRAN, DAVID HENRY. An American educator, died October 4, 1909. He was born at Springville, N. Y., in 1828, and graduated at Hamilton College in 1850. From 1850 to 1852 he was professor of natural science at the Clinton Liberal Institute. From 1852 to 1855 he was professor of natural science in Fredonia Academy. In 1855 he was appointed professor of chemistry and physics in the New York State Normal College, and in the following year he was chosen president of that institution, serv-

ing in that capacity until 1864. From 1864 to 1900 he was president of the Brooklyn Collegiate and Polytechnic Institute. In the latter year he retired. He was president of the American Society for the Regulation of Vivisection and was a member of many learned bodies. He was successful in the organization of evening schools and scientific lectures.

COCOS, or KEELING, ISLANDS. A group of about 20 small coral islands lying some 700 miles southwest of Sumatra and 1200 southwest of Singapore. They were administratively attached to the Straits Settlements in 1886, and were annexed to the Settlement of Singapore in 1903. Area, 9 square miles. Population (1904), 640. Cocoanut oil and copra are produced.

COINS, FOREIGN, VALUE OF. The table on page 171 indicates the values of foreign coins in United States money on December 31, 1909:

COKE. The production of coke in 1908, including beehive and retort oven coke, amounted to 26,033,518 short tons, valued at \$62,483,938, against 40,779,594 short tons, valued at \$111,539,126 in 1907, in which year the production exceeded all previous records in the history of coke-making in the United States. The average price per ton in that year was also the highest ever recorded. The production of 1909 was estimated by the *Engineering and Mining Journal* as 29,400,970 tons. The production by States, as estimated by that authority, is given in the table below:

States	1908	1909
Alabama	2,336,602	2,500,000
Colorado	854,662	1,091,882
Georgia and North Carolina	60,000	50,000
Illinois	310,540	315,200
Kansas	10,000	10,000
Kentucky	54,515	64,200
Missouri	5,000	5,000
Montana	29,482	35,600
New Mexico	353,240	430,000
Ohio	240,000	250,000
Oklahoma	24,580	55,000
Pennsylvania	12,287,828	18,717,413
Tennessee	250,491	224,204
Utah	321,200	180,969
Virginia	1,219,927	1,250,000
Washington	37,381	41,090
West Virginia	3,107,000	2,910,412
Other States (a)	1,994,218	2,270,000
Total	23,496,666	29,400,970

(a) Includes output of by-product coke for Massachusetts, Maryland, Minnesota, New York, Michigan, Wisconsin.

It will be noted that the production of 1908, as estimated by this authority, is considerably less than that given in the first paragraph, which is the production as recorded by the United States Geological Survey. Of this the production of the Connellsville and Lower Connellsville regions of Pennsylvania is estimated at 17,800,000 tons, as compared with 10,700,000 in 1908. The prices of coke in 1909 showed the most spectacular movement in the history of the industry. At the opening of the year furnace coke contracts were in force at \$1.90 and \$2.00, and by September, contracts for 1910 had been made at the rate of \$2.90. In the latter part of March a project was undertaken to consolidate all the coke operations of the Connellsville and Lower Connellsville regions with the exception of the H. C. Frick Coal Company

Venezuela.....	Gold.....	Bolivar.....	.193	Gold: peso. Silver: peso and divisions.
				Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

NOTE.—The coins of silver-standard countries are valued by their pure silver contents, at the average market price of silver for the three months preceding the date of this circular.

*Gold standard adopted December 31, 1908; 12½ bolivianos equal the pound sterling or Peruvian pound (\$4.866½).

†The sovereign is the standard coin of India, but the rupee (\$0.324½) is the current coin, valued at 15 to the sovereign.

‡Seventy-five centigrams fine gold.

††Value in Mexico, \$0.498.

||The current coin of the Straits Settlements is the silver dollar issued on Government account and which has been given a tentative value of \$0.567758½.

and some of the independent steel and blast furnace interests. The movement, however, did not succeed. The United States Steel Corporation is said to have definitely decided during the year that it will erect no more coke ovens in the Connellsville region, neither the beehive now used nor by-product ovens, except possibly to round out some plants already in operation.

COLGATE UNIVERSITY. An Institution of higher learning at Hamilton, N. Y., founded in 1819. There were in 1909, 330 students with 30 instructors. The library contains about 52,000 volumes. The productive funds amount to about \$1,800,000, and the total income to about \$130,000. In September, Elmer Burritt Bryan (q. v.) was inaugurated president of the University to fill the vacancy caused by the death of Rev. Dr. George Edmunds Merrill.

COLLEGES. See UNIVERSITIES AND COLLEGES, and under individual heads.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLLIER, PETER FENELON. An American publisher, died April 23, 1909. He was born in County Carlow, Ireland, in 1849. In his youth his parents removed to the United States, settling in Cincinnati, and his education was completed in St. Mary's Seminary in that city. Mr. Collier began his business career in New York City, early in the 70's, by selling books from door to door. In 1882 he secured, for a small sum, a complete set of the plates of Dickens's works. He bought a printing press, hired a small loft, and began the publishing business which, in a few years, became very successful. The firm of P. F. Collier & Son published and sold millions of books, chiefly standard works in inexpensive form. He founded, in 1888, *Collier's Weekly*, and this, too, was successful. In 1905 Mr. Collier came prominently before the public as a result of attacks in the *Weekly* against a well-known "society" periodical. He and his son were arrested on a charge of criminal libel brought by the editor of this journal, but the charge was not proved. He retired from active business about fifteen years before his death. He was well known as a sportsman and breeder of horses.

COLOMBIA. A republic of northwestern South America. The capital is Bogotá.

AREA AND POPULATION. The area is variously estimated at from 435,100 to 465,700 square miles. In 1908 a redivision of the country was adopted, whereby 27 departments and two territories were erected. The estimated population in that year was 4,303,000, exclusive of about 30,000 uncivilized Indians. The estimated population of Bogotá is 100,000; the principal commercial towns, with estimated number of inhabitants, are: Medellin, 60,000; Barranquilla, 42,000; Bucaramanga, 25,000; Cartagena, 14,000; Cúcuta, 10,000. Primary instruction is free, but not compulsory, and is largely maintained by the state. Nearly all schools of secondary education, though maintained or assisted by the government, are under the management of the Roman Catholic Church, the established church of the state. There are several normal schools and a few institutions for higher or technical instruction. The reported number of pupils in public schools in 1908 was 236,985.

AGRICULTURE. Agriculture and mining are

the chief industries, but the progress of both is retarded by difficulties with respect to labor and transportation. Though much of the soil is fertile, only a small part of the country is under cultivation. The products include bananas and other tropical fruits, coffee, cocoa, sugar-cane, cotton, corn, rubber, and, on the uplands and mountains, wheat, barley, and various other crops of the temperate zone. Coffee is the staple product, yielding annually about 600,000 bags, but coffee-planting has been much overdone, and the cultivation of bananas, wheat and corn is regarded as more desirable at the present time. In the last half dozen years banana culture has rapidly extended. Large portions of the country are excellently adapted to the raising of live-stock. The estimated number of cattle in 1909 was 4,000,000; besides, there are numerous sheep, goats, and swine. The cattle slaughtered in 1907 numbered 341,528.

MINING. The mineral wealth of Colombia, and especially of the Department of Antioquia, is very great. The leading metal is gold, which is found throughout the country. Antioquia has been called one immense gold field, but mining in large part is still carried on by primitive methods. The average annual output of gold and silver in Colombia is about \$4,000,000. The country is also rich in emeralds, copper, lead, mercury, iron, zinc, platinum, cinnabar, antimony, sulphur, and salt. There are immense petroleum districts, and coal measures are extensive, but very little worked. The famous emerald mines of Muzo and Cosquez are owned by the government. In the spring of 1909 the Muzo mines were leased to an English syndicate for a period of twenty years. The syndicate agreed to sell at least \$1,250,000 worth of emeralds a year.

MANUFACTURES. Manufacturing industries have not yet attained any considerable importance; but in some of the larger towns there are establishments for the manufacture of various articles of common use, as cotton cloth, shoes, hosiery, matches, sugar, liquors, and brick. In Barranquilla and vicinity the flour-milling industry has begun to assume promising proportions.

COMMERCE. The gold values of imports and exports have been as follows:

	1906	1907	1908
Imports.....	\$9,353,345	\$12,088,563	\$13,513,892
Exports.....	14,834,815	13,791,442	14,998,744

At the most important custom houses, imports and exports were in 1908, respectively: Barranquilla, \$8,219,126 and \$6,904,964; Cartagena, \$2,542,650 and \$4,280,565; Buenaventura, \$1,340,322 and \$843,166; Tumaco, \$828,177 and \$1,028,191; Santa Marta, \$185,890 and \$923,306; Cucuta, \$281,014 and \$724,678. The leading imports are flour, lard, sugar, rice, potatoes, cotton goods, and petroleum. The chief exports are gold, coffee, cattle, bananas, rubber, hides, tobacco, lumber, and ivory nuts. The banana export, notably from Santa Marta, increased from 787,244 bunches in 1904 to 2,241,580 bunches in 1908. The foreign trade is principally with the United States, Germany, and Great Britain. Of the coffee export about 67 per cent. goes to the United States, most of the tobacco to Germany, and the cotton to Liverpool or Havre. According to American fig-

ures, the imports from the United States to Colombia in 1908 amounted to \$3,690,014, and the exports to the United States, \$6,897,493, representing gains of over \$500,000 and \$400,000 respectively.

COMMUNICATIONS. Railways open to traffic in 1908 aggregated 461 miles, and since that time a considerable mileage has been finished. It was reported in 1909 that never before had Colombia given so much attention to the development and extension of railways and wagon roads. Nevertheless many years will doubtless elapse before transportation facilities will be adequate to the needs of the country. In February, 1909, the Girardot Railway joined the Sabana Railway at Facatativá, thus connecting Bogotá with Girardot, on the Magdalena River; from Girardot there is steamboat communication with the port of Barranquilla, at the mouth of the river. An important line under construction is the Pacific Railway, which, by July, 1910, it is expected will connect the port of Buenaventura with Cali, whence it will be continued to Palmira, thus opening up the fertile valley of Cauca. Much traffic is carried on by river steamboats. In 1908 there were 10,354 miles of telegraph line.

FINANCE. In 1907 the revenue was \$16,053,751, and the expenditures \$15,992,863. For 1908 revenue and expenditure were reported to balance at \$17,223,818. The chief sources of revenue reported for the latter year were: Customs duties (almost wholly on imports), \$6,500,000; tax on liquors, \$2,100,000; tax on slaughterhouses and hides, \$1,450,000; salt monopoly, \$1,100,000. The principal expenditures were for: Department of Finance, \$6,962,853; Department of War, \$2,731,151; public works, \$2,288,485; ports and telegraphs, \$1,337,714; public instruction, \$767,556. Estimated revenue and expenditure for 1909 were \$16,000,000 and \$14,000,000 respectively. In 1907 the consolidated internal debt (owed to various religious schools and other institutions) was \$5,476,888 dollars (silver); in 1908 the floating internal debt was \$3,063,012 (exclusive of interest guaranteed by the government on bonds and debentures, aggregating \$2,915,000). Neither the consolidated nor the internal debt includes the national paper currency. The external debt, due mostly to British creditors, is stated at \$13,500,000. To this sum must be added \$526,500 arrears of interest and Sabana Railway bonds, amounting to \$935,600. The monetary unit is the gold dollar, of the value of the United States dollar. The outstanding issue of paper amounts probably to more than 700,000,000 pesos. The value of the paper peso in business transactions fluctuates, but is fixed legally at one cent gold.

ARMY AND NAVY. Every able-bodied citizen is liable for service in the national army whose strength is fixed annually by act of Congress. In 1909 (April 1), the peace effective was 6528 men, of which 28 were generals, 45 field or higher officers, 283 subalterns, 159 civil employees, 218 musicians, and about 5000 rank and file. In July, 1907, there was founded at Bogotá a military school with a cadet battalion and cadet battery. The war effective strength of men but partially trained was about 60,000.

The effective navy includes one cruiser and three gunboats.

GOVERNMENT. The executive authority is vested in a president, and the legislative in a

bicameral representative congress. In 1904 General Rafael Reyes was elected President for the constitutional term of four years. But in the following year, by a Congressional resolution, his term of office was extended to ten years, dating from January 1, 1905. In the summer of 1909 General Reyes left the country. (See below.)

HISTORY. In January the treaty which for some time past had been under negotiation between the United States, Panama and Colombia was signed. It secured the recognition of Panama's independence and the adjustment of its boundaries, and bound the United States to pay Colombia \$2,500,000 on the canal concessions. As a result of the Congressional elections held in June, General Rafael Reyes was chosen President. But on July 4 part of the army at Barranquilla, which had risen against the government, seized the municipal authorities, declared Señor Gonzales Valencia President, drove out the police, took possession of the town and captured several steamers on the Magdalena River. A force of 3000 men and six steamers were soon ready to move against them and the revolt was suppressed without difficulty. General Reyes resigned the presidency, assigning as his main reason the opposition in Congress to that portion of the treaty with Panama and the United States which exonerated those countries from injustice to Colombia in the matter of the Panama revolution. He was succeeded by Señor Valencia, who recommended the reference to The Hague of this question and the question as to indemnity for alienation of Colombian territory. The dispute, which for a long time had been going on between Venezuela and Colombia, was settled during the year, and a Colombian representative was sent to Caracas for the first time since the beginning of the Castro administration.

COLORADO. One of the Western Division of the United States. Its total area is 103,658 square miles of land surface and 290 square miles of water surface, or a total of 103,948 square miles. The population in 1900 was 539,700. The population in 1909, according to a Federal estimate made in that year, was 653,506. The capital is Denver.

MINERAL PRODUCTION. The mining of metals is the principal industry of the State. The aggregate value of the mineral production, according to the figures given by the United States Geological Survey in 1908, was \$58,629,487, which was a marked decrease from the value of the product of 1907, which was \$71,105,128. The decrease was in mineral products other than gold. The latter showed a substantial increase over the product of 1907. The product of gold in 1908 was 1,106,385 fine ounces, valued at \$22,871,000, as compared with 1,010,921 fine ounces, valued at \$20,897,600 in 1907. Silver showed a decrease both in the quantity mined and in the value of the product from the value and production of 1907. The comparative figures were as follows: 1908, 10,150,200 fine ounces, valued at \$5,429,400; 1907, 11,495,400 fine ounces, valued at \$7,587,000. On account of the low prices of the metal prevailing during the latter part of 1907 and throughout 1908, the operations of the silver, lead, and zinc mines were greatly curtailed. The production of copper in 1908 remained substantially the same as that in 1907, although the value materially decreased. The respective figures are:

1908, 13,943,878 pounds, valued at \$1,840,592; 1907, 13,998,496 pounds, valued at \$2,799,899. For the second time in a period of fifteen years the coal production of the State showed a decrease as compared with the output of the preceding year. In 1904 the coal-mining industry of the State was seriously affected by labor disturbances, and the production was materially decreased. The trade depression and the stringency in the money market were manifested in Colorado by a decrease in the coal production, which amounted to 1,155,263 short tons as compared with the production of 1907. The comparative figures for the two years were as follows: 1908, 9,634,973 short tons, valued at \$13,586,988; 1907, 10,790,236 short tons, valued at \$15,079,449. The decrease was brought about largely by the shutting down of many of the fuel-consuming industries of Colorado and adjoining States during the year. In addition to this the winter of 1907-8 was exceptionally mild, and as a result of these conditions, many of the coal mines of the State suspended operations, and some did not resume business until late in the fall of 1908. The total number of men employed in the coal mines of the State during the year was 14,523, as compared with 14,223 in 1907. There were 61 killed and 115 injured in the coal mines of the State during the year, as compared with 99 killed and 138 injured in 1907. On account of the unfavorable trade conditions little work in the way of new development in the Colorado coal fields was done in 1908, except the continuation of construction of the Denver, Northwestern and Pacific Railroad from Denver into Routt county, where large quantities of high grade coal are known to exist. The coke production in 1908 amounted to 982,291 short tons, a considerable decrease over the product of 1907, which was 1,421,579 short tons. This includes the product of Utah, which is, however, inconsiderable. The number of establishments in the two States during 1908 remained the same as during 1907, 18. Other leading mineral products are clay products, lead, stone, and mineral waters. A large quantity of zinc is also produced. In 1908 this product was valued at \$2,339,190, as compared with a value of the product in 1907 of \$3,077,086.

The production of gold in 1909 was estimated by the Director of the Mint at 106,305 fine ounces, with a value of \$21,954,700. This is a decrease of \$916,300 in value from the production of 1908. The production of silver was 9,093,600 fine ounces, valued at \$4,730,100.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 3,267,000 bushels, valued at \$2,287,000, from 135,000 acres; winter wheat, 2,673,000 bushels, valued at \$2,486,000, from 90,000 acres; spring wheat, 8,085,000, valued at \$7,519,000, from 275,000 acres; oats, 7,448,000, valued at \$3,947,000, from 196,000 acres; barley, 936,000, valued at \$618,000, from 26,000 acres; rye, 88,000 bushels, valued at \$64,000, from 4000 acres; potatoes, 10,400,000 bushels, valued at \$5,928,000, from 65,000 acres; hay, 1,760,000 tons, valued at \$17,600,000, from 704,000 acres. There has been a general decrease since 1900 in the acreage of hay, but the crop of 1909 was slightly more than that of 1908, which was 1,675,000

tons. The acreage increased from 600,000 in 1908 to 704,000 in 1909. Hay is the most important product in point of value in the State. The acreage of oats and potatoes has increased in recent years. The potato crop of 1909 was over 3,000,000 bushels larger than that of 1908, which was 7,000,000 bushels, while the acreage increased from 56,000 acres in 1908 to 65,000 acres in 1909. The oats crop remained about the same, with a slightly increased production in 1909. The State ranks first in the production of beet sugar. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 280,000; milch cows, 161,000; other cattle, 1,425,000; sheep, 1,729,000; swine, 248,000. The wool clipped in 1909 was 8,000,400 pounds.

EDUCATION. According to the report of the Superintendent of Public Instruction for the years 1907-8, the school population of the State between the ages of 6 and 21 for 1908 was 207,573. Of these 105,140 were male and 102,433 were female. The total number enrolled in the public schools was 160,264, of whom 80,201 were males and 80,067 were females. There were enrolled in the high schools of the State in the same year 12,318. In the rural schools there were 2057 teachers, of whom 1776 were female and 281 were male. In the graded schools there were 3234 teachers, of whom 2719 were female and 515 were male. The average monthly salary in the rural schools for male teachers was \$56.80 and for females \$51.57. In the graded schools the average salary for male teachers was \$92.95 and for females \$65.35. The total amount expended for teachers' salaries during the year was \$2,846,329.

FINANCE. The balance at the end of the fiscal year 1908 was \$2,820,269. The income for the fiscal year 1909 was \$3,054,562. The expenditures for the fiscal year 1909 were \$2,750,151, leaving a balance of \$3,124,580. The chief sources of revenue are from the insurance department, from liquor licenses, fees of the Secretary of State, and from State taxes. The chief disbursements are for the support of the State government and State institutions. The bonded debt at the end of the fiscal year 1909 was \$393,500.

CHARITIES AND CORRECTIONS. The institutions under control of the State, with their populations in 1909, were as follows: Insane Asylum, Pueblo, 902; State Home for Dependent and Neglected Children, Denver, 157; Soldiers' and Sailors' Home, Montevista, 337; State Industrial School for Boys, Golden, 362; State Penitentiary, Cañon City, 701; State Reformatory, Buena Vista, 159. There were also workshops for the adult blind at Denver, a State home and training school for mental defectives at Denver and an industrial school for girls at Morrison. A bill prepared by Judge Ben B. Lindsey was passed by the legislature, providing that delinquent children shall come under the chancery powers of the courts of record. The bill provides for a referee to be called the Master of Discipline to hear cases of persons causing, encouraging or contributing to delinquency or dependency, when it is practicable to try the same before the chancery side of the court. This eliminates to a certain extent the necessity of accustoming a large portion of those having to do with children to the hardening effects of a criminal court and its surroundings. Bills were also passed to

supplement and strengthen existing acts punishing those charged with juvenile delinquency. A bill for the better inspection of factories was also passed. This act requires the better guarding of machinery and the installation of safety appliances. An act was passed for the prevention of the coercion of prisoners for the purpose of obtaining confession. A bill actively supported by Judge Lindsey was passed, intended to assist persons drifting into crime. It creates a probation court wherein it shall be lawful for the judge of the court to hear evidence in relation to all matters properly put before it, to fix the amount of damage committed by the person charged with the offense and, with the consent of the person in whose interest the proceedings were begun, to order reparation to be made by him to the person suffering such damage by return of the property taken or payment of the damage done. The court may impose such conditions on guilty defendants as the case may justify. A bill for the registration of all hospitals, dispensaries and other institutions for the care of the sick or injured and also to prevent the improper disposition of children was also passed.

POLITICS AND GOVERNMENT. On January 12 John F. Shafroth was inaugurated Governor of the State. In his inaugural address he recommended the enactment of a direct primary law fashioned after that in force in Wisconsin, and urged some provision whereby legislative candidates would pledge themselves to abide by the result of a popular vote for United States Senator. He indorsed the ballot reforms which would make impossible the voting of a straight ticket by making a single mark and declared that individuals as well as corporations should be prohibited from contributing to campaign funds. The necessary expenses, he said, should be met by the candidates themselves and by State taxation. He indorsed the guarantee of bank deposits and the initiative and referendum. The Governor condemned the national policy as to forest reserves and claimed that large tracts were unnecessarily set aside in Colorado. Only one of his recommendations was adopted by the legislature, that providing for party campaign expenses to be paid from the treasury. On January 20 the House and Senate in joint session elected Charles J. Hughes, Jr., to the United States Senate to succeed Henry M. Teller. Mr. Hughes had already been chosen as a candidate in the primaries. In the State elections held on April 6 the Anti-Saloon party was largely successful outside of Denver. Colorado Springs on May 15 adopted the commission form of government under a charter which provides for the recall, the initiative and referendum. In August the first election was held under this form of government and the results were in general satisfactory. The municipal government is lodged in a board of five commissioners. In November Grand Junction also adopted the commission form of government with a "preferential choice" form of ballot.

On May 30 five prominent citizens of Denver were indicted on the charge of conspiracy to defraud the government of coal lands said to be valued at \$1,000,000.

The State Auditor took the unique measure in July of docking the salary of Governor Shafroth for a certain number of days on

which he was absent from the State receiving a degree at the University of Michigan. The policy of the State Auditor is to curtail the salary of any State official when the latter is not on hand to transact business. In addition to docking salaries he attempted the collection of expense money received from the State by former officials. He declared that \$150,000 is due from these sources, and requested the Attorney-General to collect it. The Auditor also withheld the salaries of State appointive officers not appointed under the civil service rules. The Attorney-General of the State has held that the Governor is entitled to his salary in his absence from the State unless the Lieutenant-Governor is called upon to perform the duties of his office. On August 30, Judge Lewis in the Federal court at Denver held valid the flat tax of \$2 per year for every thousand dollars of capital stock of foreign corporations imposed by the State. In this connection he sustained the demurrer of former Secretary of State O'Connor to the complaint of the Atchison, Topeka and Santa Fe Railroad that the tax was an interference with interstate commerce. The Santa Fe had paid tax of \$8000 to the Secretary of State under protest. The road sued to recover this amount and the decision of Judge Lewis was the outcome.

OTHER EVENTS. President Taft visited Colorado in the course of his tour through the West and on September 28 he opened the Gunnison irrigating tunnel, the largest single irrigation project ever undertaken by the United States government. The tunnel was driven from two points, six miles apart, one on the Gunnison River, whence the water supply came, and the other at Montrose in the Uncompahgre Valley, on the other side of the range. The cost down to the close of the year was about \$3,500,000. Through this tunnel water will be carried to irrigate from 150,000 to 175,000 acres of land. This land is free, but to prevent speculation only forty acres will be allowed to each homesteader. The South distributing canal was also completed and the East and West canals are under construction and will be finished in 1910. See *IRRIGATION*.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Acts regulating the practice of architects and the business of barbers; for the inspection of factories, the erection of county high schools districts and the physical examination of school children. See above paragraphs, *Charities and Corrections*.

OFFICERS. Governor, John H. Shafroth; Lieutenant-Governor, Stephen R. Fitzgerald; Secretary of State, James B. Pearce; Treasurer, William J. Galligan; Auditor, Roady Kenehan; Bank Commissioner, Emil W. Pfeiffe; Attorney-General, John T. Barnett; Superintendent of Public Instruction, Katherine M. Cook; Commissioner of Insurance, William L. Clayton—all Democrats.

Judiciary: Supreme Court—Chief Justice, Robert W. Steele, Democrat; Justices, John Campbell, Republican; S. H. White, Democrat; W. A. Hill, Democrat; M. S. Bailey, Democrat; William H. Gabbert, Republican; G. W. Musser, Democrat; Clerk, James R. Killian, Democrat.

The State Legislature of 1909 was composed of 20 Democrats and 15 Republicans in the

Senate, and 53 Democrats and 12 Republicans in the House. The State Representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

COLORADO SPRINGS, COLO. See ELECTORAL REFORM.

COLORED METHODISTS. The Colored Methodists of the United States include those in direct affiliation with the Methodist Episcopal Church and those in independent denominations. Of the latter the most important are the African Methodist Episcopal Church, which had in 1906, the latest year for which statistics are available, 858,323 members, and the African Methodist Episcopal Zion Church, which had in 1908 583,106 members, 3280 churches and 3986 ministers. The Colored Methodist Episcopal Church had a membership in 1909 of 233,911, with 2809 churches and 2893 ministers. Among the Colored Methodist denominations of smaller membership are the Reformed Methodist Union Episcopal Church, with about 5000 members; the Union American Methodist Episcopal Church, with about 18,500 members; the African Union Methodist Protestant Church, with about 4000 members, and the Zion Union Apostolic Church, with about 3000 members.

COLSON, JAMES MAJOR. An American (Negro) educator, died May 22, 1909. He was born in Petersburg, Va., in 1854, and was educated at Dartmouth College. He was appointed to a position in the United States Internal Revenue Office in Petersburg, but resigned to become a teacher in the Virginia Normal and Collegiate Institute. There he remained as professor of natural science for twenty-one years. In 1904 he became principal of the Dinwiddie Agricultural and Industrial Institute. Professor Colson was one of the most prominent Negro educators in the South.

COLUMBIA, BRITISH. See BRITISH COLUMBIA.

COLUMBIA, DISTRICT OF. See DISTRICT OF COLUMBIA.

COLUMBIA UNIVERSITY. An institution of higher learning in New York City, founded in 1754. The attendance in 1909-10 was 6145 (including 1971 summer session students, but excluding 1633 students in extension teaching). These students were distributed as follows: 635 in Columbia College; 513 in Barnard College; 988 non-professional graduate students and 2525 professional students in education, applied science, medicine, law, pharmacy, and fine arts. In 1908-9 all parts of the United States and thirty-five foreign countries were represented in the student body, the graduate students representing 313 other colleges and universities. During 1908-9 Columbia received money gifts of \$498,002.07. Teachers' College received \$463,898.56, and Barnard College, \$13,314.06, a total of \$1,074,637.07. Between 1901 and 1909 the several corporations of the University received a total of \$11,023,511.66 in money gifts. The total assets in 1909 were \$14,137,843.86, in educational equipment, and \$26,704,539.27 in endowment. The library contained 435,000 bound volumes. The total income for 1908-9 (including Barnard College, Teachers' College, and the College of Pharmacy), was \$2,207,501.18. The estimated expenditure for 1909-10 was \$2,505,835.79. In 1909-10 the teaching and adminis-

tative staff of the University numbered 725 persons. Dr. Nicholas Murray Butler is president. At the commencement of 1909, 1242 degrees and diplomas were granted.

For the past decade the University has been enabled to do comparatively little in the development of new fields. The gifts made in that period, generous though they have been—more than \$12,000,000—have of necessity been used largely in the development of the Morningside site, what was left barely serving to enable the institution to keep pace with the growing registration under all its faculties. The splendid bequest of John S. Kennedy, which will amount probably to nearly \$3,000,000, will give an opportunity which the University gladly welcomes. Courses are being formulated in sanitary science, preventive medicine, forest engineering, and agriculture.

Columbia has, in the past year, been strengthening the ties between it and the public and private institutions of the city. An officer of professorial grade has been appointed as chairman of the Undergraduate Admissions Committee, with the intention of building up closer relations with the members of secondary schools. Arrangements have been made with several of the city hospitals whereby senior medical students are enabled to gain practical experience as clinical clerks. The informal co-operative relations with the Union Theological Seminary, which is moving to a site contiguous to the University, have been greatly strengthened. The opportunities open to students in all the professorial courses are being extended as rapidly as possible by bringing them into direct contact with experts—alumni and others—in the professional field which they purpose to enter.

COMETS. See ASTRONOMY.

COMORO ISLANDS. See MAZOTTE.

CONCERTS. See MUSIC.

CONCRETE. With increasing demand for fireproof building and economical construction, concrete continued in 1909 as in the year previous to find increased application. In every branch of structural engineering concrete is employed, so that its use has long ceased to be novel, and as a structural material it must be considered as brick, masonry, steel or timber. It may, however, supplant for different purposes and often with advantage any or all of these materials. While no such immense structure as the Henry Hudson Memorial Bridge at Spuyten Duyvil, New York City, a reinforced concrete arch structure of 1710 feet span, planned in 1907, was proposed in 1909, yet there were a number of reinforced concrete bridges constructed (see BRIDGES) and for much bridge work reinforced concrete had become standard practice. Concrete grain elevators were successfully constructed during the year, and two large six-story warehouses, costing \$300,000, were building at South Brooklyn, New York, for the Bush Warehouse Co. These were 600 x 75 feet and were of considerable strength. Factories, warehouses and other buildings, the construction of many types of which had become standardized, increased, and there was a proportionately increased demand for Portland cement. The use of cement in mines for timbering became more prominent and was found most advantageous. Even an organ was built with concrete pipes and cham-

bers and there was apparently no end to the diversity of its application. While there were the usual engineering investigations and discussions of method and strength, most interesting perhaps was the part played in the campaign for fireproof construction and for economical yet spacious buildings in large cities. This question of buildings of reinforced concrete figured very prominently in the new building code of New York City, passed by the Board of Aldermen and submitted to the Mayor, by whom it was rejected. This code was prepared by the majority members of a commission and contained provisions limiting the height of reinforced concrete buildings to 85 feet, prohibiting the use of concrete made with cinders as a fireproof material, and restricting the use of reinforced concrete walls for elevator shafts. The proposed code was vigorously assailed by the concrete interests and defended by the makers of hollow tile fireproofing. The controversy was very bitter and charges and recriminations, both vague and specific, were uttered. Mayor McClellan vetoed the code, citing among other objections those made to its concrete provisions. He stated that the Board of Fire Underwriters regarded 100 feet as a reasonable limitation in height and quoted Professor William H. Burr as saying that there should be no limitation whatsoever on reinforced concrete construction, there being several buildings higher than 100 feet in New York City which had proved successful notwithstanding severe strains, such as the reciprocating action of printing presses. In regard to cinder concrete Mayor McClellan spoke of the controversy and suggested that further tests should be made by the chief engineer of the Board of Estimate and Apportionment. The hearings before the Mayor brought out a very strong presentation of the claims of reinforced concrete construction, and its value, not only for its strength, but for its fire-resisting properties, was testified to by examples of existing structures in New York City and elsewhere, and by the record of buildings which had successfully resisted fire, not to mention tests made by the United States Geological Survey and various engineering organizations and laboratories.

A severe and practical test of the fireproof qualities of a reinforced concrete factory occurred in a fire at a glue works at Frankford, Philadelphia. The fire to which the building was subjected was so hot as to melt the wire glass window frames in their sashes, which at the time of the fire happened to be open. The building was constructed entirely of reinforced concrete, and not only resisted the fire, but protected an adjoining building. Tests of the fire-resisting properties of concrete blocks in connection with other building materials were made under the direction of Richard L. Humphrey of the United States Geological Survey and were published during the year in *Bulletin No. 370*. It was found that concrete shared with brick preëminence as a fire-resisting material, and of course possessed advantages in the way of economy and ease of application in building. It was also found that concrete blocks perfectly fire-resistant could be made which would withstand the disintegrating effects of fire and water.

An interesting example of the change in the price and availability of materials was shown

in the fact that Mineville, N. Y., a small mining community near the Adirondack Mountains, was rebuilt, and in place of timber concrete was used, not only for the principal buildings, but in the construction of fifty workmen's cottages. The company owning and operating the mines, it may be said, also owned thousands of acres of timber land, so that its choice of concrete was significant. The first cost of workmen's cottages was about the same as that of timber, but their maintenance was vastly less. The houses were very attractive and were found warm and comfortable even in an Adirondack winter.

Concrete railway ties were laid for test in the South and West, and results in the main were satisfactory, though no extended movement for their adoption was manifested. A report of an inspection made in the summer of 1909 of the behavior of 100 ties installed in 1906 near Edgewater, Texas, on the main line of the Galveston branch of the Galveston, Harrisburg and San Antonio Railroad was published during the year. These were found to be in most satisfactory condition, there being no failures where fifty of the ties were installed together "out of face," and only seven showed traces of cracking among fifty interspersed with cypress ties, many of which decayed and required to be replaced, their renewal throwing extra load on the concrete ties.

Concrete telegraph and telephone poles were finding increased application, particularly as the increased prices of timber were taken into consideration. When it is realized that the renewals of wood telephone and telegraph poles alone involve an annual expense of \$13,000,000 and that iron poles represent considerable outlay, the availability of concrete poles, with their long life and the little care involved in their maintenance, will be evident. Up to 35 feet in length a concrete pole can be cast horizontally, and then set in the usual manner, but for taller poles temporary moulds are set up and the pole carrying a reinforcement of steel rods is cast in position. One of these poles 7 inches square at the top and 12 inches square at the ground, 30 feet in height and planted 5 feet in the ground was tested to destruction. No cracking was noticed until the force of the pull was increased to 2800 pounds, and bad cracking sufficient to produce failure did not result until 7200 pounds was applied. With a cedar pole a pull of 840 pounds deflected it at the top 11 inches as compared with 6 inches for the concrete pole, while at 2200 pounds it was broken off about a yard from the ground.

CONGO, BELGIAN. A Belgian colony in Central Africa, formerly the Congo Free State, under the sovereignty of the King of the Belgians, annexed to Belgium by treaty of November 28, 1907, which was approved by the Belgian Parliament in August, 1908, and by the King on October 18 following. The capital is Boma (population, 3300), and the chief port Banana, at the mouth of the Congo. The estimated area is about 920,000 square miles. The population, which is of Bantu origin, is officially estimated at 20,000,000; other estimates are 9,000,000 and 15,500,000. In January, 1908, the white inhabitants numbered 2943. Gross fetishism is practiced by the natives, but mission work is carried on. The reported number of mission stations is 138, with 571

missionaries, of whom 350 are Catholic and 221 Protestant. Three colonies for agricultural instruction are maintained by the government.

PRODUCTION AND COMMERCE. The soil of Belgian Congo is divided into native lands, private estates of non-natives, and Crown lands. The leading commercial product is rubber; other products of importance are ivory, palm-nuts, palm-oil, coffee, cacao, bananas, tobacco, and white copal. Rubber and coffee plantations have been established by the government. In 1907 imports and exports were valued at 25,182,000 francs and 58,895,000 francs respectively; in 1908, 32,561,300 francs and 57,383,100 francs respectively. The principal imports are textiles, foodstuffs, beverages, and machinery and metal manufactures. Rubber is the chief export, being valued at 43,983,000 francs in 1907. The trade is mainly with Belgium.

COMMUNICATIONS. For about 100 miles from its mouth to Matadi the Congo is navigable, and eleven state steamers ply thereon. Thence a railway about 250 miles long extends to Stanley Pool, above which the river, exclusive of its great tributaries, is navigable for some 1200 miles. A Belgian company has a concession to build about 900 miles of railway connecting the Congo at Stanleyville and Nyangwe with Albert Nyanza and Lake Tanganyika, and a considerable mileage is already in operation. The Katanga Railway Co. has undertaken to build a line from Mabaya, on the Congo frontier, to the Star of the Congo copper mine (60 miles) upon the arrival of the Rhodesian railway to Mabaya from Broken Hill; thence the Belgian company is to continue the line eventually to the Ruwe copper district (170 miles further) and to the navigable Lualaba. A local railway in Mayumbe is in operation for 50 miles. In 1907 the post-offices numbered 25. There are about 1100 miles of telegraph line.

ARMY, NAVY, ETC. The native armed force in 1909 was divided into 23 independent companies of infantry under European officers, and amounted to 13,886 men, exclusive of European officers and members of the skeleton organization, in whose numbers were included 141 officers and 184 non-commissioned officers. There was also a reserve corps and four camps of instruction. Recruitment is by conscription and the contingent for 1909 was fixed at 2200. The time of service is seven years. There is an annual draft in the conscription to the construction of public works and a "second section," amounting to about 2500 men, are taken for this purpose.

GOVERNMENT, ETC. The legislative power is exercised by the King through decrees proposed by the Minister for the Colonies. The latter, who is a member of the Council of Ministers and president of the Colonial Council, is appointed by the King and is responsible to the Parliament. At Boma the King is represented by a governor-general (Baron Wahis in 1909) who is assisted by several vice-governors-general. For administrative purposes the colony is divided into fourteen districts, a commissioner being at the head of each. Revenue and expenditure in 1906 amounted to 34,623,782 francs and 28,847,281 francs respectively; in addition, however, there are reported extraordinary revenue of 32,876,465 francs and extraordinary expenditure of 38,-

233,133 francs. According to the revised budget of 1907, the revenue and expenditure stood at 40,895,299 francs and 40,191,797 francs respectively. For 1909 revenue was estimated at 36,094,036 francs, and expenditures 44,517,336 francs. The chief items of revenue were: Taxes in kind, 16,881,825 francs; customs, 7,200,000; transports, etc., 5,723,211. The public debt amounts to 117,974,000 francs. There is a native armed force (infantry) of about 15,000 men, whose commissioned officers are almost entirely Belgians. Recruitment is by conscription and to some extent volunteering, the annual contingent being about 2000 men. The term of service is five years in the ranks and two in the reserve. In addition to the soldiers, men are conscripted to serve as artisans in the construction of public works; these number about 2550.

HISTORY

CRITICISMS OF CONGO ADMINISTRATION. The chief events in the recent history of the Congo were the annexation of the state to Belgium by the treaty of October 18, 1908, and the passage in that year of the Colonial act arranging for the new administration. For several years past the alleged abuses in the Congo administration had occasioned continued criticism in foreign countries and protests from the governments of Great Britain and the United States. No guarantees were given on the occasion of the transfer of Congo sovereignty to Belgium in 1908 that the changes desired by the critics of the Congo administration and discussed in diplomatic correspondence by the United States and Great Britain would be introduced. In 1909 there was no improvement in the situation. In January, Germany and France formally recognized the annexation, but the United States and Great Britain still held back. Complaints continued that forced labor was still systematically employed and diplomatic correspondence was carried on at intervals without avail. In a British government publication issued January 29 the British consul at Boma drew attention to the oppressive and unfair system of taxation, charged one of the companies with total disregard of the regulations against wasting rubber resources and for the protection of the natives, and charged the government authorities with either blindness or actual connivance. Another consul declared the state of the natives under the concessionary companies to be no better than slavery and the outlook under present conditions hopeless. Both the American and the British governments gave it to be understood that they would not recognize annexation until they received more satisfactory assurances of reform. A dispatch from the United States Secretary of State early in February, acknowledging the receipt of the Belgian notice of annexation, emphasized the need of certain radical administrative changes. In the same month the Congo Reform Association submitted to Sir Edward Grey a report of the Rev. John Whitehead alleging cruelty to the natives and raids on their villages in punishment of their failure to bring products to the state stations, and complaining that in violation of the Berlin act the authorities were blocking all the educational efforts of the missionaries. On February 26 and on March 4 Sir Edward Grey again referred to his government's demand for

radical reforms and the fulfillment of treaty rights. In France an association has been formed for the reform of the Congo, and an International League was organized to coöperate with the French League for the defence of the Congo natives. Their joint policy was defined as follows: To work for the abolition of forced labor with the French League for the defense of the natives to trade freely in what they produce, to restore to the natives the land belonging to them that had been assumed by the state, to insist that the state shall protect native rights and customs and exploit vacant lands only in the interest of the natives, and to teach European nations the duty of developing native prosperity in the Congo.

In the Belgian Chamber the government was interpellated by two Socialist Deputies in regard to the decree authorizing forced labor on the Great Lakes Railway (see BELGIUM, paragraphs on *History*) and other public works, and a debate resulted (March 16). It was charged that under present conditions laborers were torn from their homes for a period of five years under threats of punishment, and it was asked why free labor was not established. To this the Colonial Minister replied that he had not violated the Colonial Charter, that the railway works were urgent and that the natives would benefit from them, and that conditions had improved in general; but he did not deny that the natives were still chained and that the chicote was still used. M. Vandervelde, one of the Deputies who interpellated the government on this occasion, referred to the sufferings he himself had seen during a recent visit to the Congo. At Welle, where the work on the Great Lakes Railway was going on, the natives were drafted from points at a distance of thirty days' journey. In a later debate the Ministry was accused of violating its promises, and it was demanded that the use of chains and the chicote should cease and that what practically amounted to a system of slavery should be abolished. The Ministry replied that forced labor was a characteristic of all colonies and was to be found on the railways of Lagos, Uganda, and Sierra Leone; that while the Congo administration was not ideal, it was the best possible under the circumstances. Forced labor, they declared, would eventually be abolished, but at present railway construction must be hastened. The Opposition urged the repeal of the decree authorizing forced labor issued on January 6. Later, the resolution passed the Chamber and was accepted by the Minister for the Colonies. It urged the substitution of free recruiting for recruiting on account of public utility in the construction of the Great Lakes Railway. It declared that improvements might be made in the condition of the laborer by reducing their length of service, limiting the recruiting zone, assuring equal pay and a proper local proportion of recruited labor to the free labor in the same region.

In a letter addressed to Sir Edward Grey, the secretary of the Congo Reform Association argued that if Belgium had kept its pledge the rubber output would have fallen to one-fourth of what it had been, whereas it promised to be nearly as large as before. This was offered as a proof that forced labor was still practiced. In the summer the official correspond-

ence between the British and Belgian governments and between the United States and Belgium was published. It contained the familiar complaints of the British and American governments as to disregard of native rights and the continuance of forced labor. The American Secretary of State insisted on the fulfillment of international obligations, with which he declared the system of forced labor to be incompatible. To this the Belgian government replied that international obligations were not disregarded, but that they could not all survive the annexation of the Congo by Belgium. As to concessionary rights Belgium declared that foreigners could still purchase all the land they wished and that the concessions did not debar the government from selling vacant lands in the concession districts. The United States government, it declared, misunderstood the situation, having confounded the particular territory of the tribes with the lands owned collectively by the tribesmen. Sir Edward Grey referred to the Congo Reform Association as an independent society, expressing strong popular feeling on the subject, which would endure until the reforms were assured. On March 15 Sir Edward Grey received the reply of the Belgian government, which, he said, was satisfactory in its general assurances, but not specific as to its measures of reform. The British reply on June 11 declared that Great Britain could not recognize the annexation till the abuses of taxation and forced labor had ceased. Reports of cruelty to the natives continued. At an executive meeting of the Congo Reform Association on July 7, chagrin was expressed at the reply of the British government and coöperation was urged with the United States toward solving the Congo problem. In July the archbishops of Canterbury and York, four bishops, and the moderators of the Church of Scotland and the United Free Church of Scotland signed a statement to the effect that the Congo situation was worse than ever and there was still to be found there "as cruel a tyranny as exists on earth." Two Protestant missionaries were tried at Leopoldville on September 17 on the charge of libeling the Kasai Company, but the judgment was rendered against the company. They were defended by M. Vandervelde, the Socialist leader in the Belgium Chamber, who had gone to the Congo for that purpose. On October 21, in a public address, Sir Edward Grey declared that his government could not recognize the annexation till it had received satisfactory replies to these two questions: "Is a great part of the native population still obliged to labor compulsorily for the greater portion of the year under the guise of taxation? And is the country still closed to trade?"

THE GOVERNMENT'S REFORM PLANS. On October 28 the Colonial Minister, M. Renkin, offered the colonial budget and outlined the government's reform scheme. He denied absolutely the charges of cruelty. During his recent visit he had questioned all who would be likely to know about it and had found no ground for the accusation. The authorities had investigated every abuse that was brought to their attention. The right of the state to the vacant lands assigned to it was incontestable, but having regard to native development the state would permit the natives to take the products raised on the lands of the Domain. On July

the state would open to freedom of trade the Lower Congo, Stanley Pool, Kwango, Ubangi, Bangala, Kasai, Katanga, Aruwimi, the southern part of the Eastern Province, and the banks of the Congo to Stanleyville; on July 1, 1911, an additional zone, and on July 1, 1912, the rest of the country. The government would abolish the provisioning of agents and impose its taxes in money. It would also investigate the arrangements made with concessionaries. Besides the ordinary estimates, extraordinary credits were asked for to the amount of 33,000,000 francs, of which the greater part was for public works requiring several years for completion. Smaller sums were to be spent in colonizing the Katanga region, reorganizing local administration and founding new centres of agriculture and stock-raising. When the new régime applies to these respective zones there will be no forced labor except on works of public utility and the natives will be authorized to cultivate the soil on their own account. The lands of the concessionary companies, however, are to be exempt from these rules and the government retains the right to make new arrangements with them. The government also proposed the increase of the native army. In Belgium the scheme was well received even by the most zealous of the reformers who had bitterly attacked the old system, and had been accused by its partisans of making common cause with the enemies of Belgium. The Socialist deputy, M. Vandervelde, who had been a caustic critic of King Leopold's administration, M. Beernaert, a staunch advocate of reform, and many other former critics, believed the Ministry sincere and the scheme as good a one as could in the circumstances be devised. In England, however, the Congo reformers continued to show distrust of the Belgian government. Their attitude throughout had caused much indignation among the Belgian reformers who had the same aim in view. At the beginning of December a protest signed by a number of prominent Belgians was addressed to foreign organs of government and learned bodies, setting forth this view and condemning "the attacks which Belgium has never deserved, and which she is convinced she can never deserve in the future, being fully aware, as she is, of her moral responsibility to the civilized world." On November 9, Mr. Asquith, the British Premier, declared that although the government had not had time to consider the matter fully, he welcomed the Belgian proposals as offering a more hopeful prospect than had hitherto appeared.

CONGO, FRENCH. See FRENCH CONGO.

CONGO FREE STATE. See CONGO, BELGIAN.

CONGREGATIONALISM. A term applied to a body of Christian believers, the rise of whose organized church life began with the Puritan movement, in England, during the latter half of the sixteenth century. They were first called Separatists, because they removed themselves, for worship after their simple forms, from the Church of England. They were sometimes called Independents. Religious bodies, independent of organized ecclesiasticism, have existed from the earliest days of Christianity. The Congregationalists in the United States constitute the eighth largest

religious body. On December 31, 1908, there were reported 719,195 members.

For the direction of its various affairs, Congregationalism in the United States is organized as follows: First, in Local Associations, in which the churches are represented by pastor and delegates; second, State Conferences, in which Local Associations are represented by delegates, and churches by pastors and delegates; third, National Council, which is constituted by the State body sending one delegate, and an additional number of delegates in the ratio of one to every ten thousand communicants, and one for every major fraction thereof; also, delegates from Local Associations, one for every ten churches, and one for every major fraction thereof. Local and State bodies usually meet annually. The National Council meets once in three years, and with it the Benevolent Societies hold their annual meetings. The Council has no authority whatever, and does not legislate for the churches. Its recommendations, however, are, according to their wisdom, cordially accepted and generally adopted by the churches.

In recent years the tendency of the churches has been toward federation; that is, the churches have become more closely related in fellowship—a fellowship of service; and have sought to be concentrated upon certain well-defined ends in which they are interested. The several national societies for benevolent work, instead of being independent organizations, as they once were, are now organized in representative capacities. Virtually the control of these societies is in the hands of the churches.

At the National Council in Cleveland, Ohio, 1907, the Committee on Polity emphasized the necessity and importance of a closer federation of Congregational churches, in which the autonomy of the local church should be respected, while at the same time a more compact organization of the entire body could be directed to well-defined purposes. In all probability, it will be reported at the next session of the National Council that the suggestions of the Committee on Polity have, in the main, been adopted.

The educational and missionary work of the churches is carried on under the auspices of the following societies: The American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Association, the Congregational Education Society, the Congregational Sunday School and Publishing Society, and the Congregational Board of Ministerial Aid. All these societies, except the last, which is under the control of the National Council, are representative in their constituencies, although they were at first organized as independent societies. The women of the church are well organized in foreign and home missionary work. There are smaller societies which are distinctly Congregational, such as the Boston Seamen's Friend Society. For fellowship and culture, clubs are organized. There are over fifty such bodies in the several States. Ministers find for themselves mutual help and improvement in associations. Ministers receive license, in some States from Conferences, and in others from Associations. Ordinations and installations are carried out through Ecclesiastical Councils, convened by letter missive from the church by which such services are desired.

The following summaries give the figures for Congregationalism in the United States, January 1, 1909: Churches, 6006; ministers, 5924; members, 719,195; Sunday school scholars, 692,809; families, 511,542. Contributed to Foreign Missions, \$528,249; Home Missions, \$537,788; American Missionary Association, \$141,560; Church Building Society, \$97,078; Education Society, \$199,637; Sunday School Work, \$64,468; Ministerial Aid, \$32,539; other benevolences added give a total of \$2,359,228; \$8,921,807 was spent in parish support. Church property (total) was estimated at \$64,886,605. The total amount of salaries paid exceeded \$4,321,916, making an average salary of \$907.

The theological seminaries are: Andover, Cambridge, Mass.; Atlanta, Ga.; Bangor, Me.; Chicago, Ill.; Hartford, Conn.; Oberlin, Ohio; Pacific, Berkeley, Cal.; Yale, New Haven, Conn. Forty colleges exist to-day which were founded by Congregationalists. A few of these colleges are unsectarian and independent, for which cause an advantage is taken of the Carnegie Foundation. These colleges enroll 25,182 students, under 1868 instructors; include 1,712,701 volumes in their libraries, and hold productive funds to the amount of \$26,941,466.46. The next session of the National Council will be held in Boston, Mass., October, 1910. The officers are: Hon. Thomas C. MacMillan, Chicago, Ill., Moderator; Rev. Asher Anderson, D.D., Boston, Mass., Secretary; Rev. Joel S. Ives, Hartford, Conn., Registrar and Treasurer.

The Congregationalists in foreign countries numbered on January 1, 1909, 643,172, of whom 459,147 were in England and Wales, 35,920 in Scotland, 35,920 in South Africa, 17,565 in Japan, and the remainder in other countries of Europe, Asia, Africa, and in Australia.

CONGREGATIONAL METHODIST CHURCH. A Protestant religious denomination, which was founded in 1852 in Georgia by those who had withdrawn from the Methodist Episcopal Church and desired to establish a church of Methodist doctrine, but giving the members a choice in their own government. The denomination had in 1909 15,529 communicants, 333 churches, and 337 ministers. Its strength is greatest in the Southern States. The Thirteenth Annual Conference was held at Anniston, Ala., November 19, 1909. In 1909 a union was effected with the United Methodist Churches of Arkansas, and with the Congregational Methodist Church North. The denomination maintains a publishing house at Atlanta, Ga., from which is issued its official organ, *The Watchman*, and other denominational publications. There is maintained a Bible school at Atlanta, together with a Bible Training School, Interstate College and a Music Institute. The denomination has shown considerable growth in recent years.

CONGRESS. See UNITED STATES.

CONNECTICUT. One of the New England Division of the United States and one of the thirteen original States. It has a total area of 4990 square miles, of which 4845 square miles are land, and 145 square miles water. The population in 1900 was 908,420. According to a Federal estimate made in 1909 the population in that year was 1,054,366. The capital is Hartford.

MINERAL PRODUCTION. The valuable mineral products of the State are limited to build-

ing stone. There are certain deposits of iron which have been worked in recent years, but the developments are not important. The value of the stone product in 1908 was \$1,125,799, as compared with a value of the product for 1907 of \$1,052,582. Of this product granite was valued at \$592,904; trap rock at \$473,219; sandstone, \$55,949; and limestone, \$3227. Connecticut ranks seventeenth among the States in the production of stone. The value of the mineral products of the State for 1908 was \$2,721,663, as compared with a value of the product for 1907 of \$3,389,519.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$2,981,720. Of this product oysters were the most valuable. Of these there were taken for market purposes 1,394,600 pounds, valued at \$1,167,650, and for seeding purposes, 2,553,500 pounds, valued at \$1,415,290. Next in order of value were menhaden, 28,630,000 pounds, valued at \$93,350; lobsters, 661,300 pounds, valued at \$84,280; cod, 820,300 pounds, valued at \$26,720; flatfish and flounders, 707,100 pounds, valued at \$21,260; swordfish, 240,100 pounds, valued at \$14,800. Among other fish taken were alewives, mackerel, shad, weakfish, clams and eels. There were 952 independent fishermen engaged in fishing in different parts of the State, and 1195 wage-earning fishermen were employed. The vessels engaged in fisheries numbered 237, and were valued at \$795,364. The cash capital invested in the fisheries of the State was \$572,290.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the important farm crops of the State in 1909 were as follows, according to figures of the United States Department of Agriculture: Corn, 2,460,000 bushels, valued at \$1,845,000, from 60,000 acres; oats, 302,000 bushels, valued at \$160,000, from 11,000 acres; rye, 187,000 bushels, valued at \$168,000, from 10,000 acres; buckwheat, 58,000 bushels, valued at \$58,000 from 3000 acres; potatoes, 4,320,000 bushels, valued at \$3,586,000, from 36,000 acres; hay, 564,000 tons, valued at \$10,885,000, from 490,000 acres; tobacco, 22,110,000 pounds, valued at \$3,648,150, from 13,400 acres. The corn, potatoes and tobacco grown in the State have shown a noteworthy increase in acreage since 1900. The potato crop of 1909 was much larger than that of 1908. In the latter year 2,720,000 bushels were raised. The acreage increased from 34,000 in 1908 to 36,000 in 1909. The hay crop showed a slight decrease in 1909, the figures for 1908 being 588,000 tons. The acreage, however, remained the same. The tobacco also showed a considerable decrease in production, the crop of 1908 having been 23,224,320 pounds. The acreage in 1909 showed a slight decrease. Only six States exceeded Connecticut in the total value of the tobacco raised. The number of farm animals in the State has remained practically constant since 1900, except for a considerable increase in the number of milch cows and sheep, the former numbering 187,000 and the latter 47,000, on January 1, 1910. The wool clipped in 1909 was 138,000 pounds.

EDUCATION. According to the report of the State Board of Education the number of children in the State between the ages of 4 and 16 on October, 1908, was 234,117. Of these there were enrolled in the common schools 183,785, an increase of 4608 over the previous year.

The average daily attendance was 139,646, the number of schoolhouses in the State, 1557, and the value of the public school property was \$16,582,824. The men teachers numbered 329 and the women teachers, 4696. The average monthly wage of men teachers was \$115.07 and of women teachers \$50.50. The total revenue for the purpose of education from all sources was \$5,027,877, and the expenditures were \$4,968,699.

FINANCE. The total yearly receipts for the fiscal year 1909 amounted to \$5,617,903, and the total expenditures to \$5,882,725, making expenditures in excess of receipts \$264,822. The expenditures in excess of receipts in 1908 amounted to \$816,056. The funded debt at the close of the year 1909 was \$1,874,100, and the net debt was \$2,013,407.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the Connecticut State Prison at Wethersfield, the Connecticut School for Boys at Meriden, the Industrial School for Girls at Middletown, the House of the Good Shepherd at Hartford, the Florence Crittenton Mission at New Haven, the Connecticut Hospital for the Insane at Middletown, the Norwich Hospital for the Insane at Norwich, and the Hartford Retreat at Hartford. Among the schools for various classes are the School for Imbeciles at Lakeville, public hospitals in various cities, and the county institutions for indigent and others. The number in the jails of the State September 30, 1908, was 1235. The expenditures for county jails were \$96,658. In the Connecticut School for Boys there were, October 1, 1908, 430 inmates, and in the Connecticut Industrial School for Girls, 272. The number of insane persons under restraint in the State September 30, 1908, was 3603.

POLITICS AND GOVERNMENT. Governor George L. Lilley, who was elected in November, 1908, and inaugurated on January 6, 1909, died April 21, 1909, broken down, it was said by his friends, by the strain of his campaign and the responsibilities of office. The legislature came together Wednesday, January 6, and did not finally adjourn until the 24th of August. On the 20th of January, Frank B. Brandegee, of New London, was re-elected U. S. Senator, having carried the Republican caucus by 126 votes, against 111 cast for Congressman E. J. Hill, of Norwalk. The most important acts of Governor Lilley's administration consisted of his judicial appointments, which were: Frederick B. Hall of the Supreme Court to be Chief Justice after February 5, 1910, Samuel O. Prentice, of Hartford, reappointed to the supreme bench, Silas A. Robinson, of Middletown, and George W. Wheeler, of Bridgeport, promoted from the Superior to the Supreme Court; and, as judges of the Superior Court: George W. Wheeler, reappointed until his Supreme Court service should begin, Ralph Wheeler, of New London, reappointed, Edwin B. Gager, of Derby, reappointed, William S. Case, of Hartford, reappointed, Milton A. Shumway, of Killingly, reappointed; and new appointments: Lucien F. Burpee, of Waterbury and William H. Williams, of Derby. Governor Lilley was succeeded by the Lieutenant-Governor, Frank B. Weeks, of Middletown, and he appointed to the Superior Court, Gardiner Greene, of Norwich, and Marcus H. Holcomb, of Southington. Agitation in the General Assembly centred

largely upon the proposal for a public utilities commission, an employers' liability act and removing the \$5000 limitation for death of a human being. All three of these movements failed. Owing to heavy expenses for public buildings and good roads the State tax, omitted for many years, was levied by this General Assembly. A reformatory, for which \$400,000 was appropriated, was ordered to be established. On the 12th of August it was voted to defer to the next legislature action on the proposed income tax amendment to the Federal Constitution.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Bills were passed concerning the sale of adulterated foods, the employment of women and children, tuberculosis and blacklisting.

OFFICERS: Governor, Frank B. Weeks; Lieutenant-Governor, office vacant; Secretary of State, Matthew H. Rogers; Treasurer, Freeman F. Patten; Comptroller, Thomas D. Bradstreet; Attorney-General, Marcus H. Holcomb; Commissioner of Insurance, Theodore H. Macdonald—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Simeon E. Baldwin, Democrat; Associate Justices, S. O. Prentice, Republican; F. B. Hall, Republican; John M. Thayer, Democrat; Alberto T. Roraback, Republican; Clerk, George A. Conant.

The State Legislature was composed in 1909 of 31 Republicans and 4 Democrats in the Senate, and 199 Republicans and 51 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article *UNITED STATES*.

CONNELL, JOHN. A former United States Senator from California, died January 9, 1909. He was born in 1821, in Ireland. He came to the United States at the age of fourteen, and became apprentice to a piano maker. In 1849 he went to California as a gold seeker, and there became active in politics. He was candidate for Governor in 1861, and in 1862 was elected United States Senator. Largely through his efforts California was saved from seceding from the Union. He was a friend and admirer of Lincoln, and acted as a pall-bearer at the latter's funeral. Senator Connell was among the first to urge the building of a transcontinental railroad. Following the expiration of his term in the Senate he settled in Dorchester, Mass.

CONRIED, HEINRICH. An American impresario and theatrical manager of Austrian birth, died April 27, 1909. He was born in Bielitz, Austria, in 1855. His earliest ambition was to become an actor, and after several years of commercial life he became supernumerary in the Burg Theatre, Vienna. He acted in various parts until 1877, when he undertook the management of the Stadt Theatre, in Bremen, which had become bankrupt. In this enterprise he was successful, and in the following year he was engaged to come to New York to manage the Germania Theatre. He remained in this position for two years, then traveled as a star in cities where German drama was supported. In 1882 he became manager of the Thalia Theatre, in New York City. His artistic success was great, but the financial support was lacking, and Conried turned to the production of comic opera in English. In 1892 he succeeded Gustave Amberg as manager of the

Irving Place Theatre in New York City. His success in this was so great from an artistic standpoint that when Maurice Grau retired from the management of the Metropolitan Opera House, Mr. Conried was, in 1903, made his successor, and a company was formed to give him financial support. Under Mr. Conried's management the first production of *Parsifal* outside of Germany was given on December 24, 1903. Among other important productions and revivals made by him were *The Queen of Sheba*, *Die Fledermaus*, and *Hansel und Gretel*. In the season of 1905-6 Mr. Conried attempted an elaborate production of Strauss's *Salome*. After its first performance, it was removed by the lessees of the Metropolitan Opera House. Great losses were entailed by the Opera Company in the San Francisco fire of 1906. These unfortunate occurrences undermined Mr. Conried's health, and illness overcame him in December, 1906, but he continued his management of the opera season in 1907-8, although he was, for the greater portion of the time, unable to take an active part. His death occurred in Munich, while he was traveling for the benefit of his health.

In addition to his management of the Metropolitan Opera House, Mr. Conried was one of the most active supporters of the New Theatre, in New York City, and it was generally understood that he was to be its manager on the completion of the enterprise.

CONSERVATION ASSOCIATION, NATIONAL. An association organized in 1909, for the purpose of calling the attention of the people of the United States, and of their official representatives, to the imperative need for the wise development and protection of the country's natural resources. The Association was formed largely as a result of the conference of governors convened by President Roosevelt in the White House at Washington on May 13, 14 and 15, 1908. Its general objects are to advocate and support the adoption by the people themselves, and by their representatives, of definite and practical measures to carry the principles established at this conference into effect, and to oppose in all appropriate ways all action which is in conflict with these principles, whether such action is attempted by individual citizens or by legislative or administrative officials. Among the measures advocated by the Association are the following: The protection of the source waters of navigable streams, through the purchase or control by the nation of the necessary land within their drainage basins, especially in the Southern Appalachians and White Mountains; the enactment and enforcement, both by the nation and by the several States, of effective laws to prevent by active patrol during dry weather, and by other appropriate means, the spread of fire in all forests, whether publicly or privately owned; the reasonable but effective regulation of timber cutting on forest land, whether publicly or privately owned, the conservation of which is essential to the public welfare; the separation for purposes of taxation of the timber from the land on which it grows, so that the forest crop shall be taxed only when it is harvested, while the soil shall be taxed every year; and the support and extension of practical forestry.

The Association also advocates the preparation by a commission appointed by the President of the United States of a comprehensive

plan for waterway improvement, extending to all the uses of the waters and the benefits to be derived from their control, including navigation, with the relation of railroads and terminals thereto, the development and disposition of water power, the irrigation of arid lands, the drainage of swamp and overflowed lands, the prevention of soil-wash and the purification of streams for water supply. It urges the immediate undertaking and continuous prosecution of works clearly necessary under such general plan.

As regards public lands the Association urges the directing of public attention to the need for preserving the fertility of the soils, the enactment of legislation whereby the title to the surface of public lands, and to the minerals therein, shall be granted separately, with every appropriate facility for miners to acquire such part of the surface as may be needed in the development of their claims, and the conservation and control of the unappropriated public range lands by the government in the interests of the stockman and homemaker, and subject at all times to homestead entry. The Association is in favor of the retention by the government of the title to all lands still in public ownership which contain phosphate rock, coal, oil or natural gas, and the development of the same by private enterprise under conditions which will prevent extortion and waste, and the enactment of appropriate legislation to prolong the coal supply, to reduce waste in mining, and to establish safeguards against the loss of life in the mines. The Association organized during the year several State committees. Its national headquarters are in New York City, and it also has offices in Washington. By bulletins and otherwise, it seeks to keep members well informed of its work. Its officers in 1909 were: President, Charles W. Eliot; Vice-President, Walter L. Fisher; Treasurer, John F. Bass; Secretary, Thomas R. Shipp; Director, Royal L. Melendy. The Executive Committee is composed of Charles W. Eliot, James R. Garfield, John F. Bass, Henry L. Stimson, Walter L. Fisher, Bernard N. Baker, Charles L. Pack and Joseph N. Teal. The general offices of the Association are in the Fifth Avenue Building, New York City.

CONSERVATION OF MASS. See CHEMISTRY.

CONSERVATION OF NATIONAL RESOURCES. See AGRICULTURE; FORESTRY; LANDS, PUBLIC; NATIONAL CONSERVATION ASSOCIATION; NATIONAL CIVIC FEDERATION; United States, section ADMINISTRATION.

CONSTRUCTION, BUILDING. See ARCHITECTURE.

CONVERSE, GEORGE ALBERT. An American rear-admiral, died March 29, 1909. He was born at Norwich, Vt., in 1844, and graduated from the United States Naval Academy in 1865. From 1865 to 1867 he served on the European squadron, and from 1869 to 1872 was on torpedo service. He was made lieutenant-commander in 1878, commander in 1889, captain in 1899, and rear-admiral in 1904. From 1899 to 1901 he was on service in the Bureau of Navigation, and from 1901 to 1903 commanded the battleship *Illinois*. He was chief of the Bureau of Equipment in 1903-4, chief of the Bureau of Ordnance from March 15 to August

1, 1904, and in the latter year was made chief of the Bureau of Navigation.

COOK, FREDERICK ALBERT. An American physician and explorer, who made a claim, which remained unsubstantiated, of having discovered the North Pole on April 6, 1907. See POLAR EXPLORATION.

COOK ISLANDS. See NEW ZEALAND.

COOKSON, BRYAN. An English astronomer, died September 13, 1909. He was born in 1874, and graduated from Magdalen College, Oxford, in 1896. After a tour around the world he took a post-graduate science course at Cambridge. While there he designed a new form of floating photographic zenith telescope for making original investigations on change of latitude and the constant of aberration. He spent two years at the Royal Observatory at the Cape of Good Hope, and there made valuable studies in the determination of the mass of Jupiter and the elements of the orbits of the satellites of that planet. Returning to Cambridge he erected his zenith telescope, and completed a series of observations with that instrument. The results of these have not yet been published. Dr. Cookson was considered one of the most promising of the younger school of astronomers.

COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART. An institution founded in New York City, for free instruction in science and art, by Peter Cooper, and chartered in 1857. The Institute includes the following departments: Day School of Technical Science; Night School of Science; Night School of Art; Woman's Art School; School of Stenography and Typewriting; School of Telegraphy; School of Elocution; School of Oratory and Debate, and Parliamentary Procedure; Reading Room and Library, and the Museum for the Arts of Decoration. Cooper Union has developed so rapidly in recent years that it has outgrown its original building in Cooper Square, and efforts have been made to add to its facilities by the erection of new buildings. A site occupied by the Sixty-ninth Regiment Armory, directly opposite, has been acquired, but funds have hitherto been lacking for the erection of a building. With the erection of this building, accommodation would be provided for a student body of 5000. During the year 1908-9 the total attendance was 3136, distributed as follows: Night School of Science, 1308; Night School of Art, 1126; Day School of Technical Science, 294; Woman's Art School, 323; School of Stenography and Typewriting for Women, 55; School of Telegraphy for Women, 30. The total number of books in the library is 47,788. The total revenue of Cooper Union for the year beginning January 1, 1909, was \$156,005, and the expenditures were \$152,983. The endowments amount to \$3,979,295. The officers in 1909 were: President, John E. Parsons; Secretary, R. Fulton Cutting; Treasurer, Edward R. Hewitt.

COPPER. The statistics with regard to the production of copper in 1908 in the different States in which it is mined, together with the available estimates for the production of 1909, will be found in the paragraphs on *Mineral Production* in the articles on these States. In this article the statistics are general in their nature.

The commercial conditions of the copper industry during 1908 were much more stable than in 1907. The variation in monthly averages of New York quotations was only 1.54 cents, as compared with 11.19 cents in 1907. As compared with prices for the years immediately preceding the price of copper remained low throughout the year, although it was almost exactly the same as the average price for the twenty-five years from 1883 to 1907. The average price for 1908 was 13.20 cents, and that for the preceding period of twenty-five years was 13 to 13.25 cents. Large stocks of copper were on hand at the beginning of the year, although several important producers were restricting their output. Other companies, however, were making their normal production, or even increasing their output in order to reduce cost. A notable feature of the industry for the year was the decrease in the cost of production, brought about by a general policy of economy in operation, and, especially, by an increased efficiency of labor. An important event early in 1909 was the formation of the Copper Producers' Association, which includes all the leading producers of the country. Its object is to collect and give out accurate information relative to the production, export and domestic consumption of copper.

The production of copper in 1908 by smelters from copper-bearing materials from the United States was 942,570,721 pounds, as compared with 868,996,491 pounds in 1907, and 917,805,682 pounds in 1906. The production in 1908 was the largest in the history of the industry. The mines producing copper in 1908 reported 956,840,578 pounds, or 14,269,857 pounds more than the smelters. This discrepancy is caused by the fact that a number of the small operators report the copper in their ores on the basis of commercial assay. Considerable copper is also recovered by the smelters from ores that are treated primarily for other metals. At the close of the year there were known to be 17,800,000 pounds of copper in the form of ore and concentrates in storage at the smelters in excess of the quantity at the beginning of the year, and the actual quantity was probably still greater.

Twenty-four States and Territories contributed to the copper production of 1908. Three leading copper States, Arizona, Montana and Michigan, produced 81 per cent. of the total output of 1908, as compared with 80 per cent. in 1907. The five leading States, including Utah and California, produced nearly 93 per cent. of the output in 1908, as compared with 92 per cent. in 1907.

The refinery output of the United States came in 1908 from fourteen plants, nine of which employed electrolytic methods, and five employed the furnace process on Lake Superior copper. The total production of refined new copper for 1908 was 1,094,700,123 pounds, the largest output in the history of the industry, exceeding the 1906 production of 1,079,052,479 pounds, and the 1907 output of 1,032,516,247 pounds.

The apparent consumption of refined new copper in the United States in 1908 was about 480,000,000 pounds, as compared with 488,000,000 pounds in 1907. To the apparent consumption of new copper should be added that produced from secondary sources, a large part of which entered into the year's consumption.

This amounted to about 23,000,000 pounds in 1907.

The average quoted price of electrolytic copper in 1908 was 13.2 per pound. In 1907 the price was 22 cents per pound.

The quantity of copper in manufactured form imported into the United States in 1908 was 218,705,487 pounds. Of this the largest amount was imported from Mexico, with British North America second. The exports of metallic copper from the United States in 1908 were 661,876,127 pounds. This is the largest export made in any year. The largest quantity was taken by the Netherlands, with Germany second and Great Britain third. The following table shows the world's production of copper by countries in 1907-8:

WORLD'S PRODUCTION (SMELTER OUTPUT) OF COPPER IN 1907 AND 1908, IN POUNDS

Country	1907	1908
Algeria	156,800
Argentina	492,800	504,000
Australasia	92,400,000	88,480,000
Austria	2,060,800	3,528,000
Bolivia	5,600,000	5,600,000
Canada	57,377,600	63,996,800
Cape Colony	9,475,200	15,411,200
Chile	59,774,400	85,825,600
England	1,568,000	1,568,000
Germany	45,897,600	45,248,000
Hungary	280,000	224,000
Italy	7,392,000	6,664,000
Japan	109,614,400	96,320,000
Mexico	126,705,600	84,156,800
Namaqualand	5,800,000
Newfoundland	3,875,200	3,203,200
Norway	16,702,400	20,555,600
Peru	23,688,000	33,600,000
Russia	33,600,000	44,990,400
Spain	111,272,000	117,790,400
Portugal
Sweden	4,480,000	4,480,000
Turkey	2,800,000	2,352,000
United States	868,996,500	942,570,000
Total	1,589,809,300	1,667,098,000

Statistics and estimates received by the United States Geological Survey from all plants known to produce blister copper from domestic ores, and from all lake mines, indicate that the copper output from mines in the United States in 1909 surpassed all previous records.

According to these estimates the output of blister and lake copper was 1,117,800,000 pounds as against 942,570,721 pounds in 1908, an increase of over 18 per cent. This not only exceeds the increase of any previous year, but is considerably greater than the total yearly increase since 1904. Montana shows a large increase, again taking first rank, which it lost to Arizona in 1907. The production in Montana will nearly equal or will possibly exceed the State's previous record output of 314,750,000 pounds made in 1905: Arizona holds second place with a slight increase. Michigan also exceeded the 1908 production. Large gains were made by Utah and Nevada, and California increased its output considerably. The figures published by the Copper Producers' Association indicate that the production of copper from all sources, domestic and foreign, for the first eleven months of 1909, exceeded 1,400,000,000 pounds, as against 1,161,176,085 pounds in 1908. Estimates at the end of the year indicated that the exports of copper surpassed by several million pounds the exports

for 1908, while the imports amounted to about 311,800,000 pounds, as compared with 218,705,487 pounds in 1908. Stocks of refined copper in the United States at the end of the year showed a considerable increase over those of January 1, 1909, but the accumulation occurred for the most part during the first half of the year. The price of copper remained close to 13 cents throughout the year, the average monthly New York quotation for electrolytic copper being a little under 13 cents.

According to the estimates of the *Engineering and Mining Journal* the production of refined copper in the United States in 1909 was, in round numbers, 1,410,000,000 pounds against 1,153,000,000 pounds in 1908. These figures represent the total production of American refineries which draw supplies of raw material, not only from the United States, Canada and Mexico, but also from many foreign countries. The same authority estimates the total domestic deliveries of refined copper for the year at 704,070,892 pounds, as against 488,500,000 pounds in 1908, and 538,000,000 pounds in 1907. The demand for copper in Germany improved materially in 1909, and in France business became fair. It was only in Great Britain that the demand continued sluggish. The tables below, taken from the *Engineering and Mining Journal*, give the production of copper by States in 1908-9, and the consumption of copper in the same years.

PRODUCTION OF COPPER BY STATES

State	1908	1909
Alaska	4,394,887	4,474,203
Arizona	290,167,795	291,075,846
California	36,890,353	53,048,094
Colorado	13,896,659	10,408,823
Idaho	8,749,559	8,168,267
Michigan	222,267,444	227,019,646
Montana	252,558,330	315,090,341
Nevada	12,174,269	50,820,000
New Mexico	8,523,652	7,001,136
Utah	70,978,952	105,349,740
Wyoming	2,384,356	100,000
South and East (a)	20,822,368	21,524,333
Other States (b)	4,387,836	4,206,999
Total	948,196,490	1,098,287,425

(a) Includes Vermont, New Hampshire, Pennsylvania, Virginia, North Carolina, Alabama and Tennessee. (b) Includes Washington, Oregon, South Dakota, Texas, Missouri, and the production of the lead desilverizers and others which it is impossible to distribute according to place of origin.

CONSUMPTION OF COPPER

	1908	1909
Stock Jan. 1.....	119,852,871	122,357,266
Imports of refined.....	n/a	n/a
Production	1,152,895,019	1,410,116,663
Total supply	1,272,747,890	1,532,473,929
Exports	661,876,127	680,235,945
Remaining in U. S.	610,871,763	852,187,984
Stock Dec. 31.....	122,357,266	148,117,092
Delivered for consumption	488,514,497	704,070,892

The table on page 186, taken from the *Engineering and Mining Journal*, gives the average price of electrolytic and lake copper in New York and London in 1908-9 by months.

	New York		Lake		London	
	Electrolytic	1908	1908	1909	1908	1909
January	13.726	13.893	13.901	14.280	62.386	57.688
February	12.905	12.949	13.098	13.285	58.786	61.198
March	12.704	12.387	12.875	12.826	58.761	56.231
April	12.743	12.564	12.928	12.931	58.331	57.363
May	12.598	12.693	12.788	13.238	57.387	59.338
June	12.675	13.214	12.877	13.548	57.842	59.627
July	12.702	12.880	12.933	13.363	57.989	58.556
August	13.462	13.007	13.639	13.296	60.500	59.393
September	13.388	12.870	13.600	13.210	60.338	59.021
October	13.354	12.700	13.646	13.030	60.139	57.551
November	14.130	13.125	14.386	13.354	63.417	59.917
December	14.111	13.298	14.411	13.647	62.943	59.906
Year	13.208	12.982	13.424	13.335	59.902	58.732

New York, cents per pound. Electrolytic is for cakes, ingots or wirebars. London, pounds sterling, per long ton, standard copper.

COPPINGER, JOHN JOSEPH. An American army officer, died November 4, 1909. He was born in County Cork, Ireland, in 1834 and was educated in private schools. He served in the Roman army in Italy, and was made Chevalier for gallantry at La Roca in 1860. In 1861 he came to the United States and was commissioned captain of the 14th infantry in the same year. He served throughout the Civil War, and in 1865 became colonel of the 15th New York Cavalry. He was mustered out of the volunteer service in 1865, and was transferred to the 23rd infantry. He was promoted to major of the 10th infantry in 1879; lieutenant-colonel of the 18th infantry in 1891; brigadier-general in 1895, and major-general of volunteers in 1898. He was twice brevetted for gallantry and meritorious services during the Civil War. He took part in campaigns against the Indians in 1866, 1867 and 1868, and for his services was brevetted colonel. During the beginning of the Spanish-American War, he was appointed major-general of volunteers and placed in command of the 4th army corps, which assembled at Mobile, and afterwards established headquarters at Tampa, Florida. It was not, however, called upon to leave the United States. In October, 1898, he was placed on the retired list as brigadier-general on account of age. In 1883 General Coppering was married to Miss Alice Blaine, daughter of the late James G. Blaine.

COQUELIN, ALEXANDRE HONORE ERNEST. A French actor known as Coquelin Cadet to distinguish him from his older brother, Benoit-Constant (see below), died February 8, 1909. He was born at Boulogne-sur-Mer in 1848. His parents destined him to follow their own trade of baking, but in 1864 he obtained entrance into the dramatic school of Regnier, where his brother received his early training. He took a prize for comedy at the Conservatoire in 1867, and in 1868 made his début with Constant at the Théâtre Français. Failing to be chosen a sociétaire, he acted at the Variétés, but in 1876 returned to the Français, of which, in 1879, he was made a sociétaire. Although lacking the genius of his elder brother, Coquelin Cadet was a comedian of rare talent. His remarkable aptitude in delivering monologues and soliloquies made him one of the most sought after artists in the most famous salons. Among the plays in which he appeared with the greatest success were: *Le Bourreau des Cranes*, *Les Trois Epiciers*, *Denise*, *M. Scapin*, *Margot*, *La Vie de Bohème*, and *Célimare le Bien Aimé*. His last public appearance was in October, 1907. Coquelin Cadet wrote many humorous pieces for the Parisian press.

COQUELIN, BENOIT-CONSTANT. A French actor, died January 27, 1909. He was born, the son of a baker, in Boulogne, in 1841. He early showed a disposition toward the theatre, and in 1859 he became a pupil of M. Regnier, at the Paris Conservatory. From the very beginning his great talent was evident. In less than a year he had won the second prize for comedy and had made his first appearance at the Théâtre Français as "Gros-Rene" in *Le dîpit amoureux* (December 7, 1860). By his thirtieth year Coquelin was well established as one of the leading actors in Paris, and was a sociétaire of the Français. His first successes were in classic plays, such as *Les Plaiseurs*, *Les Fourberies de Scapin*, *Le Mariage de Figaro* and *Don Juan*. His tendency grew, however, toward modern drama, and he made notable successes in *L'Aventurière*, *L'Estrangère*, and *Les Fourchambault*. During this period he was under contract with the Théâtre Français, but as his fame grew he became impatient with the restraint imposed upon him, especially with the provision compelling him to appear solely at that theatre or forfeit the pension to which he was entitled. As a result of these conditions, Coquelin withdrew from the Théâtre Français and returned only after a compromise had been reached in 1889. This provided that for six months in the year he should act at the Théâtre Français, and that in the remaining six he should be free. This arrangement continued until 1892, when Coquelin finally severed his connection with the Français. His first visit to the United States took place in 1888, when he was accompanied by Mme. Jane Hadling. He acted again with her in this country in 1894, and in 1900-1 with Mme. Sarah Bernhardt in *L'Aiglon*, *Cyrano de Bergerac*, and other plays.

Coquelin's talents lay especially in comedy rôles. He was a master of character acting, and his representations were remarkable for their technical finish. He had wonderful powers of elocution and infinite histrionic skill. He was unrivaled in classic French comedy, and was almost equally effective in romance and melodrama. In the interpretation of pathos and the deeper passions, his limitations were evident. His chief parts, in addition to those noted, were in *La Tosca*, *Malade imaginaire*, *La visite de noces*, and *Florence de Rantzen*. Coquelin wrote extensively on matters connected with the stage.

CORBIN, HENRY CLARK. An American army officer, died September 7, 1909. He was born in Clermont county, Ohio, in 1842. His boyhood days were spent on a farm, and he gained only the education offered by the public

schools of the period. He was teaching school when Lincoln's second call for troops came, and he was appointed a second lieutenant in the Seventy-ninth Ohio Volunteers, commanded by Rutherford B. Hayes, afterwards President. During the War he served at the headquarters of the Department of Ohio, with the Army of the West, the Army of the Cumberland, and with General Steadman's division of General Thomas's army. He took part in many battles and was brevetted brigadier-general at the close of the war. After the war had ended it was Corbin's intention to study law and he returned to Ohio for that purpose. He was, however, persuaded by General Grant to accept a commission of second lieutenant in the regular army in 1866. His promotion was rapid and in 1869 he was made a major and assistant adjutant-general. He saw service in the field in the Fenian disturbances, and in campaigns against the Apaches, Sioux and Moquis in the Southwest. He was made lieutenant-colonel in 1889, colonel in 1896, and brigadier-general and adjutant-general of the army in 1898, major-general in 1900, lieutenant-general in April, 1906, and retired in September of the latter year. General Corbin, as adjutant-general, was really in command of the army during the Spanish-American War, and the power given him by President McKinley caused much jealousy on the part of high army officers who considered themselves displaced. As adjutant-general, Governor Corbin introduced many reforms which resulted in the improved efficiency of the army. Congress made him major-general in recognition of his services in the Spanish-American War. The reorganization of the General Staff in 1902 lessened General Corbin's powers, and he was assigned to the Department of the East. In 1904 he was sent to command the army in the Philippines, and his work there was highly commended. In 1906 he was made lieutenant-general of the army, the highest rank given in recent years. General Corbin took a great interest in Ohio politics, and had a large influence with the political leaders of that State.

CORINTH, EXCAVATIONS IN. See ARCHAEOLOGY.

CORN. In general a most satisfactory crop of corn was produced in 1909. The early prospects were unusually bright and inspired the hope that the three billion bushel mark would be reached, but a period of dry and extremely hot weather in August considerably reduced the brilliant prospects in many localities in the northern part of the Mississippi valley, and particularly in Illinois, Missouri, Kansas and Nebraska. Earlier in the season extremely dry weather had done much injury to the crop in Texas, Oklahoma, Arkansas and parts of Missouri, as well as in many localities in the East, especially in the Middle Atlantic States. The fall of the year was favorable to the ripening of the crop and very little injury was done by early frost. Later in the season, however, wet and cold weather in some parts prevented the ears from drying out properly, and the arrival of an early winter interfered with the harvest and caused a large portion of the crop to remain out in the fields. These unfavorable conditions, it is feared, will reduce the value of the corn for seed.

The area devoted to the crop this year ranks first, with an acreage of 108,771,000, or about 7,000,000 acres more than in 1908. The total

production reached 2,772,376,000 bushels, which ranks second only to the great crop of 1906. This crop is greater than the average of the five preceding years by 3.5 per cent. In value, however, the crop of 1909 is a record breaker and presents a most striking fact in the agricultural history of this country. The total farm value reaches the enormous sum of \$1,652,822,000 and is greater by 36 per cent., than the average of the five preceding years, while the farm price per bushel is 32 per cent. greater. The farm price per bushel on November 1, 1909, was 62.2 cents, which has been exceeded in only two years since 1866. The average yield per acre for the year is 25.5 bushels, which has often been exceeded. The largest average yield in any State, 41 bushels per acre, was secured in Connecticut, followed by Indiana with 40 bushels, Ohio with 39.5 bushels, Maine and Massachusetts each with 38 bushels, Vermont with 37 bushels, and New York with 36. The leading corn-producing States, with their acreage, production and value of corn for 1909 are given in the following table:

States	Acreage Acres	Production Bushels	Farm value
			Dec. 1, 1909 Dollars
Illinois	10,300,000	369,770,000	192,280,000
Iowa	9,200,000	289,800,000	142,002,000
Missouri	8,100,000	213,840,000	126,166,000
Indiana	4,913,000	196,520,000	98,260,000
Nebraska	7,825,000	194,060,000	97,030,000
Kansas	7,750,000	154,225,000	83,282,000
Ohio	3,875,000	153,062,000	85,715,000
Texas	8,150,000	122,250,000	92,910,000
Kentucky	3,568,000	103,472,000	64,153,000
Oklahoma	5,950,000	101,150,000	55,632,000
Tennessee	3,575,000	78,650,000	55,055,000
Michigan	1,976,000	69,950,000	42,670,000
South Dakota	2,059,000	65,270,000	32,635,000
Georgia	4,400,000	61,160,000	52,595,000
Minnesota	1,690,000	58,812,000	28,818,000
Louisiana	2,226,000	51,198,000	35,327,000
Wisconsin	1,533,000	50,589,000	30,353,000
Arkansas	2,800,000	50,400,000	36,288,000
Pennsylvania	1,525,000	48,800,000	34,160,000
North Carolina	2,898,000	48,656,000	41,383,000
Virginia	2,040,000	47,328,000	35,023,000
Alaska	3,233,000	43,646,000	27,099,000
Mississippi	2,810,000	40,745,000	33,003,000
South Carolina	2,218,000	37,041,000	33,337,000

All other States had an acreage of less than one million.

By some European statisticians the world's crop for the year is estimated at about four billion bushels, or over 100 million bushels more than the big crop of 1906. These same authorities give the production of various countries as follows: Hungary, 200,000,000 bushels; Argentina, 175,000,000; Mexico, 130,000,000; Italy, 100,000,000; Rumania, 95,000,000; Russia (European and Asiatic), 65,000,000; Egypt, 45,000,000; and Canada about 30,000,000 bushels.

Statistics show that apparently 80 per cent. of the corn crop of this country is used on the farm so that of this year's crop about 2,218,000,000 bushels will be used almost entirely for feeding purposes. Of the remainder about 240,000,000 bushels will be used for flour and grist mill products, 8,500,000 for the manufacture of starch, 9,500,000 for malt liquors, 17,000,000 for distilled liquors, 40,000,000 for glucose and 13,000,000 bushels for seed.

State corn shows are now held in many States, and the third National Corn Exposition was held at Omaha, December 6 to 18. Displays were made by 36 States and also by Canada and Mexico, and 24 States were represented by

exhibits made either by their agricultural college or experiment station or both. Indiana carried away the grand championship for the 10-ear as well as for the single-ear sample. The 10-ear sample was Johnson County White and the single-ear was a cross-bred product. Each grand championship was awarded a \$1000 trophy. This year the corn exposition was planned on broader lines than heretofore and in addition to corn other farm products were shown; and the railroads and manufacturers of farm machinery, food-stuffs, etc., were also represented.

CORNELL UNIVERSITY. An institution of higher learning at Ithaca, New York, founded in 1868. The number of students during the year of 1908-9 was 4859 and the number of instructors and professors 578. The books in the library numbered 369,051. There were received in gifts and endowments during the year \$185,091. The productive funds of the University amount to about \$9,000,000, and the annual income to about \$1,360,000. During the year the Graduate Department of the University, which had formerly been under the direct charge of the general university faculty, was organized into a separate graduate school to be designated as the Graduate School. The faculty of this school is to have exclusive jurisdiction over all graduate work and advanced degrees. There were many changes in the faculty during the year. Mark Vernon Slingerland (q. v.), assistant professor of economic entomology in the College of Agriculture, died during the year. Thomas Frederick Crane, professor of Romance languages and literature and Dean of the University Faculty, retired from active service and was appointed emeritus professor. Professor Adolph Meyer of the Medical College in New York City resigned to take charge of the department of psychopathology at Johns Hopkins University. Martin Wright Sampson was appointed professor of the English language and literature and head of the department. William Wistar Comfort was appointed professor of the Romance languages and literature and head of the department. Graham Lusk was appointed professor of physiology in the Medical College in New York City. Frank Sherman Meara was appointed professor of therapeutics and clinical medicine in the same city. William Bradley Coley was appointed professor of clinical surgery in the Medical College. A large number of promotions to professorships were made among the assistant professors of the University. The president is J. G. Schurman, LL. D.

COSTA RICA. A Central American republic, lying between the Caribbean Sea and the Pacific Ocean, and the republics of Nicaragua and Panama. The area is 18,691 square miles, and on December 31, 1908, the population was officially estimated at 361,779. The principal towns are: San José, the capital, with 26,682 inhabitants; Cartago, 10,000; Port Limon and Heredia, 8000 each; Alajuela, 6000; Puntarenas, 5000. In 1907 immigrants numbered 12,195 and emigrants 8510. Primary instruction is free and nominally compulsory. At the end of 1908 there were 357 primary schools, with 887 teachers and 27,452 pupils enrolled. Lyceums or colleges are established at San José, Cartago, Heredia, and Alajuela. For professional education there are faculties of medicine, pharmacy, dentistry, and law. The state religion is Roman Catholicism.

INDUSTRIES AND COMMERCE. Agriculture is

the principal industry, and almost any crop can be grown, but the chief are bananas and coffee. The production of Costa Rican coffee, which is of most excellent quality, has not greatly developed on account of the competition of cheaper grades from Brazil; but banana culture has increased remarkably, the fruit finding a ready market in New Orleans, Mobile, New York, and Boston, and there is now being made an extensive propaganda, with satisfactory results, to introduce Costa Rican bananas into European ports. Corn, sugar, rice, and potatoes are commonly cultivated. Cacao production and export are increasing notably. Live-stock raising is of considerable importance; according to the latest figures available, cattle number 361,045, horses 59,173, and swine 111,540. Gold and silver are mined. The country contains valuable woods and timber, and in 1909 a concession was granted for the cutting and exporting of cedar and mahogany from a tract of 400 square miles near Guapiles.

In 1908 the imports were valued at \$5,629,405, a decrease of nearly 25 per cent. as compared with 1907, and the exports at \$7,757,525, a loss of over 10 per cent. The leading imports were: Fabrics, \$1,276,409; flour, \$380,412; live-stock, \$239,498 (including 8613 cattle, as against 27,539 in 1907); and machinery, \$181,427. The chief exports in 1908 were: Bananas, \$5,030,004; coffee, \$2,199,545 (8,977,531 kilos, against 17,325,531 in 1907); gold and silver bullion, \$738,858 (an increase of \$153,132); cacao, \$79,518; lumber, \$76,413; and hides and skins, \$62,652. Of the imports 46.5 per cent. came from the United States, 22.8 per cent. from Great Britain, 15.05 per cent. from Germany, and 7.7 per cent. from France. Of the exports the United States received 52.77 per cent. and Great Britain 43.03 per cent.

COMMUNICATIONS. The total length of railways in 1908 was about 400 miles. A line (103 miles) connects San José with Port Limon, and another line (67 miles) is expected to be finished early in 1910 between San José and Puntarenas, on the Pacific. The mileage of lines terminating at Port Limon (including branches and sidings) is 332. In 1907 there entered the ports of Limon and Puntarenas 711 vessels of 1,119,970 tons. Costa Rica has 16 navigable streams, some of which are utilized for steamboat transportation. In 1907 there were 1207 miles of telegraph wire, and in 1908 73 post-offices.

FINANCE. The monetary standard is gold, and the unit of value the colon, worth 46.5 cents. For fiscal years, the revenue and expenditure have been as follows, in colones:

	1906	1907	1908
Revenue.....	6,211,437	7,654,874	7,916,474
Expenditure.....	5,913,584	7,095,503	9,191,449

Estimated revenue and expenditure for the fiscal year 1909 were 7,535,000 colones and 7,359,003 colones respectively. Revenue is derived principally from customs (over half) and liquors. In 1908 the foreign debt amounted to some \$14,350,000 (including interest arrears of \$462,000); the internal debt was 9,752,684 colones. On March 31, 1909, the banks of issue in the Republic held 1,101,198 colones in bank bills and a reserve fund of 510,393 colones. A decree of June 18, 1909, allows banks of issue to issue notes secured by a gold reserve of 40 per

cent. of the total amount of outstanding notes, in place of 50 per cent., as formerly provided.

GOVERNMENT. The executive authority is vested in a president, who is elected for a term of four years, by indirect vote, and is assisted by a cabinet of four members. The legislative power devolves upon a Chamber of Representatives, elected by indirect vote for four-year terms. The President in 1909 was Cleto González Víquez, whose term of office began May 8, 1908. The Republic is divided into five provinces and two comarcas, administered by governors appointed by the President.

Costa Rica has one torpedo-boat and one gunboat.

COST OF FOOD. See Food and NUTRITION.

COTTER, JOSEPH B. An American Roman Catholic bishop, died January 27, 1900. He was born in 1844, in Liverpool. While still a youth he came to America, in 1850, and was educated at St. Paul, Minn., and St. Vincent, Pa. He carried on his theological studies at St. John's University. In 1871 he was ordained priest and from that time until 1889 he was pastor of St. Thomas Church at Winona, Minn. He was consecrated first Bishop of the See of Winona in 1889. He was for three terms president of the Catholic Total Abstinence Union of America, and was a prominent advocate of total abstinence.

COTTON. The Department of Agriculture estimated the crop of 1909-10 at 10,088,000 bales of 500 pounds each, the smallest since that of 1903. The reduction of the crop was due to a number of factors,—the advance of the boll weevil, a wet spring which delayed planting, followed by drought in many regions, disease, etc. While the crop itself is not as large as in some previous years, its value exceeds that of any other ever produced. The Secretary of Agriculture in his annual report estimated the crop and seed as worth \$850,000,000. On November 1, 1909, the selling price on the farm was 13.7 cents per pound, the highest farm price since 1873. On January 10, 1910, the New York price of middling cotton was 15.5 cents per pound. According to the ginning reports issued by the United States Bureau of the Census on January 1, 1910, there had been ginned 9,664,285 bales as compared with 12,465,289 on January 1, 1909, and 9,951,505 for the same date in 1908. This estimate counts the running bales, two round bales counting as one, and excludes lintres.

The estimated crop and amount ginned to January 10, 1910, by States were as follows:

State	Estimated Crop 500 lb. bales	Rep. ginned Jan. 1, 1910 Run. bales
Alabama	1,020,000	1,017,826
Arkansas	715,000	657,732
Florida	57,000	60,136
Georgia	1,800,000	1,812,994
Louisiana	280,000	251,844
Mississippi	1,020,000	1,006,166
North Carolina	615,000	606,296
Oklahoma	617,000	526,602
South Carolina	1,095,000	1,099,718
Tennessee	240,000	226,791
Texas	2,570,000	2,326,650
All others	59,000	54,530
Total	10,088,000	9,646,285

The crop of 1908-9 was 13,553,283 running bales, which included 93,858 bales of Sea Island cotton and 346,126 bales of lintres. The cotton production for the past 10 years reduced to 500

pound bales and including linters was as follows:

COTTON PRODUCTION OF THE UNITED STATES, 1899-1908

Year	Bales	Year	Bales
1908	13,587,306	1903	10,045,615
1907	13,375,461	1902	10,827,168
1906	13,595,498	1901	9,675,771
1905	10,804,556	1900	10,266,527
1904	13,679,964	1899	9,459,935

THE PRODUCTION OF COTTON AND RANK OF THE VARIOUS STATES IN 1908 WERE:

State	Rank	500-lbs. bales
Texas	1	3,913,084
Georgia	2	1,980,077
Mississippi	3	1,704,972
Alabama	4	1,374,140
South Carolina	5	1,195,235
Arkansas	6	1,058,089
Oklahoma	7	706,815
North Carolina	8	663,167
Louisiana	9	486,350
Tennessee	10	359,859
Florida	11	63,221
Missouri	12	61,907
Virginia	13	12,326
All others		7,964

The States included but not named in the above table are Kentucky, New Mexico, Kansas, and Arizona.

The production of Sea Island cotton, while it has been attempted in many parts of the United States away from the coast, is now practically confined to four counties in South Carolina, 26 in Georgia, and 17 in Florida. The crop for 1908 was 93,858 bales, produced as follows: Florida 34,775 bales, Georgia 44,549 bales, and South Carolina 14,534 bales. The Sea Island cotton is not baled as is the case with upland, and the average gross weight of the bales in 1908 was: Florida 382.7 pounds, Georgia 406.7 pounds, and South Carolina 351.8 pounds. The crop of Sea Island cotton for 1909, as far as it was ginned on January 1, 1910, was: Florida 27,482 bales, Georgia 49,886, and South Carolina 12,131 bales, indicating a crop equal to that of 1908 or possibly a somewhat greater one. Efforts have been made to introduce the cultivation of Sea Island cotton into the British West Indies with some success. It is also grown to some extent in Porto Rico and 181,000 pounds, valued at \$52,800, were shipped from there to the United States in 1908. Through the agricultural experiment station in Hawaii the possibility of growing Sea Island cotton of excellent quality has been demonstrated, and it is probable that an attempt will be made in 1910 to produce it on a commercial scale.

The world's production of cotton as shown by the reports of mill consumption in 1908 was about 3,000,000 bales greater than in 1907.

World's production of cotton for mill consumption, 1907 and 1908:

Country	Production (bales, 500 pounds net)	
	1908	1907
United States	13,002,000	10,882,000
British India	2,914,000	2,498,000
Egypt	1,275,000	1,296,000
Russia	846,000	620,000
China	600,000	426,000
Brazil	425,000	370,000
Peru	57,000	55,000
Mexico	140,000	70,000
Turkey	80,000	80,000
Persia	50,000	50,000
Other countries	185,000	165,000
Total	19,574,000	16,512,000

The above figures do not fully represent the world's production of cotton, as in India, China, and other countries of Asia, as well as in South America, much of the cotton does not enter into commercial channels.

According to U. S. Bureau of Census Bulletin 106 the number of spindles operated in the world during the year ended August 31, 1909, was 133,377,000. Of this number, 28,018,305 spindles in the United States consumed 5,240,719 bales of cotton. The active spindles in the United States were distributed as follows: Cotton growing States, 10,429,200; New England States, 15,591,851; and all other States, 1,907,254. The number of active spindles in the United States in 1909 was 512,883 less than in 1908, but the amount of cotton consumed was 701,629 bales greater.

The exports of raw cotton from ports of the United States for the year ending August 31, 1909, were 8,574,024 bales, valued at \$419,733,103, almost exactly a million bales more than for the year previous. Of the exports, the United Kingdom took 3,665,355 bales, Germany 2,438,000 bales, and France 1,098,173 bales. While the United States is the greatest cotton-producing country of the world, furnishing over 67 per cent. of the crop raised in 1908, it received from abroad cotton to the value of \$14,172,241, Egypt and Peru supplying the greater amounts of the direct imports. The cottons of these countries have special properties not found in those produced in this country, and they are imported for special uses. Under the tariff law of 1909 cotton and cotton waste or flocks are admitted free of duty, while all kinds of manufactured goods are subject to ad valorem duties varying from 15 to 60 per cent. In addition to the ad valorem duties on certain classes of goods specific duties are also collected.

The cotton crop of India for 1908 as reported by the Indian government was 2,914,400 bales. The acreage was 19,739,000 acres, a reduction of nearly two million acres from 1907. The average reported yield was only 74 pounds per acre, due in part to the primitive method of cultivation. The estimates of the Indian crop are generally too low, as is shown later by the reports of the exports and mill consumption. In addition to the exports and local mill consumption it is estimated that fully 600,000 bales are annually used in the homes of the people and not considered in the crop returns.

Cotton production in Egypt has been extended until, according to U. S. Bureau of Census Bulletin 100, the crop of 1908 reached 1,275,000 bales of 500 pounds each. According to a German investigator, who made quite a study of the matter in Egypt, the crop of 1908 was 1,420,000 bales. The same author states that the yield is diminishing, due to a number of factors, as soil deterioration, lack of proper fertilizers, unusual meteorological conditions during the past few years, improper use of irrigation water, insect and fungus pests, etc. The yield is said to have fallen from 550 pounds per feddan (1.04 acres) in 1895 to 428 pounds in 1906.

The extension of the cotton area in 1909 did not make very much progress except possibly in Africa. The English, German, and French governments or semi-public associations in those countries are endeavoring to develop cotton cultivation in their colonies. The British Cotton Growing Association was formed to foster the production of cotton in the British colonies. A serious drought in West Africa was responsible

for the first serious setback in the enterprise. The estimated total production of the colonies in 1908, India excepted, was 23,000 bales, a reduction of about 2000 bales from the crop of 1907. The West Indies produced about 7100 bales, practically all Sea Island cotton, in 1908, an increase of 500 bales. The crop of the West African colonies was 6400, a loss of 5200 bales, and about 2500 bales were produced by other British colonies. The most marked increase was in Uganda, where 5000 bales were grown in 1908, an increase of 3000 bales over the production of 1907. Experiments in Ceylon indicate that Egyptian cotton can be grown in that island, yields of over 300 pounds per acre having been obtained. In the Transvaal from 200 to 400 pounds of upland cotton per acre have been secured in experiments fostered by the British Cotton Growing Association. Sir Alfred Jones, prominently identified with this association, died December 13, 1909. In the French possession of Tahiti about 300 bales of Sea Island cotton were produced in 1908. Experiments in Mozambique were a failure with Sea Island and Egyptian cottons, and only a partial success with some varieties of American upland cotton.

COTTON SEED PRODUCTS. The so-called by-products of cotton are each year becoming more extensively utilized. During the year ending June 30, 1909, there were produced in the United States, 5,903,838 tons of cotton seed, of which 3,669,747 tons were manufactured. From this there were obtained products to the value of \$86,092,583 as follows: 146,789,880 gallons of oil, 1,491,752 tons of oil cake and meal, 1,330,283 tons of hulls, and 165,138,628 pounds of lintres. Of the crop of 1908 there were exported cotton seed valued at \$353,213, cottonseed oil valued at \$17,226,451, and cake and meal to the value of \$11,889,415.

THE WORK OF THE U. S. DEPARTMENT OF AGRICULTURE. The proposed standards for grading cotton have been prepared and delivered to the Secretary of Agriculture, with the recommendation that they be not put in use before September 1, 1910. In the meantime efforts are being made to bring these standards to the attention of exchanges and buyers in this country and abroad where American cotton is purchased. Much attention is being given to experiments in breeding cotton for various purposes, such as improved staple, disease resistance, weevil resistance, as well as for varieties adapted to certain localities or conditions where the usual kinds do not do well. The work with Egyptian cotton in Arizona and California brought out some unlooked for variations, indicating a lack of acclimatization, and probably the hybrid origin of the Egyptian cottons. The Mexican boll-weevil investigations have been continued, and this pest has spread over much of Louisiana and the Delta region of Mississippi, where its ravages have been more severe than they were in Texas. This pest is estimated to have destroyed \$20,000,000 worth of cotton in 1909, and as it progresses into regions where the winter and spring conditions are more favorable still greater losses must be expected. Encouraging results have been obtained from the introduction of parasites of the boll weevil, and together with cultural methods, early maturing varieties of cotton, etc., it is hoped in a measure to control this pest. The use of special implements by which the infested squares and bolls are drawn to the open space and ex-

posed to the heat of the sun, has proved a valuable aid in combating the weevil. In the meantime considerable progress is noted throughout the South in the diversification of its agriculture as a result of the demonstration work of the U. S. Department of Agriculture and the State Experiment Stations.

COTTON, CHARLES STANHOPE. A rear-admiral (retired) of the United States Navy, died at Nice, February 19, 1909. He was born at Milwaukee in 1843, and was appointed to the United States Naval Academy in 1858. In 1861 he was ordered into active service. He served throughout the Civil War, rising to the rank of lieutenant-commander. Among the engagements in which he took part was that between the *Merrimac* and the *Monitor* in March, 1862. He served on the *Iroquois*, and the *Ouida*, and with the West Gulf blockading squadron. From 1865 to 1869 he was on duty on the Asiatic station; 1869-70 at the Naval Academy. From 1876 to 1880 he was on duty at the New York Navy Yard, and from 1880 to 1883 commanded the *Monocacy* on the Asiatic station. At the outbreak of the Spanish-American War Captain Cotton was assigned to the command of the cruiser *Harvard*, and in Santiago in July, 1898, he rescued the crews of the Spanish ships *Oquendo* and *Maria Theresa*. In 1903-4 he commanded the European station, and in the latter year retired from active service.

COTTON SEED OIL AND COTTON PRODUCTS. See COTTON.

COUNTRY LIFE COMMISSION. See AGRICULTURE.

COWS. See STOCK RAISING.

CRAIGHILL, WILLIAM PRICE. An American soldier, died January 18, 1909. He was born in Virginia in 1833, and graduated from the United States Military Academy in 1853. He served in the Civil War and in 1865 was brevetted lieutenant-colonel for meritorious services. After the war he was promoted through several grades until, in 1887, he became colonel in the Engineer Corps. He was appointed chief engineer, with the rank of brigadier-general, in 1895. On February 1, 1897, he was retired at his own request, after more than 40 years' service.

CRANE, CHARLES R. See UNITED STATES, paragraphs *Administration* and *Diplomatic Service*.

CRAWFORD, COE ISAAC. An American public official, United States Senator (Republican) from South Dakota. He was born in Volney, Iowa, in 1858, and received his preliminary education from private tutors. He graduated from the Law School of the University of Iowa in 1882 and in the same year was admitted to the practice of law. He practiced in several towns in the State, finally locating in Huron. From 1886 to 1888 he was State Attorney. In 1889 he was a member of the territorial legislative council. He was elected a member of the South Dakota Senate in 1890 and was Attorney-General of the State from 1892 to 1896. He was elected Governor of the State in 1907 and resigned from this office on his election as United States Senator.

CRAWFORD, FRANCIS MARION. An American novelist, died April 9, 1909. He was born at Lucca, Italy, August 2, 1852. His father was Thomas C. Crawford, the sculptor, and his mother was Louisa Ward Crawford, a sister of

Julia Ward Howe. His parents were at the time of his birth at the Baths of Lucca. While he was still very young they returned to their native country and spent some years there. At this time Marion Crawford was sent to St. Paul's school at Concord, N. H., and here he showed remarkable efficiency as a Latin scholar. Following this he went to Trinity College, Cambridge, where he made a study of Oriental and European languages. He did not take his degree, but in 1879 went to India to continue his study of Sanskrit. Here for two years he edited the *Indian Herald* at Allahabad. At the same time he acted as correspondent for several newspapers. Later he went to Italy and from thence to New York City where he was occupied as literary critic for several newspapers and periodicals. His career as a novelist began by accident. In India he had met a man named Jacobs, who, while acting for an English syndicate, had sold the largest diamond in the world to the Nizam of Hyderabad for \$240,000. The British government, on hearing of this, protested against the purchase, and the case was carried into the English courts. Crawford, while in New York, repeated this story to his uncle, Samuel Ward, who liked it greatly and urged him to make a short story of it and publish it. This he did and it appeared as *Mr. Isaac*, which at once attained great popularity. From this time Crawford's life was given up chiefly to the writing of novels. His most notable stories were those written with the city of Rome for a background and included in the Saracinesca series. He wrote also several stories of American life, and a number of historical works, chiefly dealing with Italian subjects. He lived almost entirely in a beautiful villa at Sorrento overlooking the Bay of Naples. Mr. Crawford had an easy and fluent gift of narrative and his books are almost without exception eminently readable. The best known are: *Dr. Claudius* (1883); *Roman Singer* (1884); *A Tale of a Lonely Parish* (1886); *Saracinesca* (1887); *Sant' Ilario* (1889); *A Cigarette Maker's Romance* (1890); *Don Orsino* (1892); *Pietro Ghisleri* (1893); *The Ralstons* (1894); *Via Crucis* (1899); *In the Palace of the King* (1900); *Marietta, a Maid of Venice* (1901). *Arethusa*; *Little City of Hope* (1907); *Prima Donna*; *The Diva's Ruby* (1908). His historical and descriptive work includes *Constantinople*; *Ave Roma Immortalis* (1908); *Rulers of the South* (1900). He wrote also a play, *Francesca di Rimini*, which was produced in 1902 by Sarah Bernhardt. Two posthumous novels from his pen were published in 1909, *The White Sister*, and *Stradella*.

CRAWFORD, OSWALD. An English writer, died January 31, 1909. He was born in 1834, and was educated at Eton, and Merton College, Oxford. After service in the Foreign Office he was appointed, in 1867, Consul at Oporto, where he served until 1891. He wrote books of travel, novels, and poems. Among his works are: *Travels in Portugal*; *Portugal Old and New*; *Sylvia Arden*; *The New Order*; *Revelations of Inspector Morgan*. He wrote many essays and poems under the pen-names "John Dangerfield," "George Windle Sandys," "John Latouche," and "Joseph Strange."

CREMATION OF GARBAGE. See GARBAGE and REFUSE DISPOSAL.

CRETE. A Mediterranean island south of Greece, constituting since 1898 an autonomous

state subject to the suzerainty of Turkey. Area, 3327 square miles; population in 1900 (exclusive of 6113 foreigners), 310,185, of whom 269,848 were Christian and 33,498 Mussulman. In twenty years the Greek element has increased by over 62,000 and the Mussulman decreased by nearly 40,000. The leading towns, with population in 1900, are Canea, the capital, 24,537, and Candia, 22,774. Primary instruction is nominally compulsory. For the year 1907-8 there were reported 621 Christian primary schools, with over 30,000 pupils, and 19 Mohammedan primary schools, with about 2000 pupils; and 29 Christian secondary schools, with over 4000 pupils. There is an annual government grant of about 750,000 drachmas for education (882,000 estimated for the year 1907-8).

The chief industry is agriculture, and the leading product olive oil, which in part is used in the manufacture of soap. The average annual oil production is about 33,000 tons; soap, about 3,155,000 kilos, valued at about 17,800,000 drachmas. Other important products and exports are carob beans, wine, raisins, chestnuts, almonds, hides and skins, and silk cocoons. The largest import is textiles; others of importance are flour, rice, barley, timber, tobacco, sugar, and coffee. In 1906 imports and exports amounted to 19,270,053 drachmas and 17,391,009 drachmas respectively; in 1907, 18,751,520 and 11,966,992 respectively (the drachma is worth 19.3 cents). The olive oil export in 1906 was valued at 8,739,138 drachmas. The trade is chiefly with Greece, Turkey, Austria-Hungary, and Great Britain.

For the year 1907-8 provisional figures for revenue and expenditure were 5,950,220 drachmas and 4,662,096 drachmas respectively. Customs yield about 2,500,000 drachmas annually. In 1907 the public debt was 5,317,226 drachmas; the government has been authorized to borrow 9,300,000 drachmas, mostly for public works.

HISTORY. In 1898, Great Britain, Russia, France, and Italy, as protecting Powers, brought about the autonomy of Crete under a high commissioner, whose appointment, since 1906, lies with the King of the Hellenes. The High Commissioner for the five-year term from October 1, 1906, is Alexander Thr. A. Zaimis, formerly Premier of Greece. The Constitution of 1907 provides for a representative assembly (Bule). Foreign relations are dealt with by representatives of the protecting Powers at Athens. The chief question in 1909 was the status of Crete after the withdrawal of the troops by the four protecting Powers. (See TURKEY, paragraphs on *History*). The strong desire of the Greek element in the population for union with Greece, caused much apprehension. The troops of the four protecting Powers, Great Britain, Italy, France and Russia, were withdrawn from Canea on July 26, but four warships of the Powers were stationed in the neighboring waters. The question of the flag now threatened to cause international difficulties. On August 3, the Cretan Executive Committee issued a decree ordering the Cretan flag to be hoisted on the fortress each day and at certain other places on Sundays and holidays. This caused much ill-feeling in Turkey and the Turkish government was urged by many to adopt vigorous measures. It addressed a menacing note to the Greek government complaining of the acts of certain Greek officers in Macedonia and Crete and demanding the formal renunciation of Crete by Greece. The Powers

protested against the flying of the Cretan flag at Canea and demanded that it be hauled down. This greatly irritated the Cretans and the authorities, in view of the popular feeling, did not obey the command of the Powers. On August 17 the international squadron of the four protecting Powers entered the harbor of Canea. The consuls informed the authorities that the flag would be lowered. The government, which had failed to carry into effect the decision of the Powers as to the flag, resigned, and on August 18 the foreign warships landed 300 men who cut down the flag-staff and left a guard of 60 at the fort. Early in November the Turkish government addressed a note to the Powers asking for an early settlement of the Cretan question in such manner as while granting a full measure of autonomy would make annexation impossible. To this the Powers replied in December to the effect that the time was not ripe for fixing definitely the régime of the island, that they would maintain the *status quo*, and that dangerous complications might follow negotiations on the subject at the present time.

CRETE, EXCAVATIONS IN. See ARCHAEOLOGY.

CRETONI, SERAFIN. A Cardinal of the Roman Catholic Church, died at Rome, February 23, 1909. He was born at Sariano, Italy, 1833, and was created cardinal priest June 22, 1896. In 1895 he was Papal Nuncio to Spain, and assisted in winning the support of the Holy See to the present dynasty, and in bringing over the Spanish clergy from the Carlist cause.

CRICKET. The Gentlemen of Ireland, for the fourth time, visited the United States and Canada in 1909 and played a total of 7 games. They defeated New York, Baltimore and Toronto, lost 2 games to the Gentlemen of Philadelphia and drew 2 games, one with the Colts of Philadelphia and the other with the Ottawas. In the thirty-fifth annual cricket match between teams representing the United States and Canada, the Dominion players won by 143 runs. Canada scored 156-194 and the United States, 85-122. The Kings County Club won the Class A championship in the Metropolitan District League, and the Manhattan Club won the Class B championship. Philadelphia players visited the island of Jamaica during the year and won 6 of the 11 games played.

CRITTENDEN, THEODORE THOMAS. An American public official, Governor of Missouri in 1878, died May 29, 1909. He was born in Selby county, Ky., in 1832, and was educated at Centre College. He went to Missouri before the Civil War and became a law partner of Senator F. M. Cockrell. He was appointed Consul-General to Mexico by President Cleveland.

CRITTENTON, CHARLES N. An American merchant and philanthropist, died November 16, 1909. He was born in Henderson, Jefferson county, N. Y. He began in the drug business in New York City in 1861, and amassed a large fortune. In 1882, after the death of the youngest of his children, a daughter aged five years, he devoted himself largely to evangelistic work. He organized the National Florence Crittenton Mission and continued its president until his death. These homes are for mothers, children, and helpless girls. Mr. Crittenton organized 75 of these missions in the United States and abroad. They are maintained in Marseilles, France; Tokio, Japan; Shanghai, China; and

the City of Mexico. In New York City are maintained the Florence Crittenton Mission and the Florence Crittenton Home for Mothers and Babies. Mr. Crittenton was an active advocate of Prohibition and at one time ran for Mayor of New York City on the Prohibition ticket.

CROSS COUNTRY RUNNING AND MARATHONS. The interest in long distance running, aroused by the Olympic Games in 1907, continued in 1909 and the sport enjoyed another season of great popularity. The Juniors and Seniors National Cross Country Run, held at New York under the auspices of the Amateur Athletic Union, attracted a large field of contestants. The Juniors' championship was won by W. J. Kramer of the Acorn A. A., who ran the 5½ miles in 29 minutes 28½ seconds. J. T. Crowley of the Irish A. A. A., finished second. The prize for the highest team score went to the Irish A. A. A., which made a total of 39 points. In the senior event the same winners finished first and second as in the junior, the winning time for the 6½ miles being 31 minutes 17½ seconds. The seniors' team prize also went to the Irish A. A. A. The Intercollegiate championship was held at Brookline, Mass., and Cornell again was the victorious team. The individual winner was T. S. Berna of Cornell, who ran the 6 miles in 33 minutes 5½ seconds. The team scores were: Cornell, 22; Massachusetts Institute of Technology, 88, and Michigan, 112. The Western Conference Championship was won by Minnesota, with Nebraska second. The individual champion was Wason of Purdue, who covered the 5 miles in 27 minutes, 8 seconds.

A wave of Marathon running swept from one end of the United States to the other in 1909 and hundreds of these classic events were run off. The most important were the Grand International Professional Marathon and the Professional Marathon Derby, both of which were run at the Polo Grounds, New York. Henri St. Yves of Scotland, the winner in both these contests, was a dark horse and surprised the experts by the wonderful showing he made. In the last named event St. Yves made the best time ever made for the distance, covering the 26 miles, 385 yards in 2 hours, 40 minutes and 50½ seconds. Pietro Dorando finished second and J. Hayes third. J. Svanberg of Sweden finished second to St. Yves in the Grand International. Other prominent Marathons of the year and their winners were: February 5, Longboat against Shrubb, won by Longboat; March 15, Hayes against Dorando, won by Dorando; April 18, Svanberg against Simpson, won by Svanberg; May 22, Professional Marathon over London Olympic course, won by Gardner, Labry second; May 29, International at Chicago, won by Svanberg, Hayes second. In distances less than the Marathon, Shrubb, the English runner, showed the most consistent form of any runner, defeating Dorando, St. Yves, twice, and Longboat.

CURLING. The international curling match for the Gordon medal was won by the United States by the score of 59 to 45. The clubs which represented Canada were the Montreal Caledonians and the Lachine Club. The Utica Curling Club, the Thistles and the Boston Curling Club contested for the United States. Other important matches, nearly all of which were held in Van Cortlandt Lake, N. Y., included: Gordon medal match, won by the Terrace City Curling Club; North against South of

Scotland, won by South; Utica Cup Match, won by the Caledonian Club No. 2; Mitchell Medal Match, won by the Utica Curling Club, and the All-Comers match, won by Paris, Ontario. Of considerable interest to the curling world was the invasion of Scotland by a Canadian team. Twenty-seven games were played, of which the Canadians won twenty-four. The good showing made by the invading team in the home of the game surprised the experts.

CRUELTY TO ANIMALS, AMERICAN SOCIETY FOR THE PREVENTION OF. An institution whose object is sufficiently indicated by its name, founded in 1886. In 1909 there were received by the Society 11,229 complaints of alleged cruelty, resulting in 1956 arrests and prosecutions; 7606 animals were suspended from labor; 2570 horses, mules and other large animals were humanely destroyed; 222,468 small animals, homeless or disabled past recovery, were also destroyed, and disabled horses and other large animals were removed in ambulances. The excess of expenses over income was \$14,830. The Society received in bequests \$21,177, and from members' dues, donations and other sources \$12,149. The president is Alfred Wagstaff, and the secretary, Richard Welling.

CRUELTY TO CHILDREN, NEW YORK SOCIETY FOR THE PREVENTION OF. A society founded in New York City in 1874 for the object indicated by its name. It has authority under the laws of New York State, and during 1908 it received 15,957 complaints and prosecuted 9875 offenders, of whom 8126 were convicted. There were rescued from destitution and vicious surroundings 8548 children, and 8605 received care, food, and clothing at the building of the society. The society investigates all complaints of neglect of children and brings action against offenders. A school of instruction for prospective workers is conducted in the building of the society at 297 Fourth Avenue, New York City. The president in 1909 was John D. Lindsay and the secretary and superintendent, E. Fellows Jenkins.

CUBA. An island and republic of the West Indies. The capital is Havana.

AREA AND POPULATION. The area of the six provinces constituting the republic is (according to recent official figures) 44,164 square miles, of which the island of Cuba occupies (approximately) 41,684 square miles, the Isle of Pines, 1180, and other islands and keys, 1350. According to the census of September 30, 1907, the population was 2,048,980, as compared with 1,572,797 in 1899 and 1,631,687 in 1887. The area and population (1899 and 1907) by provinces are stated as follows:

Province	Area sq. m.	Population 1899	Population 1907
Pinar del Rio	5,206	170,354	240,372
Havana	3,170	427,514	538,010
Matanzas	3,256	202,444	239,812
Santa Clara	8,257	356,536	457,431
Camagüey	10,064	88,234	118,269
Oriente	14,211	327,715	455,086
Total	44,164	1,572,797	2,048,980

The principal cities of Cuba, with population according to the 1907 census, are: Havana, 297,159; Santiago, 45,470; Matanzas, 36,009; Cienfuegos, 30,100; Camagüey, 29,616; Cárdenas, 24,280; Sancti-Spiritus, 17,440; Santa Clara, 16,702.

EDUCATION. Under American rule the elementary and secondary school systems of Cuba were reorganized. Primary instruction is nominally compulsory. In December, 1906, there were 2149 schoolhouses, 3649 teachers, and 122,214 scholars. Of the teachers 2363 were women and 1286 men, and 3437 white and 212 colored. According to the census of September 30, 1907, children of school age (5 to 17 years) numbered 541,445, of whom 171,017 (31.6 per cent.) had attended school during the year preceding. Of white children of school age, 31.3 per cent., and of the colored children, 32.3 per cent., attended school. More than nine-tenths of all children attending school were under 15 years of age. For secondary instruction there are many schools and institutes. Higher and professional instruction is provided by the University of Havana. In 1907, of the inhabitants 10 years of age and over, 837,958 or 56.6 per cent., were able to read. Of the total population, 40.9 per cent. were able to read, as compared with 38 per cent. in 1899 and 27.7 per cent. in 1887.

AGRICULTURE. Agriculture is the principal industry, and sugar and tobacco are the staple products, but other crops are cultivated, including coffee, cacao, cereals, potatoes and other vegetables, and fruits. Sugar production is reported as follows: 1906-7, 1,441,910 long tons; 1907-8, 969,178; 1908-9, 1,520,226, the largest output recorded for a single year. For 1908-9, the province of Santa Clara was credited with 509,602 tons, Matanzas 362,080; Oriente 335,753, Havana 183,197, Camagüey 98,024, and Pinar del Río 31,570. The 1908-9 output was ground by 169 mills. Sugar refining is confined practically to Cárdenas, where there are three refineries. From sugar-cane are also produced large quantities of molasses, aguardiente, and alcohol.

The tobacco output in 1907 amounted to 440,745 bales; in 1908, 563,959 bales. Of the latter amount Vuelta Abajo produced 201,095 bales; Remedios, 194,929; Partidos, 64,360; Santiago de Cuba, 12,878; Puerto Príncipe, 5228; and Matanzas, 445. The value of all tobacco produced and manufactured in Cuba in 1908 has been placed at about \$45,000,000.

It is estimated that over 20,000 acres are planted to citron groves, and the 1908 orange

copper, manganese, gold, lead, zinc, asphalt, and salt, but mining has attained only a small development. At present iron mining is the most important of the mineral industries. The brown iron ore deposits, especially those near Nipe and Moa Bay and at Cubitas and Navas were stated in 1909 to promise an addition of 1,000,000,000 tons of ore to the world's supply.

COMMERCE. Imports and exports of merchandise for fiscal years ending June 30 have been valued as follows:

Merchandise	1907	1908	1909
Imports.....	\$ 96,668,889	\$96,993,134	\$83,900,234
Exports.....	110,764,937	97,447,447	115,637,047
Specie			
Imports.....	66,306	1,835,787	2,814,536
Exports.....	4,047,909	14,675,020	1,926,546

The leading imports are food-stuffs (especially cereals and meat), cotton textiles, and iron and steel manufactures.

Tobacco exports for the fiscal year 1909 included 152,908 bales of leaf, against 116,111 bales in 1908; 87,151,904 cigars, against 78,701,912; and 5,802,843 cigarettes, against 7,101,791. The pineapple export aggregated 1,263,466 crates (of 80 pounds) of which 862,844 went to New York, 207,613 to New Orleans, and 114,807 to Mobile. Through Havana there were exported 204,603 crates of tomatoes, eggplants, peppers, etc., 24,348 crates of oranges and grapefruit; 16,257 crates of onions; besides potatoes and other vegetables and fruits.

For the calendar year 1908 the imports and exports of merchandise were valued at \$85,218,391 and \$94,603,324 respectively. The tobacco export was valued at \$31,056,922 (against \$28,645,909 in 1907), including: Leaf tobacco, \$39,771,818 pounds, valued at \$18,354,420 (26,050,783 pounds went to the United States); cigars, 188,846,784, valued at \$12,275,041; cigarettes, 10,202,896 packages, valued at \$295,884; cut leaf, 353,010 pounds, valued at \$131,576. In 1907 the sugar export was valued at \$69,554,419; molasses, \$921,312.

The imports and exports of Cuba by countries for fiscal years ending June 30 have been as follows:

Countries	1907		1908		1909	
	Imports	Exports	Imports	Exports	Imports	Exports
United States.....	\$48,102,673	\$98,141,019	\$46,450,906	\$81,715,884	\$42,593,804	\$90,973,369
Other American countries.....	9,500,062	2,211,504	8,901,268	2,718,005	7,285,280	2,453,336
Great Britain.....	13,039,130	4,446,223	14,350,912	5,145,371	10,639,469	4,930,040
Germany.....	6,435,969	8,150,757	7,762,751	8,741,705	6,350,554	4,484,290
Spain.....	8,286,073	415,305	8,816,910	795,687	7,377,662	1,017,509
France.....	5,781,008	1,002,329	5,854,474	1,768,742	4,793,469	1,296,441
Other European countries.....	3,424,585	821,672	3,624,223	868,179	3,356,100	990,996
All other countries.....	1,398,996	508,135	1,631,778	692,984	1,523,824	471,976
Total.....	96,668,889	110,764,937	96,993,134	97,447,447	83,900,234	115,637,047

crop reached nearly 500,000 crates. The 1908 pineapple crop was estimated at over 1,300,000 crates. In the year 1907-8, cacao production amounted to 6,023,700 pounds, as against 9,380,900 pounds in the preceding year. On June 30, 1909, the reported number of live-stock included 2,936,547 cattle, 523,702 horses, 57,310 asses, and 3202 mules.

MINERALS. Cuba has considerable mineral wealth, especially in Oriente, including iron,

Trade conditions during the year were good. There was a great increase in the exports of sugar to the United States in 1909, but the precise figures were not available.

COMMUNICATIONS. On September 1, 1908, the total length of railways in Cuba was 2329.8 miles. Many of the large sugar plantations are connected by rail with the main lines. Several new railways and important extensions are projected. In March, 1909, contracts were made

for extensions in the province of Oriente amounting to about 175 miles, the government to pay a subsidy of \$9600 per mile. The number of post-offices reported is 418, and of telegraph offices, 147, with 5065 miles of line in operation.

FINANCE. Under the provisional government, the revenue and expenditure from September 29, 1906, to June 30, 1907, were \$28,821,963 and \$25,393,840 respectively; for the year ending June 30, 1908, \$34,020,502 and \$44,551,707. The balance in the treasury on September 29, 1906, was \$13,625,540; on June 30, 1908, \$6,522,518; on March 27, 1909, \$2,515,383. The estimated revenue for the year ending June 30, 1908, was \$29,415,163; the estimated expenditure (including \$9,935,341 extraordinary), \$34,220,644. For the fiscal year 1910, the total revenue and expenditure were estimated at \$33,825,449 and \$33,418,303 respectively. Revenue from customs in the fiscal year 1907 amounted to \$26,311,596; in 1908, \$22,231,707.

ARMY. After the withdrawal of the American forces on January 28, 1909, the maintenance of order in Cuba became the duty of the "Guardia Rural," which during the American occupation had been under the supervision of officers detailed from the U. S. Army and had been brought to a high degree of efficiency. The "Permanent" army as organized in 1909 after the departure of the American forces consisted of a general staff; a brigade of two regiments of infantry of three battalions each; two batteries of light field artillery and four of mountain artillery; a machine gun corps of four companies and a corps of coast artillery. The infantry numbered about 2500 officers and men, the field and mountain artillery about 800, the machine gun corps about 500 and the corps of coast artillery about 1000, which, with the band of staff, made a total of about 5000. These forces were being equipped and trained during the year under the direction of three officers from the U. S. Army assigned to special duty at the request of the Cuban government.

GOVERNMENT. Under the Constitution proclaimed February 21, 1901, the executive authority is vested in a president, who is elected indirectly for a term of four years and is assisted by a cabinet of eight ministers appointed by himself and responsible to Congress. The legislative power devolves upon a Congress of two houses, the Senate (24 members, elected indirectly for eight years) and the House of Representatives (64 members, elected by direct vote for four years). The first President of the Republic, Tomás Estrada Palma, resigned his office September 28, 1906, and the United States intervened until new elections could be held. To determine the number of legal voters, the census of September 30, 1907 was taken. In December, 1908, Gen. José Miguel Gómez was elected President, and Alfredo Zayas Vice-President. They were inaugurated on January 28, 1909, when the American Provisional Governor, Charles E. Magoon, withdrew. Each of the six provinces is administered by a governor, elected by popular vote for four years.

HISTORY. In 1908 President Roosevelt had announced that before February 1, 1909, the second American intervention would terminate and the government of the island be turned over to its own officers. On January 1, 1909, the American troops began to withdraw. As a result of the elections of 1908, General José Miguel Gomez was elected President and Dr.

Alfredo Zayas Vice-President. The Cuban Congress assembled on January 23, after an interval of a little over two years, and, having effected a permanent organization and canvassed the election returns, officially proclaimed the President and Vice-President. On January 28, the American Provisional Governor Magoon turned over the administration to the new executive. This marked the end of the second American intervention, which began on September 29, 1906, when Mr. Taft, then Secretary of War, went to Cuba on the occasion of the revolution against President Palma. Mr. Charles E. Magoon succeeded Mr. Taft in carrying out the work, being appointed Provisional Governor on October 13, 1906. The most important of the early appointments by the new President was that of General Pino Guerra as commander-in-chief of the permanent army. He proceeded to put into effect a plan for military reorganization. A disturbance occurred in the rural guard in the province of Santa Clara, but by the middle of March it had subsided. Congress passed an amnesty measure applying to all persons except those convicted of "unnatural crimes"; a law authorizing the President to suspend at his discretion the duties on the exports of sugar, tobacco and liquors, which had been imposed by President Palma for the purpose of raising the interest on the loan of \$35,000,000 for the payment of the troops; laws authorizing cock fights and establishing a national lottery, and a law authorizing the introduction of long distance telephones. A measure, much discussed in the newspapers, prohibiting further purchase of Cuban land by aliens, was defeated. Congress adjourned before agreement on the budget was reached and President Gomez was obliged to provide for the situation by a decree declaring the budget of last year in effect. The earliest measure passed by the Cuban Congress was declared unconstitutional by the Supreme Court. The cost of the second American intervention was estimated at \$0,000,000.

The chief criticism brought against the first year of the independent Cuban administration was that of extravagance, and the carrying of too many officials on its pay-rolls, and President Gomez was blamed for not taking a firmer stand against the place hunters. The finances, however, were brought into better condition, although the year began with practically an empty treasury and heavy obligations and contracts. On presenting the budget on November 15, President Gomez announced that there was a surplus of \$4,000,000 in the treasury.

CUMBERLAND PRESBYTERIAN CHURCH. A religious denomination, organized in 1810. In 1903 a movement was begun to merge the Cumberland Presbyterian with the Presbyterian Church in the United States of America. This effort culminated in 1906, in a vote of the majority in the Cumberland Assembly to adjourn *sine die* as a separate Assembly. A large majority of those commissioners who opposed the proposed union, emphasized their protest by continuing, as they claimed, the work of the Cumberland Assembly, thus ignoring the majority vote. It is claimed by those who voted for the union that the church had been merged with the Presbyterian Church of the United States of America, and that the Cumberland Presbyterian Church, as it was composed, prior to 1906, does not exist.

That body which refused to accept the union, on the other hand, claimed that the Cumberland Presbyterian Church was not a new organization, but was a continuation of the same church, organized in 1810, notwithstanding the exit of nearly one-third of its membership and two-thirds of its preachers who joined the Presbyterian Church of the United States of America.

Litigation was carried on in 1908-9 to determine the disposition of the property involved. During 1909 Supreme Court decisions favorable to the unionists in Kentucky and Texas were made, both of which courts held in effect that a civil court could not review the acts of an ecclesiastical court. Supreme Court decisions favorable to the Cumberlands in Tennessee and Missouri were made. Both of these went into the merits of the case, and declared the union null and void on account of doctrinal differences between the two churches; also on account of the want of expressed constitutional authority to form such union. The Appellate Court of Indiana gave a sweeping decision in favor of the Cumberland Presbyterians and declined application for a re-hearing. The Cumberland Presbyterians also gained two suits in two United States District Courts in Tennessee as against no decisions gained in any United States District Court by the unionists. Supreme Court decisions are pending in California, Illinois and Mississippi. The 79th General Assembly of the Church convened at Bentonville, Arkansas, from May 20 to 26, 1909, with an increased representation. The 80th General Assembly will convene near the birthplace of the Church at Dickson, Tennessee, in May, 1910. About 100,000 communicants and 600 preachers remained in adherence to the Cumberland Presbyterian Church.

CUMMINS, ALBERT BAIRD. An American public official, United States Senator (Republican) from Iowa. He was born at Carmichaels, Pa., in 1850. He was educated at Waynesburg College and Cornell College, Ia. He studied

for by the bill passed by the Senate. He has long been a strong political power in Iowa and was the leader of the radical element which opposed the more conservative branch of the Republican party of the State headed by Senator Allison.

CURACAO. A Dutch West Indian colony, comprising the islands of Curaçao, Buen Ayre, St. Eustache, Saba, and the southern part of St. Martin (the northern part belonging to France). Total area, 436 square miles, about half of which is comprised in the island of Curaçao; population at the end of 1906, 52,758, of whom 30,401 were residents in Curaçao. Willemstad, the capital, has about 14,000 inhabitants. In 1907 Roman Catholics numbered 45,452, and Protestants 6672. The leading products are corn, beans, sugar, tobacco, and phosphate of lime. In 1906 the imports and exports of the island of Curaçao were 3,152,584 florins and 493,000 florins, respectively (1 florin equals 40.2 cents); exports of the entire colony amounted to 1,034,016 florins. The revenue for 1909 was estimated at 640,970 florins, and the expenditure 935,152 florins, the deficit being supplied by the Netherlands.

CURRENCY. The problem of currency reform received continuous discussion through the year, but very little that was new was developed. The Aldrich-Vreeland act of 1908, providing for an emergency currency, was severely criticised on the ground that its benefits could be utilized only after a severe money stringency had set in, and not as a preventive to such stringency. While prominent bankers were not less inclined than previously to emphasize the necessity of introducing elasticity into the currency system, there was a tendency to make this a part of the larger problem of organizing the nation's banking credits. See CENTRAL BANK.

An inquiry made for the National Monetary Commission showed the money held by national banks and all other reporting banks on April 28 to be as follows:

Classification	National banks (6,893)	All other banks (15,598)	Total all banks (22,491)
Gold coin	\$151,366,529.52	\$ 75,499,867.50	\$226,866,397.03
Gold certificates	375,668,480.00	207,039,340.00	582,707,820.00
Silver dollars	11,869,927.00	10,697,159.00	22,567,086.00
Silver certificates	124,348,526.00	55,250,744.00	179,609,270.00
Subsidiary and minor coins	19,212,159.29	13,699,181.22	32,911,340.51
Legal-tender notes	198,898,210.00	72,895,792.00	271,794,002.00
National bank notes	45,413,071.00	68,125,023.00	113,538,094.00
Cash (not classified).....		22,020,666.80	22,020,666.80
	\$926,776,902.82	\$525,237,773.52	\$1,462,014,676.34

surveying and became chief engineer of the Cincinnati, Richmond and Fort Wayne Railroad. After carrying on the study of the law he was, in 1874, admitted to the bar. He practiced law in Chicago from 1874 to 1878, and in the latter year removed to Des Moines, Ia. In 1878 he was a member of the Iowa Legislature, and was an unsuccessful candidate for the United States Senate in 1894 against Senator Allison. He was a member of the Republican National Committee from 1896 to 1900, and was elected Governor of Iowa in 1902-4, 1904-6 and 1906-8. Senator Cummins was one of the most aggressive of the "insurgent Senators" who advocated a lower tariff revision than that provided

This cash was distributed by geographical divisions as follows: New England, 6.11 per cent.; Eastern States, 49.59 per cent.; Southern States, 7.33 per cent.; Middle Western States, 25.85 per cent.; Western States, 4.92 per cent.; and Pacific States, 6.2 per cent. Of the aggregate cash New York banks held 39 per cent.; Illinois banks, 10 per cent.; and Pennsylvania banks, 8 per cent. California banks held \$33,859,000 in gold coin, as compared with \$19,800,000 in gold coin held by Pennsylvania banks, \$17,489,000 by Illinois banks and \$16,368,000 by New York banks. More than 60 per cent. of the gold certificates were held by New York banks, as were also 37

per cent. of the silver certificates. Texas banks held the greatest amount of silver dollars, \$1,938,000; but New York banks held one-third of all the legal-tender notes.

The ratio of total cash to total deposits was 10.34 per cent., being 19.2 per cent. for national banks, 9.2 per cent. for State banks, 8.97 per cent. for loan and trust companies, 5.74 per cent. for private banks, and .88 per cent. for savings banks. See NATIONAL BANKS and CENTRAL BANK.

CURRIE, SIR DONALD. An English ship-owner, died April 13, 1909. He was born in Greenock, Scotland in 1825. He was in the service of the Cunard Line until 1862, when he founded the Castle Line between Liverpool, London and the East Indies. In 1873 he established a steamship line to South Africa, which in 1900 was amalgamated with the Union Line, forming the Union-Castle Mail Steamship Co. He was knighted in 1881 for services in transporting troops to South Africa during the Zulu war. Sir Donald sat in Parliament from 1880 to 1900. He was considered one of the greatest authorities on South African affairs.

CUSHMAN, FRANCIS W. A Representative (Republican) to Congress from Washington, died July 6, 1909. He was born at Brighton, Iowa, in 1867, and was educated chiefly in the public schools. On the completion of his school course he worked as a "section hand" on a railroad. At the age of sixteen he removed to Wyoming, where he remained for five years, working on a cattle ranch, in lumber camps, teaching school and studying law. He removed to Nebraska, and, having been admitted to the bar, practiced law in that State. In 1891 he removed to Washington, and engaged in the practice of law in Tacoma. He was elected to Congress for six successive terms, beginning with the Fifty-sixth Congress. Mr. Cushman was one of the ablest debaters in the House, and was noted for his brilliant wit, and his quickness at repartee. He was a member of the Ways and Means Committee.

CUST, ROBERT NEEDHAM. An English colonial official, died October 28, 1909. He was born in 1821 at Cocayne Hatley in Bedfordshire, and was educated first at a private school and afterwards at Eton. The offer of an appointment in the Indian Civil Service, led to his going subsequently to an East Indian college at Haileybury. In 1842 he went to India and in 1844 was appointed assistant to the Governor-General's Agent on the Northwestern frontier. He took an active part in several of the campaigns against the Sikhs and in 1845 he was appointed district officer of one of the newly annexed provinces. In 1852 he was appointed joint magistrate at Benares, and subsequently became magistrate and collector of Banda. After having been admitted to the bar and having served in several important positions, he became, in 1860, financial commissioner of the Punjab and in 1862 he became judicial commissioner of the Punjab. He accepted a seat in the Legislative Council and was appointed to act for three months as Home Secretary of the Government of India. In 1866, after returning to England, he accepted the post of a member of the Board of Revenue in the Northwestern provinces and returned again to India. He drew up a code of

revenue law for India which was published in 1870. He served as vice-president and honorary secretary of the Royal Asiatic Society and as a member of many other societies. He did important work in behalf of Christian missions and in connection with the dissemination of the Bible in foreign tongues.

CUSTOMS COURT. See TARIFF, and UNITED STATES, paragraph Tariff.

CUSTOMS FRAUDS. See UNITED STATES, and TRUSTS.

CUYLER, THEODORE LEDYARD. An American Presbyterian clergyman, died February 26, 1909. He was born in Aurora, N. Y., in 1822, and graduated from Princeton University in 1841, and from the Princeton Theological Seminary in 1846. He was ordained in 1848, and after several pastorates was called, in 1860, to the Lafayette Avenue Presbyterian Church in Brooklyn. There he remained until 1890, when he resigned to enter upon a ministry at large. Dr. Cuyler was throughout his life prominent in public life. He assisted actively in organizing the Republican party in 1856, and took a foremost part in many political and social reforms. He was of that notable group of Brooklyn clergymen which included Henry Ward Beecher and Dr. R. S. Storrs. Dr. Cuyler was a voluminous writer on many subjects. His autobiography entitled, *Recollections of a Long Life—An Autobiography*, was published in 1902 and forms a very interesting and valuable record. He wrote 4000 articles for religious papers, many of them translated into foreign languages.

CYPRUS. A Levantine island, nominally a part of the Ottoman Empire, but occupied by Great Britain under the Convention of June 4, 1878. Capital, Nicosia, with 14,752 inhabitants. Area, 3584 square miles. Population in 1901, 237,022; estimated population in 1907, 256,433, of whom 182,739 were Greek Christians, and 51,309 Mohammedans. The elementary schools in 1907-8 numbered 545 (182 Moslem and 363 Christian), with 27,529 pupils (5298 and 22,231). There are five high schools and a gymnasium. The soil is proverbially fertile, and the chief occupation of the people is agriculture. The yield of the chief crops in 1907 was as follows: Barley, 2,906,755 bushels; wheat, 2,600,839; oats, 334,374; vetches, 156,156. Cotton, olives, grapes, carobs, fruit, linseed, silk, wood, hides, and origanum oil are also produced. In 1898 there were 62,174 horses, mules, and asses, and 47,242 cattle; and in 1907 258,960 sheep and 239,450 goats. Irrigation works were completed in 1901. The sponge fisheries are remunerative. Copper and asbestos are mined; gypsum, terra umbra, and marble are found in quantity. The total imports and exports, inclusive of specie, in 1908 amounted to £618,781 and £653,589 respectively, against £702,893 and £635,055 in 1907. Imports from Great Britain (1908), £158,325; exports, £154,861. The wine export in 1908 was 887,545 gallons (nearly all to Egypt), and that of spirits 49,230 gallons (to Turkey). A narrow-gauge railway connecting Famagusta with the capital (36 miles), opened in 1905, has been extended to Morphou, a total of 60 miles. The harbor at Famagusta has been rendered accessible to steamers. There is regu-

lar steamship service from Egypt. There are 746 miles of highways, and 240 miles of telegraph lines. A cable connects with Alexandria. The shipping entered and cleared in 1907 aggregated 644,320 tons. The revenue and expenditure for three successive years was as follows: 1906-7, £286,873 and £182,068; 1907-8, £311,810 and £203,029; 1908-9, £303,477 and £244,061. Public debt, £309,000, for harbor, railways, and irrigation. The sum of £92,800 and 4,166,220 okes of salt are payable annually to the Sublime Porte under the Convention of 1878. The annual grant from Imperial funds to the revenue was (1907-8) £50,000. The Imperial Ottoman Bank has a branch in Cyprus. The government is administered, under the Colonial Office, by a high commissioner, assisted by a legislative council. The High Commissioner in 1909 was Sir Charles Anthony King-Harman.

Owing to the election of the new archbishop by civil instead of canon law some fighting was reported in March at Limasol on the occasion of his installation.

CYCLING. The professional sprint championship in 1909 was again won by F. L. Kramer, who scored a total of 42 points. A. J. Clarke was second with 36 points and J. A. Fogler, third, with 19 points. The contest for first honors between Kramer and Clarke was the feature of the cycling season. E. L. Collins won the professional paced championship, scoring a total of 79 points; J. F. Moran was second with 40 points. The amateur championship went to P. O. Lawrence, who made a total of 17 points; J. Magin finished second only 5 points behind Lawrence. The 100-kilometre world's professional paced championship match, held at Copenhagen, Denmark, was won by Georges Parent in 1 hour, 35 minutes and 45 $\frac{1}{2}$ seconds. Francois Cuzin at Munich established a new amateur record for one hour (motor paced), going 56 miles, 1128 yards. The same rider also covered the 100' kilometres in 1 hour, 5 minutes and 45 $\frac{1}{2}$ seconds. R. Duer at Los Angeles, Cal., made new paced records, against time, for all distances between 1 and 10 miles inclusive, his time being: 1 mile, 1 minute 5 seconds; 2 miles, 2 minutes 9 $\frac{1}{2}$ seconds; 3 miles, 3 minutes 14 $\frac{1}{2}$ seconds; 4 miles, 4 minutes 18 $\frac{1}{2}$ seconds; 5 miles, 5 minutes 23 $\frac{1}{2}$ seconds; 6 miles, 6 minutes 28 $\frac{1}{2}$ seconds; 7 miles, 7 minutes 33 $\frac{1}{2}$ seconds; 8 miles, 8 minutes 38 $\frac{1}{2}$ seconds; 9 miles, 9 minutes 45 $\frac{1}{2}$ seconds; and 10 miles, 11 minutes 6 $\frac{1}{2}$ seconds. In the half-mile the new record of 39 seconds was made by W. Samuelson. New unpaced records, against time, were made by E. A. Pye, who rode 2 miles in 4 minutes 3 $\frac{1}{2}$ seconds; by W. Samuelson, who covered 3 miles in 6 minutes 18 seconds, and by S. Williams, who rode 4 miles in 8 minutes 34 $\frac{1}{2}$ seconds and 5 miles in 10 minutes 38 seconds. In professional competition new records were made in the 2-mile (3.40 $\frac{1}{2}$) and 5-mile (9.42 $\frac{1}{2}$), by I. Lawson; the 15-mile (33.16), by P. Drobach; the 20-mile (44.45 $\frac{1}{2}$), by F. Hill; and the 25-mile (56.21), by A. J. Clarke. In amateur competition the only new record made was in the 5-mile, by E. Mayer, who rode the distance in 10 minutes 11 $\frac{1}{2}$ seconds. The annual six-day race held in Madison Square Garden, New York, December 6-11, judging from the attendance and enthusiasm, is gaining in popularity. The event for the first time was won by a team composed of riders who had lost their original partners through accident, and

who accordingly had been penalized one lap. Rutt and Clarke won from Root and Fogler by one lap. The distance covered by the leaders, 2660 miles 1 lap, was 77 miles behind the record made by McFarland and Moran in 1908.

DAHOMEY. A French colony in French West Africa (q. v.). Area, 37,527 square miles. Population (1906), 748,999. The natives are of pure Negro stock, and belong to the Fon branch of the Ewe family. In 1906 there were 8 government and 15 mission schools, with a total of 2600 pupils. The natives are industrious agriculturists and grow corn, manioc, yams, and potatoes. The forests contain baobab trees and cocoanut and oil palms. Total imports (1907), 11,655,312 francs; exports, 9,670,983 francs. Total railway lines open (1908), 192 miles; under construction, 125 miles. There are few roads. There are 1725 miles of telegraph and 120 miles of telephone lines, and 25 post-offices. In 1907, 390 vessels of 504,960 tons entered, and 391 of 506,724 tons cleared at the ports. The local budget (1904) balanced at 5,549,550 francs. The Lieutenant-Governor (H. Malan, in 1909), is under the direction of the Governor-General of French West Africa.

DAIRYING. The dairy industry of 1909 differed in no essential particular from the previous year. In the United States the price of milk, butter, and cheese has remained about the same, being uniformly higher during the past two years. The drought in some of the Eastern States and the high price of feeding stuffs have materially increased the cost of production. The increased cost of feeds of the past few years has led to the more extensive growing of crops to take their place.

The National Dairy Show, held at Milwaukee, Wis., in the fall, exceeded all previous exhibitions in size and in educational value. The dairy stock included representatives of all the principal dairy breeds, besides a special class for grades. The student dairy stock judging contest was participated in by teams from seven colleges. A number of meetings of dairy associations were held in connection with the show. The dairy exhibit at the Alaska-Yukon-Pacific Exposition in Seattle was of considerable importance. Special features connected with it were a model creamery in operation and a model dairy barn.

The State and National dairy shows and the recently-formed Cow Testing Associations have helped to improve dairy stock. National and local dairy officials have been encouraging dairymen to keep records of individual cows in order to detect and eliminate the unprofitable individuals. The Indiana Experiment Station in coöperation with the Erie Railroad ran a milk production special over the Erie lines in Indiana to furnish information to dairymen. The train was equipped by the railroad and the Experiment Station furnished lecturers and distributed printed matter. This educational work aids materially to increase the total production of milk even without a large increase in the number of cows.

During the past twenty-five years there has been a wonderful development in the condensed milk industry, which began in the United States in 1856. In 1880 13,000,000 lbs. were made, in 1890 33,000,000, in 1900 187,000,000, in 1909 nearly 500,000,000 lbs. The exports amount to about 25,000,000, the imports to 7,000,000 lbs. annually. In many places where condensed milk

factories have been erected increased prices of milk result and business is taken away from cheese factories and creameries. The consumption of condensed milk is constantly increasing in Brazil, India, Siam and other tropical countries. In Japan the imports increased from 173,467 dozen cans in 1899 to about 1,000,000 cans in 1909, one-half of which came from the United States. In Mexico and the South American countries there are good fields to increase the trade.

The dairy industry in Canada is steadily growing, although the exports of dairy products are on the decrease, owing to a larger home consumption. The exports of butter have fallen from 34,128,944 lbs. in 1903 to 6,326,355 lbs. Exports of cheese, bacon and ham have declined. The former rate of duty in the United States on separator cream was 20 per cent. ad valorem, while under the new tariff law the rate is reduced to 5 cents per gallon. This change has resulted in an extensive importation of cream instead of butter from Canada. The duty on butter is 6 cents per pound, but by importing the cream the duty is reduced to about 2 cents a pound. Canadian creameries along the frontier find it advantageous to export their entire product of cream to be manufactured into butter at creameries across the United States border. In Alberta the dairy industry is progressing rapidly, especially the manufacture of butter, which has increased 70 per cent. in the past two years. Much of this increase has been made during the winter months. The entire output, which reached 2,550,000 pounds the past year, is disposed of in British Columbia and the Yukon district.

A notable event in European dairying was the fourth International Dairy Congress, held at Budapest, in June. The Congress was opened by the patron Archduke Joseph, with over 1000 delegates in attendance. Many interesting and valuable papers were presented on the different lines of work connected with dairy husbandry, milk hygiene and the inspection of milk. The programme also included many excursions to typical dairy farms and milk depots in the vicinity. The next congress will be held in Stockholm in 1911.

In nearly all European countries the amount and value of dairy products are increasing, although hardly keeping up to the increase in population. Denmark continues to be the most progressive dairy country, largely because of the co-operative dairies which were first organized in 1882 and now number 1100 with 160,000 members. The milk from nine-tenths of the cows in that country is sent to these co-operative dairies, which return better prices to the dairyman than he was able to obtain before they were formed. Germany is a large importer of dairy products in spite of the increase in home production of milk. The dairy industry is growing in South Africa and Australia, but there are few signs of progress in South American countries.

The most significant feature in dairying in nearly all countries is the campaign for clean milk, which is a part of the general movement for pure food of all kinds. Unsanitary milk is a great menace to human welfare; the danger of contracting disease is much greater than from meat, because milk, cream, and butter are commonly consumed in the raw state. In the past the sanitary conditions under which milk and its products have been produced were often bad. Improvement has been brought about by

the activity of government officials, physicians, and the formation of Medical Milk Commissions in many of the large cities. These agencies encourage the dairy farmer to improve the quality of his milk by offering to those who desire it information on improving equipment and methods. Tests and bacterial counts of milk are made and all milk coming within the requirements means eventually higher prices to the dairyman who is willing to produce a clean and wholesome product.

The drastic milk ordinance of Chicago, requiring that all milk not from tuberculin-tested cows must be pasteurized, has been in effect one year and has resulted in improving the quality of the milk, although there has been some fraud in connection with the tuberculin testing. Veterinarians have made false reports, and farmers have immunized their cows preparatory to the test. It has been found easier to control the pasteurizing than the tuberculin testing. Studies of pasteurizing plants in Chicago and in Boston show that it is not always properly done and should be under strict supervision. At best, pasteurization is a necessary evil and often means cooked dirt and cooked bacteria. Samples of commercially pasteurized milk showed that bacteria multiplied four times as fast in the pasteurized milk as in the unpasteurized. The ideal to be aimed at in milk production is better sanitary conditions in the cow stable and more care in handling the milk. A new regulation of the Boston Board of Health forbids the selling of bulk milk in retail stores, in order to prevent contamination of milk after it leaves the farm. In some places instances of watering milk have been found under the guise of ice placed in the can to cool the milk.

Dr. A. F. Hess has studied the health of children of New York City known to have used milk that contained virulent tuberculous germs of the bovine type. Though they seemed to be in average health, one-fourth of them reacted to a conjunctival tuberculin test, from which it is argued that the bovine type of tubercle bacilla, although less virulent, are capable of infecting human beings, and that all milk coming from suspected cows should be pasteurized under competent supervision. The health department of the city of Birmingham, England, have begun the fight against the spread of tuberculosis by supplying dairy farmers within ten miles of the city with free tuberculin and veterinary assistance for testing their cows. During the first five months of the existence of the Lady Talbot Milk Institute at Melbourne, Australia, which was established to reduce the death rate of infants by supplying sanitary milk, only 8 out of 300 infants supplied died, a remarkable showing, as the majority when first put on the milk were already suffering from troubles caused by impure milk.

A number of new patents have been granted for methods of making dried milk, a product that may become commercially of importance in a few years. Methods have been devised for sterilizing milk by means of electricity and by ultra-violet rays, without subjecting the milk to high temperatures. Paper milk bottles have been used for several years and their practicability established so that their use is on the increase. The New York Milk Committee recently decided to use them at their infant milk depots.

Many investigations have been carried on at

the State experiment stations connected with the manufacture of butter and cheese, the bacteriology and chemical composition of milk, and the economics of dairying. Experiments conducted by the National Department of Agriculture have shown that acid in cream causes great changes in the flavor of butter, and that the troublesome "fishy flavor" occurs only in highly acid butter and sometimes only when it has been overworked. A special study of the manufacture of Camembert cheese in the United States has shown that the unfavorable climatic conditions in many places where factories have been located can be overcome by constructing factories in such a manner as to control humidity, temperature, and ventilation.

Among the important books on dairying published during the year are: A. Sommerfeld, Wiesbaden, *Handbuch der Milchkunde*; L. L. Van Slyke and C. A. Pablow, New York, *The Science and Practice of Cheesemaking*; B. Martiny, Leipzig, *Geschichte der Rahmgewinnung*.

DAMS. The great Gatun Dam for the Panama Canal, the construction of which was begun in 1908, continued in 1909 to be a subject of much discussion by engineers. By a few the design of the great structure was criticized, but the consensus of opinion expressed by the majority of engineers who had examined the question and given careful consideration to this kind of engineering was that the project was most feasible and its execution would be attended by success. Work on the Gatun Dam progressed during the year (see PANAMA CANAL), and at its close rapid progress was being made. Other important dam construction in the United States was in connection with the new Catskill Water Supply for New York City, as great reservoirs were required at Ashokan on Esopus Creek and at Kensico and Hill View on the eastern side of the Hudson. The Ashokan Reservoir, which is to contain some 128,000 million gallons of water, is formed by dams aggregating 5.1 miles in length, and of these the largest is the Olive Bridge Dam, which is 4850 feet in length on top and contains a central masonry quartz section 1000 feet in length, with a maximum height above the lowest foundation excavation in the rock of 240 feet. It will have a minimum thickness at the top of 23 feet and its top 20 feet above the full level of the reservoir. It is of cyclopean masonry, and faced on both sides with cast concrete blocks. The Kensico Dam is also a massive structure of somewhat similar character. In the West, the completion of the Laguna Dam on the Colorado River, a part of the Yuma Irrigation Project and the high Pathfinder Dam on the North Platte River in Wyoming, were notable achievements of the U. S. Reclamation Service. The former was a concrete structure, while the latter was of rubble cyclopean masonry, 218 feet in height and 500 feet in length on the top. During the year the great Roosevelt Dam near Phoenix, Ariz., was brought nearly to completion. It is a masonry structure 1080 feet in length by 284 feet in height. Two important earth dams were under construction in the United States during the year, one the Arrowhead Dam, forming the Arrowhead Reservoir in California, being the highest earth dam ever designed. It is 200 feet in height from the ground, or 220 feet from the bottom of the concrete core wall, and has a width on top of 20 feet, the slope being 2½ to

1 on the water side and 2 to 1 on the earth side. It was being constructed by discharging the material from side-tipping cars and then using powerful hydraulic jets to wash it into place. It was originally proposed to construct the dam by hydraulic filling, sluicing the material into place, but this was abandoned for the method described. The Standley Lake Dam, near Denver, Colo., was the second notable earth dam of the year. It is 140 feet high and 20 feet wide on top, the slopes being 2 to 1. The construction consisted in depositing material from temporary timber trestles and forming a series of embankments of increasing height toward the centre of the dam. By admitting water in the spaces between successive embankments the material was thoroughly consolidated and the discharges from the construction cars run out on the trestles were thoroughly spread over the banks.

A dam which it was said would form the largest water storage reservoir in Europe was in course of construction during the year between Soesb and Arnsberg, western Prussia, in the valleys of the Helve and Mühne. It is 131 feet in height from the ground level and 2083 feet in length, backing up water over an area of 2510 acres, or nearly four square miles, and forming a reservoir with a capacity of over 30,800 million gallons. The cost of construction in addition to the land was estimated at about \$5,000,000, and the work required the temporary diversion of the two rivers. The water not only will form a storage supply, but advantage will be taken of the head to maintain a hydroelectric station, which should develop about 2000 horse-power.

The Esneh Barrage, constructed by the Egyptian government across the Nile 100 miles north of the great Assuan, was opened during the year. It is 2868 feet long and consists of 11 large or abutment piers 37 feet 8½ inches in height and 13 feet thick, and 108 smaller piers 6½ feet thick, there being 120 openings each 16 feet 5 inches wide. These piers are connected by concrete arches and above is carried a roadway. There is a lock and drawbridge and the passage of water can be controlled by sluices. The object of the barrage is to hold the water of low floods and a maximum head of about 33½ feet is sustained. The foundations are enclosed by two lines of cast-iron sheet piling 60 feet 9 inches apart, driven parallel across the river. There is a heavy floor of concrete and stone masonry in the bed of the river and above is riprap protection to prevent scour. The sluices are controlled by two gates each operated by traveling winches.

DANDRIDGE, ELIZABETH (TAYLOR). The daughter of Zachary Taylor, and mistress of the White House during his term as President, died July 26, 1909. She was born near Louisville, Ky., in 1824. She married Col. Wallace Bliss during the Mexican War. He died of yellow fever in New Orleans, and she married, some time later, Philip Pendleton Dandridge. He died in 1881. Mrs. Dandridge was a sister of the first wife of Jefferson Davis.

DANIELL, MOSES GRANT. An American educator and author, died October 18, 1909. He was born in Boston in 1836, and graduated from Harvard College in 1863. He was for three years master of the Everett School, Dorchester, Mass., and for seventeen years master of the

Roxbury High School, Mass. For twelve years he was principal of the Chauncey Hall School, Boston. He gave up active educational work and became connected with the editorial department of Ginn and Co., educational publishers, Boston. He was the author of many Latin and Greek text-books. Among them are, *New Latin Composition* (1889); *Exercises in Greek Composition* (1893); *First Latin Book* (1894); *The New Caesar* (1898) and *Second Year Latin* (1899). He was prominently identified also with several musical societies. He was for twenty years president of the Boston Handel and Haydn Society.

DANISH ANTILLES, DANISH COLONIES. See DENMARK.

DANISH WEST INDIES. A colony of Denmark, consisting of three islands of the Virgin group in the West Indies lying east of Porto Rico. St. Croix has an area of 84 square miles and a population (1901) of 18,590; St. Thomas, 33 square miles and 11,012 inhabitants; St. John, 21 square miles and 925 inhabitants. The inhabitants are mostly free negroes engaged in the cultivation of the sugar-cane. The former considerable trade with Denmark has fallen off in late years, in 1907 being as follows: Imports, 24,000 kroner (1 krone = 26.8 cents); exports, 30,000 kroner.

DARTMOUTH COLLEGE. An institution of higher learning at Hanover, N. H., founded in 1769. The attendance in 1909 was 1193 students. The faculty numbered 102. The most important event in the history of the college during the year was the retirement of President William J. Tucker on July 15, at the close of the fiscal year, and the taking up of the duties of the position at that time by Ernest Fox Nichols (q. v.), formerly professor of physics at Dartmouth and later professor of experimental science at Columbia University. Dr. Nichols was inaugurated president on October 14, before a gathering of very great distinction, in which more than one hundred institutions of higher learning were represented. During the year the cornerstone of the new gymnasium was laid. The endowment of the college is between \$2,000,000 and \$3,000,000. The library contains 100,000 volumes. There were several important changes in the faculty during the year. The college lost by death Professor William Thayer Smith (q. v.), Dean of the Medical School, who died on September 17. Rev. J. H. Robinson was appointed to the Phillips professorship, which has been vacant since the resignation of Rev. A. W. Vernon in 1906. Professor W. H. Sheldon was appointed professor of philosophy to succeed Dr. H. H. Horn, who resigned to take up work at New York University. Professor C. N. Haskins was appointed assistant professor of mathematics. Professor Herbert D. Foster of the Department of History returned to the college after a sabbatical year in Europe. Mr. J. T. Keady was appointed by the Athletic Council to fill the newly created position of director of athletics.

DARWIN MEMORIAL. During the year 1908 Darwin memorial exercises were held, and others were planned for 1909 to commemorate the one hundredth anniversary of Darwin's birth, and the fiftieth of the appearance of the *Origin of Species*. Exercises of this sort were held by a large number of educational institutions and learned societies all over the world.

Of especial interest were the series of lectures on Darwinism given in South Africa by Professor J. A. Thompson, of the University of Aberdeen, and special meetings held at Baltimore on January 1 by the American Association for the Advancement of Science, and by Cambridge University during the last week in June. At the former, addresses were made by Professor E. B. Poulton of Oxford University, and by a number of eminent American students of evolution. These addresses have been published under the title of *Fifty Years of Darwinism*.

At Cambridge, the exercises were under the immediate direction of Christ College, in which Darwin was at one time a student. Delegates from foreign countries were formally welcomed as guests of the University by the Chancellor, Lord Rayleigh, on the afternoon of June 22. On the following day, addresses were made by Lord Rayleigh and by Professors Oscar Hertwig, Elie Metchnikoff, Henry F. Osborn, and Sir E. Ray Lankester. Professor Osborn, on behalf of the American delegates, presented to Christ College a bronze statue of Darwin by Couper, a replica of one in the American Museum of Natural History in New York City. Other meetings were held on the two following days, at which addresses were made, and degrees conferred. A volume of important essays, under the title of *Darwinism and Modern Science*, has been published in connection with this commemoration.

DAVIDSON, JOHN. An English poet and playwright, died by his own hand, in March or April, 1909. He was born at Barrhead, Renfrewshire, Scotland, in 1857, the son of an evangelical clergyman. His formal education was limited to one term (1876-7) at Edinburgh University. At thirteen years of age he entered the chemical laboratory of a sugar house at Greenock. From 1877 to 1889 he was engaged in teaching in various Scottish schools and colleges. In 1890 he went to London. He first came prominently before the public as a poet with the publication of *Fleet Street Eclogues*, in 1893, although he had previously published several volumes. These early works showed originality, charm, and power, especially in the ballad form. His first play was *Godfrida*, published in 1898. Davidson, always something of a radical, became more pronounced in this direction in his last years. He published a series of remarkable "documents," called "Testaments," in which he set forth his doctrine,—an "untempered realism and a kind of mad Nietzscheism." In these productions there was little exercise of his undoubtedly poetic talents. In addition to those noted, his chief productions were *New Ballads* (1896); *The Last Ballad and Other Poems* (1898); *The Testament of an Empire Builder* (1902); *The Testament of a Prime Minister* (1904); *Selected Poems* (1904); *The Theatrorocrat* (1905); *Fleet Street* (1909). He was the author also of a fine adaptation of Coppée's *Pour la Couronne*. Davidson disappeared on March 23, leaving a note which implied suicide. His body was found floating in the sea near Penzance on September 18, 1909.

DAVIS, MARY EVELYN (MOORE). An American writer, widely known by her pen-name, "Mollie E. Davis," died on January 1, 1909. She was born at Talladega, Ala., in 1852.

Among her published works are: *Minding the Gap, and Other Poems; Under the Man-Fig; Under Six Flags; The Wire Cutter* (1899); *The Queen's Garden* (1900); *The Price of Silence* (1907).

DE ARMOND, DAVID A. An American public official, Congressman from Missouri, died November 23, 1909. He was born in Blair county, Pa., in 1844, and was educated in the common schools and at the Williamsport-Dickinson Seminary. He removed to Missouri and practiced law at Butler in that State. He was elected to the State Senate and became a circuit court judge and supreme court commissioner of Missouri. In 1884 he was a Presidential elector. From 1892 to 1909 he was a member of Congress from the Sixth Missouri District. Mr. De Armond was one of the most conspicuous of the Democratic members of the House. In 1907 there was a movement to promote him to the party leadership to succeed John Sharp Williams. He was one of the most active of those in opposition to Speaker Cannon. Mr. De Armond came to his death by the burning of his residence, perishing with his grandson, whom he was trying to rescue.

DEATH RATE. See VITAL STATISTICS.

DELAWARE. One of the North Atlantic Division of the United States, and one of the thirteen original States. The total area is 2370 square miles, of which 1965 are land and 405 square miles water. Its population in 1900 was 184,700. According to the Federal estimate made in 1909 the population in that year was 199,353. The capital is Dover.

MINERAL PRODUCTION. The State is not notable for its mineral products, the most important of which is clay, which was produced in 1908 to the value of \$146,527, as compared with \$190,440 for the product of 1907. Granite is also produced. Among other mineral products are coal-tar, illuminating gas, coke, sand and gravel and sand-lime brick. The value of the mineral products of the State for 1908 was \$382,502, as compared with a value of the product in 1907 of \$431,438.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the important farm crops of the State in 1909 were as follows, according to figures of the United States Department of Agriculture: Corn, 6,200,000 bushels, valued at \$3,596,000, from 200,000 acres; winter wheat, 1,652,000 bushels, valued at \$1,718,000, from 118,000 acres; oats, 102,000 bushels, valued at \$49,000, from 4000 acres; rye, 14,000 bushels, valued at \$10,000, from 1000 acres; buckwheat, 40,000 bushels, valued at \$24,000, from 2000 acres; potatoes, 864,000 bushels, valued at \$622,000, from 9000 acres; hay, 109,000 tons, valued at \$535,000, from 109,000 acres. The State is favorably situated for market gardening, and there are produced annually about 20,000,000 quarts of berries of various sorts. Apple-growing has become the most profitable branch of fruit-growing in the State, and the canning industry is an important feature of the agriculture of the State. The number of farm animals has remained constant in recent years. The wool clipped in 1909 was 55,272 pounds.

FISHERIES. The value of the products of the fisheries of the State for the year ending December 31, 1908, was \$541,200. Of these the largest product in point of value and amount taken was in menhaden. Of this 59,815,400 pounds

were caught, valued at \$151,790. Next in order of importance was oysters, of which 154,600 bushels, with a value of \$111,990, were taken. Of oysters for seeding purposes, 193,200 bushels, valued at \$56,620, were caught. Following these in order of importance were squeteague or sea trout, 2,590,000 pounds, valued at \$29,190; shad, 869,800 pounds, valued at \$67,860; crabs, 3,178,300, valued at \$13,390. Among other fish taken in the State were striped bass, 52,500 pounds, carp, 132,800 pounds, and catfish, 150,700 pounds. Muskrat skins were also taken to the number of 76,089, valued at \$23,530. There were 65 vessels employed in the fisheries of the State, valued at \$279,565. The number of independent fishermen was 853, and the wage-earning fishermen employed numbered 903.

FINANCE. The report of the State Treasurer showed a balance in the treasury on January 14, 1908, of \$118,157. The receipts from January 14, 1908, to January 5, 1909, were \$722,170. The disbursements for the same period were \$840,327, leaving a balance in the treasury on January 5, 1909, of \$147,042. There were received in the general fund \$557,426 and there were disbursed \$496,991. The school fund amounted to \$944,407. The State debt on January 5, 1909, amounted to \$816,785.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the Delaware Industrial School for Girls; St. Michael's Day Nursery and Hospital for Babies; Delaware Society for the Prevention of Cruelty to Children; the Old Folks' Home at Dover, and the Delaware State Hospital at Franhurst. Appropriations made for the support of these institutions in 1909 were as follows: The Delaware Industrial School for Girls, \$3000; St. Michael's Day Nursery and Hospital for Babies, \$500; Delaware Society for the Prevention of Cruelty to Children, \$900; Old Folks' Home at Dover, \$2000; Delaware State Hospital at Franhurst, \$65,000. In addition, there were appropriated to purchase books for the blind, \$100; for deaf, dumb, blind and idiotic children, \$11,200; for the Delaware Commission for the Blind, \$1500; and for the Delaware State Tuberculosis Commission, \$15,000. The appropriation for deaf, dumb, blind and idiotic children is made to support such children outside of the State, there being no such institution in Delaware. The Delaware State Hospital is wholly supported by the State, and the appropriation for the blind covers all the expenses of their support, but in all other institutions there is private assistance. The State appropriation covers but a part of the requirements of the other institutions.

POLITICS AND GOVERNMENT. On March 1, the bill to resubmit the question of the licensing of the manufacture and sale of intoxicating liquors in rural New Castle County, which is now a license district, passed the General Assembly by a vote of 13 to 1. The bill was signed by Governor Pennewill. In 1907 two of the three counties in the State voted to do away with license,—Kent and Sussex. The two local option districts in New Castle County, Wilmington and the rural part of the county, voted for license. The action of the General Assembly noted above simply provides that the district of rural New Castle County shall have another opportunity to vote on the question in November, 1910.

The General Assembly appropriated \$15,000,

or \$5000 for each county, to be used for the building of tuberculosis sanatoriums, one of which is already in existence near Wilmington.

OFFICERS: Governor, Simeon H. Pennewill; Lieutenant-Governor, John M. Mendinhal; Secretary of State, William T. Smithers; Treasurer, David O. Moore; Auditor, Theo. F. Clark; Attorney-General, Andrew C. Gray; Adjutant-General, I. P. Weckersham; Commissioner of Insurance, Chas. H. Maull—all Republicans, except Gray, Democrat.

JUDICIARY. Supreme Court: Chancellor, Chas. M. Curtis, Republican; Chief Justice, James Pennewill, Republican; Associate Justices, Henry C. Conrad, Republican; Victor B. Woolley, Democrat; Daniel O. Hastings, Republican; William H. Boyce, Democrat; Clerk, Chas. H. Le Fevre, Democrat.

The State Legislature of 1909 was composed of 11 Republicans and 6 Democrats in the Senate, and 17 Republicans and 18 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

DENISON, CHARLES. An American physician, died January 10, 1909. He was born at Royalton, Vt., in 1845, graduated from Williams College in 1867, and from the medical department of the University of Vermont in 1869. After several years of practice in Hartford, Conn., he went in 1873 to Denver, because of pulmonary hemorrhage. He was for fourteen years professor of diseases of the throat and climatology in the University of Denver, and following his retirement was emeritus professor. Dr. Denison was a leader in the crusade against tuberculosis, and was a specialist in the treatment of that disease. In 1890 he was president of the American Climatological Association. Among his writings are *Rocky Mountain Health Resorts* (1876); *Exercise and Food for Pulmonary Invalids* (1895), and many articles and reports in periodicals.

DENMARK. A constitutional monarchy of Northern Europe. Capital, Copenhagen.

AREA AND POPULATION. Area, exclusive of dependencies, 15,385 square miles. Total population (1906), 2,605,268. The population is almost entirely Scandinavian. In 1907 the number of marriages was 20,103; in 1908, 19,956; births (including stillbirths), 76,151 and 78,077; deaths (including stillbirths), 39,089 and 40,917. Emigrants in 1907 numbered 7890; in 1908, 4558. The population of Copenhagen in 1906 was 426,540 (with suburbs, 514,134); of Aarhus, 55,193; Odense, 40,547; Aalborg, 31,509; Horsens, 22,327; Randers, 20,963.

EDUCATION. Primary education is compulsory. There were in 1906 about 3400 public elementary schools (38 in Copenhagen, 146 in other towns, and 3217 in rural districts), with about 341,000 pupils. The secondary schools, public and private, had an attendance of about 57,000. The University of Copenhagen, founded 1479, has five faculties, to all of which women are admitted on equal terms with men. Four to five hundred students matriculate annually. The Lutheran is the established religion; complete religious toleration prevails.

INDUSTRIES. Of the total area, 80 per cent. is productive, and one-sixth of the remainder is in peat bogs. The law prohibits the condensation of a number of small farms into one estate; the soil is therefore greatly subdivided.

The area under the principal crops in 1907 and the production were as follows: Oats, 403,050 hectares, 15,717,391 hectolitres (1 hectolitre = 2.838 U. S. bushels); rye, 276,011 hectares, 5,591,057 hectolitres; barley, 233,712 hectares, 8,634,553 hectolitres; wheat, 40,788 hectares, 1,539,308 hectolitres; beetroot, 228,756 hectares, 95,053,311 hectolitres; potatoes, 54,075 hectares, 8,459,315 hectolitres. In 1907, 7 sugar factories turned out 52,660 tons of beet sugar; in 1908-9, 64,000 tons; 27,110 tons of margarine and oleomargarine were manufactured at 16 factories in 1907. There were in 1908, 1345 creameries. These creameries are run on the co-operative plan, and the manufacture of butter for export is an important industry. The yield of the fisheries in 1906 was valued at 12,414,498 kroner; in 1907, at 13,587,472 kroner.

COMMERCE. In the general commerce, imports and exports in 1906 were valued at 725,626,000 kroner and 559,508,000 respectively (1 krone = 26.8 cents); 1907, 788,866,000 and 604,922,000; 1908, 709,423,000 and 550,654,000. In the general trade imports in 1907 and 1908 and exports in 1908 were valued in thousands of kroner as follows:

Countries	Imports		Exports 1908
	1907	1908	
Germany	257,837	237,921	121,221
Great Britain	135,008	109,304	336,825
United States	124,128	112,525	24,640
Russia	76,469	66,629	39,299
Sweden	67,173	58,103	46,671
Netherlands	22,918	17,678	2,481
France	17,278	16,424	658
Norway	13,655	10,795	21,999
Belgium	9,925	9,417	1,418

In the special trade, imports and exports were valued at 559,328,000 kroner and 393,512,000 kroner respectively in 1906; 1907, 681,129,000 and 416,863,000; 1908, 614,544,000 and 439,518,000. In the special trade the leading imports in 1908 were as follows: Cereals, 80,382,000 kroner; oil cake, 56,536,000; coal, 43,562,000; iron manufactures, 31,069,000; timber, lumber, etc., 25,002,000; woolens, 18,334,000; cotton and other vegetable textiles, 17,117,000; fats, 10,978,000; tobacco, 10,508,000; oil, 10,078,000; hides and skins, 9,499,000; seeds, 8,474,000; coffee, 8,062,000; fruits, 7,077,000; woolen yarn, 6,836,000; iron, 6,350,000; animals, 5,848,000; boats, 1,314,000. The principal exports in 1908 (special trade) were: Butter, 183,079,000; meat, 112,839,000; animals, 39,659,000; eggs, 27,418,000; hides and skins, 12,512,000; fish, 7,409,000; boats, 6,587,000; barley, 6,291,000; iron manufactures, 5,640,000.

COMMUNICATIONS. The total length of railways at the end of 1907 was 2083 miles; of which 1167 miles, valued at 221,506,211 kroner, belong to the state. Not including Copenhagen, Denmark had in 1907 4188 miles of road and 22,245 miles of byways. There were 1034 post-offices and 525 telegraph offices (state, railway, and private). The length of state telegraph lines (March 31, 1908) was 2320 miles, and the length of wire, 8781. The merchant marine, January 1, 1908, included 4321 vessels of 545,981 registered tons, of which 695 were steamers of 405,946 tons. During 1907, 35,147 vessels of 3,864,426 tons entered the Danish ports, and 36,635 vessels of 1,256,195 tons cleared; in the coasting trade, 36,142 vessels entered, and 35,792 cleared.

FINANCE. The actual revenue and expenditure in the fiscal year 1907-8 were 97,499,771 kroner and 94,119,618 kroner respectively; for 1908-9, 93,359,181 and 107,096,039.

For 1909-10 the estimated revenue was 93,448,885 kroner, and the estimated expenditure 102,256,833 kroner. The principal items of estimated revenue were: Indirect taxes (mainly customs and excise), 64,306,100 kroner; direct taxes, 15,161,000; interest, etc., 5,814,463; revenue from employment of property, 1,985,784; lottery, 1,555,000. The larger estimated expenditures were: Capital expenditure on public works, railways, etc., 15,896,879 kroner; war, 13,283,312; worship and instruction, 11,887,983; interior, 10,787,008; public debt, 8,340,659; marine, 8,304,906; justice, 8,039,391; finance, 6,121,745; pensions, 4,891,100; agriculture, 4,343,131; public works (ministry of), 1,294,233; civil list and appanages, 1,155,200. On March 31, 1909, the external debt stood at 166,127,250 kroner; internal debt, 87,816,909; total, 255,933,203. The emergency reserve fund (which amounted to 116,246,060 kroner in 1867, 38,365,915 in 1877, and 17,820,879 in 1887) stood at 17,897,222 kroner on March 31, 1909.

The national debt, March 31, 1908, stood at 255,933,203 kroner (foreign, 167,827,250), mostly at 3 per cent. The accounts of the National Bank balanced, July 31, 1908, at 189,374,884 kroner; the assets included 82,402,429 kroner in bullion and specie, and the liabilities included 133,000,000 kroner note issue, 27,000,000 capital, and 3,000,000 reserve fund. Other banks to the number of 130 transact the ordinary business of the country. There were, March 31, 1907, 516 savings banks, with 1,240,739 depositors and deposits amounting to 717,443,586 kroner. The value of coin minted in 1908 was: Gold, 5,926,990 kroner; silver, 808,915; bronze, 129,967; total, 6,865,872.

NAVY. The effective navy in 1909 included 4 monitors, 3 torpedo gunboats, 14 first-class torpedo-boats, and 1 submarine. There is a considerable number of old vessels of little or no fighting value.

ARMY. As provided by the military laws of 1909 the Danish army, a national militia in which service is compulsory, comprises two corps. It receives annually 8000 recruits for the infantry, serving 163 days; 272 for the guard, serving 150 days; 380 for the cavalry, serving 200 days; 270 for the train, 792 for the field artillery, serving one year as drivers or 280 days in the ranks; 800 serving 1 year in the coast artillery, 300 serving in the engineers for 210 days, 60 in the technical branches for 13 months, 50 in the commissary department, serving 125 days; and 120 in the medical corps, serving for 230 days. The new organization would give a total of 52 battalions, 31 of the line and 21 of the reserves of four companies each for the infantry in place of 44 battalions, 4 regiments (2 having 1 squadron of the reserves) of three squadrons, or 12 instead of 15 squadrons, 24 batteries of field artillery in place of 16, 18 batteries of coast artillery as previously and 12 companies of engineers instead of 9. General Lütken commanding the army corps of Zealand was replaced by General Görts.

GOVERNMENT. According to the present Constitution, the executive authority is vested in the King and his responsible ministers, and the

legislative power in the Rigsdag, a body composed of a Senate (Landsting) and a House of Commons (Folkething). The Landsting has 66 members, 12 nominated by the Crown, the remainder elected indirectly. The Folkething consists of 114 members, elected by universal suffrage. The present King, Frederick VIII., was born June 3, 1843; married, July 28, 1869, to Princess Louisa of Sweden and Norway; succeeded to the throne January 20, 1906. Heir apparent, Prince Christian, born September 26, 1870. The Ministry of October 23, 1909, was constituted as follows: President of the Council and Minister of Justice, C. Th. Zahle; War and Marine, C. Krabbe; Foreign Affairs, E. J. C. Scavenius; Agriculture, Paul Christensen; Worship and Instruction, M. C. B. Nielsen; Public Works, J. J. Jensen; Interior, Dr. P. R. Münnich; Finance, Dr. C. E. C. Brandes; Commerce and Navigation, V. H. O. Weimann; Minister for Iceland, Bjorn Jonsson.

COLONIES. The colonial possessions of Denmark are: Iceland, Greenland, and the Danish West Indies (qq. v.).

HISTORY. As in the previous year the main question in Danish politics was that of defense. The government's defense plan was submitted on February 12. This provided for fortification both by land and sea and called for twenty torpedo-boats, six submarines, the improvement of the mines and other means of defense. To carry the plan into effect 42,200,000 kroner were required at once and an annual increase of 3,327,000 kroner in the military budgets was proposed. M. Christensen, the former Premier, however, whose following was considerable, complicated matters by a speech in which he differed from the government's proposals as to the land fortifications of Copenhagen. On May 25 the general elections were held. They turned on the issue of land fortifications for Copenhagen. The Conservatives in general favored these fortifications as part of a system of defense that should be strong enough to prove that Denmark was able to enforce her neutrality. The Socialists on the other hand held that expenditure for this purpose was wasteful since Denmark was too weak to defend herself in the event of war. Moreover the ultimate aim of the Socialist policy was disarmament. The effect of the elections was in general to favor the Moderate Left then in power, but it could not command a majority for its defense scheme except by a combination with M. Christensen and his followers. On July 31 the Cabinet resigned. It held office for a short time afterwards at the request of the King, but in August a new Cabinet was formed under Count Holstein-Ledreborg, who had retired twenty years before and was seventy years of age. The new Ministry included both the former Premiers, Neergaard and Christensen and was agreed on the general policy of improving Copenhagen's land defense, but with modifications to comply with the demands of M. Christensen. The reappointment of Christensen caused great indignation, except among his personal followers, on account of his relation to the Alberti scandal of the previous year, and in October he resigned his portfolio as Minister of National Defense on account of the public demonstrations against him. The King appointed Premier Holstein-Ledreborg to that post. Meanwhile, on September 24, a compromise defense scheme representing an agreement between MM. Christensen and Neergaard was passed by Parliament. It provided for strong sea defenses for Copen-

hagen, but left the land defenses of the 'eighties, though strengthened somewhat by two new so-called sea forts. This did not go far enough for the Conservatives who wished strong defenses in the spirit of Denmark's treaties, and went too far for the Socialists who desired disarmament. A new Cabinet crisis occurred in October, the Extreme Right and Left having joined in attacking the Premier and finally having carried a vote of no confidence. The Premier resigned and a Radical Ministry succeeded under M. Zahle. Its position was precarious as it was supported only by a small portion of the Folketing. The charges against the former Ministers MM. Christensen and Berg on account of their relations with the Alberti scandal raised the question of impeachment. A committee of the Folketing, appointed to consider the matter, reported on December 1 in favor of their arraignment before a judicial body of the state. The Zahle Cabinet (see preceding paragraph on Government), was the fifth Cabinet that Denmark had had in less than a year and a half. It was the first Radical Cabinet in her history, and the only one that had to rest for its support on the Socialists. Fear was expressed that the new Ministry would endeavor to obstruct the execution of the defense laws, but the Minister of Finance announced early in November that the government would carry out these measures. Iceland's dissatisfaction with the terms of her present relations with Denmark was again manifest in 1909. Early in the year the Icelandic Minister in the Danish Cabinet resigned. The Icelandic members of the recent commission with one exception favored Icelandic autonomy, leaving the mother country to control only matters of foreign policy and national defense. In the Icelandic elections the party that wished Iceland to be united with Denmark only in the person of the King received the majority of votes. In July the King and Queen visited the Czar at Peterhof.

DEPOSIT GUARANTEE. See BANKS and BANKING.

DES MOINES, IOWA. See ELECTORAL REFORM.

D'ESTOURNELLES DE CONSTANT, PAUL HENRY BENJAMIN. A French publicist and diplomat, awarded on December 9, 1909, the Nobel prize for the advancement of peace. He was born at La Flèche in 1852 and was educated at the Lycée Louis-le-Grand, Paris, where he became a graduate in law and took the diploma of the School of Oriental Languages. He entered the diplomatic service and reached the highest rank in it, being for some time French Ambassador to England. He then entered home politics, serving as deputy for the Sarthe from 1895 to 1904, when he was elected senator. He participated in the two peace congresses held at The Hague, and took an active part in other congresses for the advancement of peace in Europe and the United States. Among his published writings are treatises on the French protectorate over Tunis, on provincial life in Greece and on the religious congregations of the Arabs; also two plays on classic themes, *Galatée* and *Pygmalion*.

DHANIS, BABON. A Belgian explorer, died November 13, 1909. He was born in 1859, and received his early education in Greenock, Scotland. He entered the Belgian army in 1884, and took part in the efforts which were being made by King Leopold of Belgium to found stations

on the shores of Lake Tanganyika. He soon after proceeded to the Congo and was active in extending the influence and rule of the state. In 1888 he founded several stations on the northern bank of the Middle Congo and in 1890 he explored the Stanley Falls region to the river Kwango, establishing several new stations. In 1892-3 he conducted a campaign against Arab slave raiders, who, after Stanley's rescue of Emin Pasha, had established themselves along the Falls and at Nyangwe and Kasongo, which had become flourishing towns strongly fortified. They dominated the whole region. In 1892 these Arabs attacked an expedition under Commandant Dhanis which was proceeding southward to Katanga. The latter diverted his march to the east and with strong reinforcements attacked both Nyangwe and Kasongo. These operations, extending over 1892-3, involved great slaughter on both sides; but in the end, Dhanis inflicted complete defeat on the Arabs and utterly destroyed both towns, thus establishing the supremacy of the rule of the Free State. On his return to Belgium he was raised by the King to the rank of baron. Returning to the Congo the next year he was made vice-governor in 1895. In 1896-7 he took a leading part in the great expedition towards the Nile, during which his troops mutinied, killed several officers, including Dhanis' brother, and compelled the expedition to retreat toward the Congo. It was with great difficulty that the mutineers were subdued and comparative order restored. The last years of his life Baron Dhanis lived in retirement in Belgium.

DICKINSON, JACOB McGAVOCK. An American lawyer, appointed Secretary of War in 1909. He was born in Columbus, Miss., in 1851. At the age of 14 he enlisted in the Confederate army. He graduated from the University of Nashville in 1871, and studied law at Columbia University and at Leipzig. After his admission to the bar he practiced in Tennessee. In 1895-7 he was Assistant Attorney-General of the United States. By special commission he served on several occasions on the supreme bench of Tennessee. In 1903 he served as counsel for the United States before the Alaskan Boundary Commission, and was paid a high tribute by Baron Alverstone, Lord Chief Justice of England, umpire of the tribunal. In 1899 he became general counsel for the Illinois Central Railroad Co., a position which he held when invited by President Taft to become Secretary of War in his cabinet. Mr. Dickinson is a Democrat of the conservative type. He was president of the American Bar Association in 1907-8, and is considered one of the most able and eminent lawyers in the United States.

DISCIPLES OF CHRIST, known also as Campbellites, after Alexander Campbell, of Bethany, West Virginia. In 1811 the first church was organized and the body may be dated as a distinct organization from 1827. The denomination has had a rapid growth. The total number of communicants in 1909 was 1,217,976. These were in the United States. There were in all countries, 1,329,559. There were 10,522 churches and 5985 ministers. There were en-

rolled in the Bible schools of the denomination 912,859 pupils. The value of the church property was \$28,031,520. The churches of the denomination lie chiefly in the Middle West and South, although it is represented in every State in the Union with the exception of two. There are many churches in Australia and other parts of Great Britain. Churches also exist in Cuba, Philippines, Canada and Scandinavia. Missionary work is carried on in Japan, China, India, Philippines, Hawaii, Cuba, England, Norway, Sweden, Denmark and Porto Rico. The receipts for foreign missions in 1909 were \$350,685. Twelve new missionaries were sent out in 1909 and a number of others are under appointment. The Foreign Missionary Society supports 17 medical missionaries and 17 hospitals and dispensaries, and in 1909 treated 131,770 patients. The American Christian Missionary Society conducts the domestic missions of the denomination. This Society received for its work in 1909 \$118,756. During 1909 the Society aided in the support of 386 workers in the field. There is also a Christian Women's Board of Missions which supports missions at home and abroad. The Disciples rank third among the churches in the number of Christian Endeavor Societies. They have also many strong educational institutions as Bethany College, West Virginia; Hiram College, Ohio; Transylvania University, Lexington, Ky.; Drake University, Des Moines, Ia.; Butler University, Indianapolis, and Christian University, Canton, Mo.

The centennial celebration of the founding of the denomination was held in Pittsburg from the 11th to the 19th of October. It was one of the largest religious conventions ever held and it was estimated that some 50,000 people were gathered together. At the open-air communion service between 25,000 and 30,000 persons were present. The most notable address was that of Col. S. H. Church, a layman. He urged that the spirit of Alexander Campbell and his colleagues be given greater sway in dealing with the problems of the day; that insistence on immersion as a requisite for discipleship be frankly abandoned by the Disciples; that the principle of religious union be frankly acknowledged as including the Roman Catholic and the Jew; that the Disciples accept the knowledge that modern criticism of the Bible has brought; and that they cease to build churches in small communities already supplied with churches bearing other names. This address aroused great opposition among the delegates and a resolution was passed specifically disavowing the conclusions which Colonel Church reached.

DISTRICT OF COLUMBIA. That portion of the Federal domain which is the seat of government of the United States. It is coextensive with the city of Washington. The District was organized on March 30, 1791, when a concession of land amounting to 100 square miles was made to the United States by the States of Maryland and Virginia. The gross area is about 60 square miles, as a portion of the original cession was re-ceded to Virginia in 1846. A census of the District was taken on April 1, 1909, and showed a total population of 343,003, including 99,142 colored.

FINANCE. The receipts from all sources during the year were \$14,168,448. This includes a cash balance left from the fiscal year 1908 of \$331,187. The expenditures were from the District of Columbia appropriations, \$12,654,624, and

from the special trust fund, \$1,147,749, leaving an unexpended balance at the end of the fiscal year 1909 of \$366,074. The chief sources of revenue are taxes, trust and special fund collections, and United States payments from appropriations under the act of 1878.

EDUCATION. The largest amount of the estimates for appropriations are made for the maintenance of the public schools. During the fiscal year ended June 30, 1909, six school buildings were completed and progress was made upon seven others authorized by Congress. The total enrollment of pupils in that year was as follows: Day schools, 54,592; night schools, 3792, a total of 58,384. The number of teachers in the day schools was 1628 and in the night schools, 101. A system of medical inspection is maintained in the schools and during the school term 1908-9 the twelve medical inspectors made 9197 visits to school buildings.

MUNICIPAL CONDITIONS AND PROGRESS. In accordance with recommendations of the Commissioners made in their annual report of 1908, Congress enacted a bill whereby the jurisdictions of the several Justices of the Peace were combined in the municipal court, the duties of which were defined in the statute. The court was established February 17, 1909, and the record which it made during the year fully justified the enactment of the law.

The Juvenile Court, created by Congress, has also justified its establishment as a necessary part of the machinery for dealing with delinquent and dependent children. During the fiscal year 2546 children were brought before the Juvenile Court and disposed of by it under the law. In addition 929 adult cases, chiefly for the non-support of wife or children or both, were passed upon and 824 cases were disposed of under the child labor law.

A larger use of public playgrounds of the District was made during the year 1909. There were nine municipal playgrounds operated in 1909 with 390,871 attendances.

During the year twenty miles of sewers were constructed. The total length of sewers in the District on June 30, 1909 was 541.26 miles. During the year 3988 trees were planted, an increase of 659 over the preceding year.

The Commissioners of the District in their annual report recommended that additional parks should be established. The only large public reservation is Rock Creek Park, which contains about 1605 acres. The plans of the Senate Park Commission provided for the establishment of a chain of parks in that portion of the District outside the city limits and connecting them by parkways or boulevards. The Commissioners also called attention to the urgent need for the improvement of the harbor front, especially along the Washington channel.

MISCELLANEOUS. In accordance with the action of the President in approving the suggestion, the District of Columbia will hereafter be represented at the Military and Naval Academies. The Commissioners will have the power to appoint candidates after competitive examination. By authority of Congress the Commissioners in April, 1909, removed the remains of Major Pierre Charles L'Enfant, the architect of the Capitol, from Green Hill, Maryland, where they were buried in 1825, to the Arlington cemetery.

DODGE, THEODORE AYRAULT. An American soldier and military writer, died October 26,

1909. He was born in Pittsfield, Mass., in 1842, and received his military education under Major-General von Frohreich of the Prussian army in Berlin, and graduated from the London University in 1861. Returning to the United States he volunteered in the Union army and served as first lieutenant in the 119th New York Infantry. He received wounds at Manassas and Chantilly. At the battle of Gettysburg he lost his right leg and was captured. Following the war he served in the Paymaster-General's office at Washington and was mustered out of the volunteer service in 1866. He was then appointed captain in the 44th regular infantry and retired for disability in 1870. In 1904 he received the rank of major and was brevetted colonel of volunteers and lieutenant-colonel in the regular army for his Civil War services. He was well known as a writer on military subjects. Among his published works are: *History of the Art of War—Alexander, Hannibal, Caesar, Gustavus Adolphus, Napoleon* (12 vols., 1890-1907); *The Campaign of Chancellorsville* (1881); *Bird's-eye View of our Civil War* (1883); *Patroclus and Penelope* (1885); *Great Captains* (1889); and *Riders of Many Lands* (1894). He also contributed essays, reviews, and occasional verses to magazines.

DODS, MARCUS. A minister of the United Free Church of Scotland, died April 26, 1909. He was born in 1834 at Belford, Northumberland, graduated from Edinburgh University in 1854, and studied divinity at New College, 1854-8. From 1864 to 1889 he was pastor of Renfield Free Church, Glasgow, and in the latter year became professor of New Testament theology in New College, Edinburgh. He wrote among other works: *The Prayer that Teaches to Pray* (1863); *Epistles to the Seven Churches* (1865); *The Parables of Our Lord*, 2 series (1883-5); *How to Become Like Christ* (1897); *Forerunners of Dante* (1903); *The Bible; Its Origin and Nature* (1905). Dr. Dods contributed articles on religious subjects to the *Encyclopædia Britannica* and to various periodicals.

DOHRN, ANTON. A German zoölogist, died September 30, 1909. He was born in 1840 at Stettin. He studied the natural sciences under Haeckel in Jena, where he subsequently became privat-doctor. He made important investigations of marine animals, especially crustaceans, and made journeys to the coast of England and to the Mediterranean for the purpose of studying them. He established in 1870 a zoological station at Naples, the first and most important institution of its kind. Among his published writings were: *Der Ursprung der Wirbeltiere* (1875); and *Studien zur Urgeschichte des Wirbeltierkörpers* (1882).

DOMINICA. A West Indian island belonging to Great Britain; one of the five presidencies of the Leeward Islands (q. v.). Area, 291 square miles; population (1901), 28,894. Capital, Roseau, with about 6000 inhabitants. There is a Carib settlement with about 400 inhabitants. The imports amounted (1908-9) to £153,114; the exports, chiefly cacao, coffee, and fruits, to £112,013. The local revenue and expenditure for three successive years are given as follows: 1906-7, £34,149 and £31,055; 1907-8, £39,865 and £31,486; 1908-9, £42,147 and £37,178. The public debt stood (1909) at £50,350. There is an executive council and a legislative council. The President is W. Douglas Young.

DOMINICAN REPUBLIC. See SANTO DOMINGO.

DRAINAGE. The great activity in extending the agricultural areas in the United States by both irrigation and drainage, which has been so marked for the past few years, continued during 1909. It was estimated by the Secretary of Agriculture in 1908 that there had been drained in the several States, under local drainage laws, an area of 15,889,000 acres. This area has been greatly extended during the year 1909, the largest areas being in Iowa, Missouri, Arkansas, Louisiana, Florida, and North Carolina. The State of Florida has undertaken the drainage of the Everglades, and much of the land in this great swamp has been sold to companies, which are putting it on the market for settlement. North Carolina enacted a drainage district law, which has made possible the drainage of large areas in the coastal plains of that State.

Perhaps the greatest activity in the drainage of wet lands outside of the United States is in Italy in the eastern part of the Valley of the Po. This work is done principally by the general government, which exercises control over all drainage work. Drainage works are divided into two classes, the first class including those which are built primarily for the improvement of hygienic conditions and those which in addition to improving agricultural conditions will improve the hygienic conditions. Works of this class are built by the general government, which bears six-tenths of the expense, the remaining cost being distributed as follows: One-tenth by the province or provinces interested; first, by the commune or communes interested; and second, by the owners of the lands benefited. The second class includes all drainage works which do not come within class one, and they are built by the land-owners at their own expense, under concessions granted by the government. The laws provide for the organization of drainage districts, and the making of loans to such districts by the state bank of deposits and loans. The government has appropriated funds for the construction of drainage works to be expended during the years 1900 to 1933, the total sum being about \$40,000,000. The law provides for the expenditure of two-thirds as much more, or nearly \$27,000,000, by the provinces, communes, and interested land-owners.

It is estimated that there are 16,000,000 acres of land needing drainage in France, and the French government is encouraging its reclamation by building some of the more important works, by providing for loans for their construction, and by maintaining a technical force which is at the service of those wishing to construct drainage works.

Russia in Europe contains about 160,000,000 acres of swamp land, most of which is in the northern part of the country. Large areas have been drained by the government, the principal tracts being in the vicinity of St. Petersburg and in Poland. In Poland the area affected by the canals built is about 7,500,000 acres, about 1,000,000 acres of marsh land having been turned into farms, the remainder being timbered lands which have been rendered accessible by drainage. In the provinces of St. Petersburg, Novgorod, and Pskov the area of swamp lands is about 10,000,000 acres, of which 330,000 acres has been drained. The Russian government is draining large areas also along

the Trans-Siberian Railway, to promote colonization.

DRAINAGE OF IRRIGATED LANDS. In all countries where irrigation is practiced extensively, large areas of lands have been damaged by the rise of ground water and the accumulation of alkali due to evaporation from the wet soil. In the United States, up to the last few years, the practice has been to abandon such lands when they became unproductive, and bring into cultivation new lands on higher levels, but the expense of this proceeding has brought about efforts to reclaim the ruined lands. The United States Department of Agriculture has carried on experiments to work out methods of relieving such lands of both surplus water and alkali. It has been shown that the installation of under drains which will hold the ground water below the root zones of plants will prevent damage from water, and that repeated applications of water alternating with deep cultivations after under drains have been put in, will in a season or two leach out the salt so that the lands will again produce crops. It is usually the low lands which suffer most, and often gravity outlets for the drains are not available. Under such condition it is necessary to drain the water to sumps, from which it is pumped into canals or rivers above the level of the drained lands. The area of lands in the irrigated parts of the United States which are drained in this way is not large as yet, but it is being recognized that irrigated lands, to be permanently productive must have good drainage, either natural or artificial, and many of the larger irrigation projects now being developed include in their plans complete systems of drains.

The same conditions have been found in Egypt and India by the English engineers. Practically all of the land in the delta of the Nile must be drained continuously as well as irrigated to prevent the accumulation of alkali. Most of this drainage water is pumped. The lands in Upper Egypt have natural drainage.

Throughout the world the reclamation of swamps and wet lands offers an easy means of extending the agricultural areas. These lands are usually fertile, and require only to be relieved of their surplus water or to be protected from overflow to become among the most productive lands.

DRAMA. By far the most important event of 1909 in the history of the stage in the United States, was the opening of the New Theatre in New York City, an establishment founded and equipped by a number of rich New Yorkers, whose hope is that it will accomplish for the American stage what the Théâtre Français does for that of France, or the Burg Theatre for that of Austria. The fact that fully half the plays produced upon the American stage are of foreign origin, English, French, or German, and that the actors are often foreign-born, makes it the more imperative that the productions and the acting in some one American theatre shall be recognized as establishing a standard of excellence. It is understood that in the New Theatre plays will be given without regard to the question asked first with regard to any play by any manager: Will it pay?

The directions given to Mr. Winthrop Ames, manager of the New Theatre, and his associate, Mr. John Corbin, to whom falls most of the work of selection, are virtually to produce in

the worthiest manner possible, such plays as in their judgment ought to be produced. The financial result is a secondary consideration.

The New Theatre, the most costly and elaborate playhouse in America, was opened in November, 1909, with fitting ceremony. The building, designed by Messrs. Carrère and Hastings, occupies a plot facing Central Park and is dignified in design and beautiful in detail. It seats about 2500 persons. Unfortunately the acoustics are not good and radical changes in the auditorium may have to be made.

The opening play was Shakespeare's *Antony and Cleopatra*, with Mr. E. H. Sothern and Miss Julia Marlowe in the chief parts. It was received by the public with respectful consideration, but no enthusiasm. Other plays given later were: *The Cottage in the Air*, by Edward Knoblauch, a light comedy concerned with the adventures of a German princess who flees from court etiquette to an English village, with more or less amusing results; *Strife*, a play of contest between capital and labor, by the Englishman, John Galsworthy, who makes his story vivid and dramatically effective; *The Nigger*, a drama dealing with the race problem. The leader of the Southern community in which he lives, engaged to marry a woman full of Southern prejudice, discovers that he has negro blood in his veins. Sheridan's *School for Scandal* was revived, but not in a manner to reflect credit upon the establishment. *Don*, a farce-comedy, by Rudolph Besier, an English author, proved to be amusing in spots.

The company engaged at the New Theatre includes a number of competent actors, among whom are Messrs. E. H. Sothern, Louis Calvert, Rowland Buckstone, Ferdinand Gottschalk, Matheson Lang, Guy Bates Post, and Jacob Wendell, Jr., Mrs. Harriet Otis Dellenbaugh, Mrs. Sol Smith and the Misses Julia Marlowe, Rose Coghlan, Annie Russell, Jessie Busley, and Leah Bateman-Hunter.

If the plays produced at the New Theatre in 1909 did not achieve the measure of success hoped for, they received respectful consideration. When the acoustics of the house have been improved and the company has had time to "find" itself, there is reason to expect results along the lines laid out by the founders of the enterprise. More than two thousand new plays were received for examination at the New Theatre during the year, of which less than a dozen were found to warrant serious consideration.

In the field of tragedy the year was almost barren. Of ambitious purpose and some artistic success was Mr. William Faversham's production of Stephen Phillips's *Herod*, a play long recognized as containing remarkable beauty, but which American managers had been averse to trying. Mr. Faversham, an actor of too light calibre for the part of Herod, deserves commendation for his serious and dignified treatment of the play. In the last scene of the drama he gave a picture of the crazed king that was theatrically admirable, especially as coming from an actor whose best work has been done in comedy. Mr. Robert Mantell revived Shakespeare's *King John*, which was almost a novelty to the present generation of playgoers. His own work was respectable, if not inspiring. For the rest the revival only served to show once more how futile it is to look today for actors competent in classic drama. Farce comedy in slang offers no training for tragedy in verse.

Copyright, 1909, by The New Theatre, New York

THE NEW THEATRE, NEW YORK
INTERIOR WITH GUESTS' BOX IN CENTRE

Miss Maude Adams, in an English version of Schiller's *Joan of Arc* in the Stadium of Harvard University at Cambridge, succeeded at least in presenting a series of stirring pictures, splendid in color and movement. Her Joan was astonishingly effective, considering this delightful actress's physical limitations. Nature has not cast her for heroic parts. The play was splendidly given from the spectacular standpoint by the small army of more than a thousand persons employed in it.

In the field of serious drama another play by Eugene Walter, entitled *The Easiest Way*, held the New York stage for the entire year. Mr. Walter, in his *Paid in Full*, a drama of some power and much theatrical vividness, had already proved his right to serious consideration. No young man seems to have a greater faculty for the invention of effective situations or better instinct for their presentation. It is therefore the more to be regretted that in *The Easiest Way*, a really powerful play, Mr. Walter wastes his gifts, so far as any moral lesson goes. He sketches the downward career of a girl whose instincts are good, but who succumbs to temptation under stress of poverty and takes "the easiest way." The play owed its great popular success to the vivid realism of the several types employed—the girl herself, admirably acted by Miss Frances Starr; the rich man-about-town, sensuous, good-humored, brutal in his relations to women, but open-handed; the honest lover who is willing to forgive much, but not everything; the parasites who, in certain circles, stand always pointing toward this "easiest way," and so on through a long list of figures, all sketched with extreme cleverness. The brutal frankness of the dialogue led more than one critic to denounce the play as indecent. Mr. Walter in reply has asserted that he has simply exposed one case of a thousand, and that if he can make people take up the problem some remedy may be suggested. As a playwright he suggests none, and the impression remains that too often the easiest way is the only way.

In welcome contrast to the sordid grip of *The Easiest Way*, was the delightful comedy of Jerome K. Jerome, *The Passing of the Third Floor Back*, which, after a long period of success in London, was transplanted to New York with Mr. Forbes-Robertson in the leading part. It is an entertainment rather than a play, a succession of short scenes, almost unrelated, and portrays the power of one sweet nature to leaven an astonishing mass of viciousness. The scene is a middle-class London boarding house in which are a landlady who has seen better days, a "slavey" with a heart, a broken-down army officer ready to sell his daughter to a drunken gambler, a Jew swindler, a "painted lady," who with cosmetics and false hair, defies time, and several other types of vicious selfishness, all shallow, all scheming in a thousand petty ways to appear what they are not. Into this house comes a stranger, who brings to the surface the grain of good in each of the poor wretches and makes it grow with wholly improbable but highly amusing results. The roué repents of his pursuit of the "slavey," the landlady becomes honest in her dealings, the girl about to sell herself to the gambler finds an honest lover, the painted lady drops all her shams, the Jew swindler turns over a new leaf, and when the stranger leaves, the house has been transformed for the better. It is all im-

possible, but delightful, full of exquisite touches of humor and pathos; and it is gratifying to add that the public crowded the theatre for month after month.

Several dramas from French sources have made an impression during the year. Mr. David Belasco, whose stage-craft counted for much in the production of *The Easiest Way*, brought forward an adaptation of *Le Lis*, by MM. Wolff and Leroux, under the title of *The Lily*, in which one scene, with Miss Nance O'Neill as the central figure, was acclaimed as a masterpiece of dramatic power. The conditions set forth are essentially European, but sufficiently clear to be understood here. A woman of the upper classes has been sacrificed to the prejudices of her caste; she has lost youth, love, happiness, because caste prejudices and parental selfishness stood in her way. When she sees her younger sister, to whom she has been a mother, about to be sacrificed in similar fashion, she turns upon her family and in a fierce outburst claims for the sister the right to love as her birthright. Miss O'Neill's passionate denunciation of the system under which her life had gone to waste was a fine bit of work that went far to justify many persons in their high estimate of this actress, whose past successes have been won outside of the metropolis.

M. Bourget's *Divorce* was also heard here in an English version by Mr. Stanislaus Stange. Notwithstanding the brilliancy of the dialogue—the play is mostly talk—it failed to interest an American audience. In France, where the divorce problem is a vital one, the tangle in which a dozen persons are involved was interesting. Even the fine art of Miss Mary Shaw failed to make this English version a success.

Still another play, in which a single scene of power saved a production that might otherwise pass unnoticed, was the late Clyde Fitch's *The City*. By common consent, this has been acclaimed as the strongest work of a playwright whose ceaseless activity resulted mainly in plays of purely ephemeral interest. *The City* gives a realistic picture of the miseries and dangers that may befall those who forsake the safety of rural life for the glare of the large town, with incidentally an unpleasant episode in family relationship that might happen anywhere. When a man discovers that the girl he loves is his half-sister, the drama ends in tragedy. Mr. Tully Marshall, as an unfortunate victim of vicious heredity, played with uncommon power.

The Writing on the Wall, a drama by William J. Hurlbut, in which the English actress, Miss Nethersole, appeared, was an indictment of Trinity Corporation for alleged neglect of the tenement house laws with regard to fire protection. The little son of a rich owner of tenements is burned to death in one of his father's death-traps. The father has refused to heed the warnings of the proper authorities and has declined to put in certain fire escapes. As a lesson the play had a certain value. Miss Nethersole as a bereaved mother was moving in some scenes of agonizing grief despite a tendency towards cloying sentimentality. The atmosphere of the drama was too uniformly depressing to hold public attention for long.

A play in which police procedure was vehemently attacked was Charles Klein's *Third Degree*. An unfortunate and innocent man sus-

pected of murder is forced by police baiting into admissions that have the weight of a confession of guilt. He is really hypnotized by the masterful and brutal insistence of an examining police captain determined to prove him guilty. Of course in the end his innocence is shown. It has been contended that the grueling police examination known as the "third degree" is unfair to the prisoner and often results in injustice. Mr. Klein put his case strongly, and had the help of two excellent actors, Mr. Wallace Eddinger and Miss Helen Ware, in making it appealing to the public.

The Vampire, by Messrs. Woolf and Viereck, had an idea that might have proved of more dramatic value if better developed. The theme is the absorption and theft of a man's literary ideas by a stronger nature. It was crudely worked out. Mr. Robert Hilliard found popularity in a curious melodramatic medley entitled *A Fool There Was*, by Porter Emerson Browne, in which dramatic exposition is given to Mr. Kipling's little poem of the Vampire woman and her victim. A husband blessed with an angel wife and child, strays after the temptress, who lures him to destruction. It is trivial, but calls for mention as one of the plays with a moral—that husbands should not play with fire in the shape of dangerous ladies—which survived the season.

The suffragette movement brought to the surface a play from England by Miss Elizabeth Robins called *Votes for Women*. Miss Mary Shaw as a woman who converts to the cause the man who has wronged her, was a strong figure in scenes that had far more interest in England than here, where the political allusions were but vaguely understood. In *Great John Ganton*, a dramatization by J. Hartley Manners, from a novel by Arthur J. Eddy, a good actor, Mr. George Fawcett, failed in a poor play. The hero, a hard-hearted business giant of the Chicago stockyards, is inhumanly severe upon his sentimental son and the son's sweetheart until paralysis and the sweetheart's tender nursing melt a stony heart.

A play by Israel Zangwill, called *The Melting Pot*, was based upon the theory that America is God's crucible in which various races of Europe are fused and improved. Out of the pot, into which go the German, the Frenchman, the Irishman, the Jew and all the others, comes the American. This is Mr. Zangwill's theme, which he develops with much ingenuity, but with too obvious a reliance on sentimental and patriotic rhetoric.

Cameo Kirby, by Messrs. Booth Tarkington and Harry L. Wilson, was a sketch of the old-time Western gambler, three parts rascal and one part hero, who flourishes in cheap fiction. The baleful influence of the counting room upon the editorial conscience in newspaper offices was brought up in *The Fourth Estate*, by Joseph Medill Patterson and Harriet Ford. A young editor sacrifices love and fortune rather than suppress an article he considers unjust. The inference drawn from the play is that newspaper owners are heartless, mercenary wretches, and that editors are too often their unwilling slaves. As originally presented, the young editor inserts the article so obnoxious to his employer and blows his brains out; but the supposed clamor for a happy ending led to a change and the editor steals away with the girl of his choice.

Another drama of far more importance, in which the happy ending mars a strong conclusion, was Henry Bernstein's *Israel*, of which an English version made a deep impression, although the theme—the wicked folly of Jew-baiting in polite society—has less interest in France than here. In the original Paris version the play ends logically in the suicide of a weakling; in answer to petitions from the American producer, Mr. Bernstein, probably with a shrug of his shoulders over "these queer Americans," lets him live and laugh.

In the list of new dramas that made some impression during the year, Mr. Augustus Thomas's *The Harvest Moon* deserves a place for its clever treatment of its central theme, the power of suggestion. Suggest to a man with sufficient insistence that he must go wrong or right, and the chances are that he will follow the suggestion. In this case it is suggested to a young girl that she must go wrong because her mother did so before her.

In light comedy the best offerings of the season came as usual from across the water. Mr. John Drew was fairly amusing in *Inconstant George*, from the French of MM. Flers and Caillavet. As a young man who falls in love with every woman he meets he made as much as possible of its farcical complications. In Mr. W. S. Maugham's *Penelope*, Miss Marie Tempest brought a delightful art to the help of slender material. Mr. Laurence Irving presented an adaptation of M. Brieux's *Hanneton* as *The Affinity*, a comedy with the trite lesson that illicit unions lead to trouble.

Plays from novels that held the stage for a time were *The White Sister*, which the late Marion Crawford made from his story of that name; *The Awakening of Helena Ritchie*, in which Miss Margaret Anglin did a great deal for Mrs. Deland's story, and *Septimus*, a dramatization of Mr. Locke's clever sketch of a modern Don Quixote. Other plays of 1909 which may be cited for purposes of record only were: E. C. Carpenter's *Barber of New Orleans*, produced by Mr. Faversham; Avery Hopwood's *This Woman and This Man*; Thompson Buchanan's *A Woman's Way*, to which Miss Grace George gave some charm; Lee W. Dodd's *The Return of Eve*; Clyde Fitch's insignificant farce, *The Bachelor*; J. Hartley Manners' adaptation from the German *The House Next Door*, a contrast of Christian and Jew to the latter's advantage; Sir Arthur Conan Doyle's *Fires of Fate*; Charles Klein's *Next of Kin*; Miss Mary Johnston's *Goddess of Reason*; Jerome K. Jerome's *New Lady Banstock*; Francis Wilson's *The Bachelor's Baby*; Roy Horniman's adaptation of W. J. Locke's *Idols*; Mr. Maugham's *The Noble Spaniard*; Leo Ditrichstein's *Is Matrimony a Failure?* and a roaring farce by Miss Mary R. Rinehart and Avery Hopwood called *Seven Days*, that achieved success out of proportion to its merits.

In England the important plays of the year were Pinero's *Mid-Channel*, a strong, if at times unpleasant, story of a woman who sacrifices everything to her husband's craving for worldly success; W. S. Maugham's *Smith*, a serious attack upon the vices of society; Rudolf Besier's *Olive Lattimer's Husband*; Ronald McDonald's melodramatic *The Chief of Staff*; R. C. Carton's farce comedy, *Mr. Ureedy and the Countess*; the same author's *Lorrimer Sabiston, Dramatist*; and Maeterlinck's fairy fanta-

FOUR NOTABLE PERSONS WHO DIED IN 1909

DRAMA

tasia, *The Blue Bird*.—Henry James's comedy, *The High Bid*, was tried and called by the critics a delightful talk in three acts. George Bernard Shaw found no particular enthusiasm awaiting his *Admirable Bashville*.

English men of letters have devoted much thought and work during the year to the scheme for a Shakespeare National Theatre. With the Lord Mayor of London in the chair, a meeting was held, at which the project took definite shape and preparations are under way for raising the money necessary for the building and endowment of an establishment that will be an honor to the British stage.

Le Scandale, by Henry Bataille, was perhaps the most important new play seen upon the Paris stage this last year. A fairly good woman, wife and mother, falls under the fascination of a blackguard, by whom she is dragged in the mire. It is a wonderfully clever study of the expiation paid by a woman for one moment of folly. Mme. Berthe Bady and M. Lucien Guiry played the leading parts with consummate skill. *Le Foyer*, of Octave Mirbeau; *Connais-toi de Paul Hervieu*; *La Furie* of Jules Bois; *La Route d'Emeraude*, by Richepin, and a romance of René Fauchois, with Beethoven as the chief figure, were some of the other French plays of more than momentary interest. *La Rampe (The Footlights)*, of Henri de Rothschild, was a curious study of the evil effect of stage life upon a woman's character. *Un Ange*, by Alfred Capus, depicted with unsparing realism the butterfly of Parisian life. Mme. Bernhardt lent her art to a portrayal of Jeanne d'Arc in a play by Emile Moreau. The distinguished French actress also appeared as the author of a drama, *Cœur d'Homme (Heart of Man)*, in which she elaborates the idea that man is by nature polygamous and that marriage often hinders rather than helps him. *Jarnac*, a romance dealing with the loves of Francis I., offered the Odéon Theatre an opportunity to give a capital picture of French manners under the gallant monarch. *Papillon*, by Louis Benière, was a clever study of French workmen and aristocrats brought in touch by means of a will that leaves to an old stonemason the fortune which the aristocrats think should belong to them. Paul Bourget, in *La Barricade*, shows this class strife from another angle of vision. In *La Maison de Danse*, Paul Reboux follows the picturesque fortunes of another Carmen.

Gerhart Hauptmann's *Griselda* was the noted production of the season in Germany. The distinguished poet makes the story of Patient Grisel the groundwork for a play of passion that failed to satisfy his admirers. Neither was *The German King*, a fervidly patriotic drama by the late von Wildenbruch, a success, notwithstanding all the efforts of Kaiser William, who staged this Hohenzollern eulogy with munificence.

In Italy d'Annunzio's *Fedra*, produced in Milan, disappointed his friends. The best Italian critics characterize it as a tiresome series of feeble monologues.

During 1909 the American stage lost by death Clyde Fitch, a playwright of indefatigable industry and unquestioned capacity for the presentation of commonplace types. Mme. Helena Modjeska, whose art in Shakespearean comedy will long be remembered with pleasure, also passed away during the year. In France the

death of both the Coquelins left a void hard to fill. Constant Coquelin was perhaps the most accomplished comedian of his time.

The American stage may also be said to have suffered in the retirement of William Winter after forty years of service as dramatic critic of the New York Tribune.

DREDGING. For the important harbor improvements in progress in ports of the world various types of dredging machinery were being used in 1909 and the years immediately preceding. On the Fraser River, British Columbia, there was used a Fruhling dredge, purchased in 1908, where a scraping device or combined with a suction pipe and valves enabled the amount of water mixed with the mud and sand to be controlled. This dredge traveled from Europe via the Suez Canal and Japan and reached Victoria March 2, 1909. Of suction or hydraulic dredges the United States government maintains a number on such important works as New York Harbor, the Passes of the Mississippi River, Galveston Harbor, and the Columbia and Willamette Rivers in Oregon. In 1909 there were 24 in use, ranging from the *Gedney*, built in 1887, to the *Navesink*, *Raritan*, *Clatsop*, and *Galveston*, built in 1908. The first two were employed on the Ambrose Channel of New York Harbor (see HARBOURS) and on steel vessels 290 feet in length, with two 20-inch pumps capable of dredging 10,000 cubic yards daily. The *Clatsop*, leaving Philadelphia December 9, 1908, made a voyage under her own power around Cape Horn to the Pacific coast, reaching Portland, Ore., on April 20, after a trip of 132 days, 54 of which were spent in ports, and on June 25, 1909, began dredging in the Columbia River. The *Clatsop* is a steel vessel 180 feet in length, with two 18-inch pumps and a daily dredging capacity of 1910 cubic yards. The *Galveston*, 304 feet in length, with two 20-inch pumps, was used during the year at Galveston Harbor, Texas. The huge dredge, *Leviathan*, of 8500 tons, which was constructed in 1908 for the Mersey Docks and Harbor Board of Liverpool, was in active use during 1909 and was one of a fleet of five at work on the Queen's and Crosby Channels from which in a year 12,500,000 tons of sand were removed. The *Leviathan*, which is a twin-screw, self-propelling, sand pump, hopper dredger, has a capacity of 10,000 tons or 180,000 cubic feet. Its machinery was stated to be equal to filling its hoppers with such a load of clean Mersey sand in fifty minutes, and in actual work during the year it removed 70,000 tons in a single day and 300,000 tons in a week. Such work by suction dredgers has resulted in deepening of the Queen's Channel from 25 to 27 feet at low water over a width of 800 feet.

During the year an unusually large elevator dredge was in operation in the entrance channel to Boston Harbor, taking the place of a dipper dredge previously used on this work, which involves excavation to a depth of 35 feet below low water level, or at high tide working in a depth of 50 feet of water. The depth and exposure to weather made it advantageous to employ an elevator dredge, a type that has been used but rarely in the United States for such work, but has been successfully employed in Europe. The machinery of the *Denver*, as this dredge was named, was installed in a vessel with heavy oak timbers 242 feet in length,

with a beam of 36 feet and a depth of 21½ feet, until his death. In 1886 he was president of the General Synod of the Reformed Church. He was a delegate at many important conferences and was Vedder lecturer at the New Brunswick Theological Seminary in 1883. Among his published works are: *Historical Sketch of the First Reformed Church of Ghent, N. Y.* (1876), and *Truths and Untruths of Evolution* (1884).

DRY DOCKS. The Pearl Harbor dry dock, seven miles west of Honolulu, Hawaii, for which a contract was awarded in 1909, promised to be the largest masonry dry dock in the world. Its plans called for a structure 1200 feet in length, or capable of taking the largest vessels, and at the same time it is to be divided in the centre by a gate, so as to handle two smaller ships simultaneously. It was determined to construct at the beginning only one-half, or a portion 589 feet in length from outer sill to coping, but with sufficient depth, 44 feet, and width at bottom 93 feet. The new dock was being excavated in a coral formation of irregular character, the total amount required being upwards of 200,000 cubic yards, exclusive of dredging. It will be built of concrete, and will require of this material 71,000 cubic yards. The amount available for the construction was \$2,000,000. The new dock will form the nucleus of an important United States naval station at Pearl Harbor, which is four miles from the sea and is reached by a channel dredged by the United States government at an expense of \$3,500,000. Work was begun during the year on the largest dry dock in the East at Singapore, at an estimated cost of \$2,000,000. It was to be 852 feet in length, 128 feet wide at the entrance, and have a depth of 34 feet over the sill. In addition to its commercial utility this new dock was expected to be of great assistance to the British fleets in Eastern waters. This dock is but a portion of extensive harbor improvements contemplated at this port, which involves also the reclamation of 80 acres of foreshore, the construction of a quay 6000 feet in length, and a wet basin of 25 acres. It was estimated that the entire project would cost about \$15,000,000 and would involve for its completion some nine years.

DRUM, RICHARD COULTON. An American army officer, died October 14, 1909. He was born in Greenborough, Pa., in 1825, and studied for a time in Jefferson College. At the outbreak of the Mexican War he was studying law, but he at once enlisted as a private in the Pennsylvania Volunteer Infantry. In April of the following year he joined the Ninth Infantry as a second-lieutenant and fought in many of the important engagements of the war. For bravery at Chapultepec he was brevetted first lieutenant. Following the war he served in the South and at Leavenworth, Kansas, and was made a first-lieutenant in 1850. He took part in many important campaigns against the Indians. In 1850 he became adjutant and artillery officer at the artillery school at Fort Monroe. He was appointed assistant adjutant-general and in 1861 was assigned to duty at San Francisco, where he rendered many useful services in connection with the Indians and the Mormons, who during the Civil War were troublesome. In 1865 he was brevetted brigadier-general and in 1869 was made a colonel. He served with General Meade and with General Hancock until 1873, when he was sent to Chicago as assistant adjutant-general of the Division of Missouri. He took vigorous measures to prevent mob violence during the threatened labor troubles of Chicago in 1877. In 1878 he was transferred to the adjutant-general's office in Washington and in 1880 was promoted to be adjutant-general, with the rank of brigadier-general. His proposal in 1887 to return captured battle-flags to the Southern States caused a considerable sensation. President Cleveland approved the proposition, but rescinded the order when protests from the Grand Army of the Republic and others showed strong sentiment against it. He was retired for age in 1889. General Drum was one of the founders of the Army Mutual Aid Association, and for more than twenty years its president.

DRURY, JOHN BENJAMIN. An American Dutch Reformed clergyman and editor, died March 21, 1909. He was born at Rhinebeck, N. Y., in 1838, and graduated from Rutgers College in 1858, and from the New Brunswick Theological Seminary in 1861. He held a pastorate at Ghent, N. Y., from 1864 to 1887. In the latter year he became editor of the *Christian Intelligencer*, in which position he remained

DUBUFE, EDOUARD MARIE GUILLAUME. A French artist, died May 27, 1909. He was born in Paris in 1853, and was the pupil of his father, Edouard Dubufe, and of Mazerolle. His most notable work was in large allegorical painting, but he was well known also as a painter of figures and portraits. Among his best known works are "Sacred and Profane Music" and "The Trinity of Poets." He decorated the ceiling of the foyer of the Comédie Française, and portions of the Hôtel de Ville and the Sorbonne. In 1889 he received a first class medal and in the same year was made a member of the Legion of Honor.

DUCEY, THOMAS JAMES. An American Roman Catholic clergyman, died August 22, 1909. He was born at Lismore, Ireland, in 1843. He came to the United States when but five years of age. He studied at the College of St. Francis Xavier, New York City, and the Theological Seminary at Troy, N. Y. He was ordained priest in 1868. After service at the Church of the Nativity and St. Michael's, he founded St. Leo's Church in New

York City in 1880, becoming its pastor. He was prominent in movements against municipal corruption and of philanthropic enterprises.

DUDLEY, WILLIAM WADE. An American soldier and public official, died December 15, 1909. He was born at Weathersfield, Vt., 1842. He served during the Civil War in the Nineteenth Indiana Volunteers. He was brevetted brigadier-general for distinguished services and was wounded at the battle of Gettysburg, losing his right leg. During the administration of President Arthur he was Commissioner of Pensions. In 1888 he became treasurer of the National Republican Committee and from 1889 to the time of his death he practiced law in Washington.

DUHAMEL, JOSEPH THOMAS. A Canadian Roman Catholic prelate, died June 5, 1909. He was born in Contrecoeur in 1841, and studied at Saint Joseph's College, Ottawa. In 1863 he was ordained priest and in 1874 became Bishop of Ottawa and was appointed Archbishop of Ottawa in 1886. Through his efforts the college at Ottawa was given the powers of a Catholic university.

DUNKERS or DUNKARDS. See BRETHREN, CHURCH OF THE.

DURAND, EDWARD DANA. An American economist, appointed in 1909 Director of the Census Bureau to succeed S. N. D. North. He was born at Romeo, Mich., in 1871, graduated from Oberlin College in 1893 and from 1895 to 1897 he was legislative librarian of the New York State Library. In 1898-9 he was assistant professor of administration and finance at Leland Stanford University. He was appointed Secretary of the United States Industrial Commission in 1900, serving until 1902. In the latter year he was appointed instructor in economics at Harvard University. He acted as special expert agent in the United States Census Office on street railways and electric light plants in 1902. From 1903 to 1907 he was special examiner in the Bureau of Corporations, and from 1907 to the time of his appointment as director of the census he was Deputy Commissioner of Corporations. He is the author of *Finances of New York City* (1898), and has contributed to economic and political subjects in various economic journals.

DURHAM, ISRAEL W. An American political leader, died June 28, 1909. He was born in Philadelphia in 1856, and was educated in the public schools. He learned the trade of brickmaking, but went into the flour business. In 1885 he was elected a police magistrate in Philadelphia, and was reelected in 1890. He was elected State Senator in 1897, and in 1900 was appointed State Insurance Commissioner. In 1908 he was again elected to the State Senate. Senator Durham was for many years the practical dictator of the municipal government of Philadelphia, and was one of the most powerful political "bosses" this country has ever known. His control of the machinery of government was so complete that until 1905 the efforts to break his influence were of almost no avail. His defeat came finally in the year mentioned. The United Gas Improvement Co. wished to have its lease renewed for 75 years for \$25,000,000. A deal was made between the company and Durham by which the ordinance providing for this was to be rushed through the Councils. Public in-

dignation was so aroused that Durham was thoroughly frightened, and the proposed lease was withdrawn. At the same time Durham announced his withdrawal from politics, and he remained in retirement until 1908, when he was elected to the State Senate, as noted above.

DUTCH EAST INDIES. The colonial possessions of the Netherlands, lying between the Asiatic continent and Australia.

AREA AND POPULATION. The area (in square miles) and population (1905) are reported as follows:

	Area	Pop., 1905
Java and Madura	50,775	30,098,008
Island of Sumatra:		
Sumatra, West Coast	31,788	1,308,471
Sumatra, East Coast	35,480	568,417
Bengkulu	15,556	413,301
Tapanoel	16,251	204,269
Lampung	11,338	166,518
Palembang	53,716	796,354
Atjeh (Achin)	20,549	582,175
Riau Lingga Archipelago	16,378	112,216
Banca	4,473	115,189
Billiton	1,870	36,858
Borneo, West Coast	56,060	450,929
Borneo, South and East Dists.	157,585	782,726
Island of Celebes:		
Celebes	49,405	1,397,200
Menado	22,176	436,406
Moluucca Islands	44,038	407,419
Timor Archipelago	17,782	308,600
Ball and Lombok	4,063	523,535
New Guinea to 141° E. Long.	152,428	240,000
Total	748,340	38,938,000
Total, 1900		37,734,000

The foregoing population figures for the most part are necessarily approximations, and the population of several unexplored regions is not included; the figures for Java and Madura, however, may be regarded as accurate. In 1905 Eurasians and persons of pure European blood numbered 80,910, mostly Dutch and mostly born in the East Indies; Chinese, 563,000; Arabs, 20,000; and other foreign Orientals, 23,000. The principal cities, with their populations in 1905, are: In Java, Batavia, the capital, 138,551; Surabaya, 150,198; Samarang, 96,600; in Sumatra, Palembang, 60,985; in Borneo, Banjarmassin, 16,708; in Celebes, Macassar, 26,145. The Dutch maintain religious liberty. In 1905 there were among the natives and other Orientals about 460,000 Christians. Missionaries (1906) numbered 205. For the education of Europeans and Eurasians, besides private schools, there are public elementary and middle-class schools, with upwards of 22,000 pupils. Government schools for natives are attended by about 135,000 pupils, and private schools by upwards of 100,500. Schools for foreign Orientals have over 12,000 pupils.

PRODUCTION, COMMERCE, ETC. The principal products are sugar, coffee, cinchona, tobacco, tea, indigo, tin, coal, salt, gums, bark, and spices. The total imports and exports in 1906 were valued at 234,888,000 guilders and 330,930,000 guilders respectively; in 1907, 247,270,000 and 364,550,000 respectively. Included in the foregoing figures are government imports and exports valued at 11,061,000 and 16,250,000 guilders respectively in 1906, and 14,625,000 and 17,008,000 respectively in 1907. The principal exports of merchandise were valued in 1907 as follows: Sugar, 100,142,000

guilders; tobacco, 55,451,000; copra, 25,132,000; petroleum, 21,844,000; gums, 19,248,000; tin, 17,320,000; coffee, 14,825,000; gutta-percha, 12,619,000; tea, 8,230,000; pepper, 7,211,000; rattan, 6,560,000; cinchona, 6,502,000; rice, 5,256,000; hides and skins, 4,299,000; nutmegs, 3,181,000. About three-fourths of the exports go to the Netherlands. In 1907 the total mileage of the railways reported was 3157, of which 2595 miles were in Java and 562 miles in Sumatra; telegraph lines, 8882 miles, with 12,025 miles of wire and 569 offices; post-offices, 1620.

GOVERNMENT, FINANCE, ETC. For administrative purposes the Dutch East Indies are divided into two parts, the one comprising Java (with Madura), where the Dutch control is complete, and the other, the remaining islands, or "Outposts," in some of which Dutch authority is merely nominal. There is a governor-general (J. B. von Heutz since 1904) for the whole colony, in whom is vested both executive and legislative power, subject to the approval of the home government. He is nominated by the sovereign and is assisted by a council of five members. The colony is divided into Residencies (Java and Madura) or districts, administered by either Dutch officials or native chiefs. The Residents and other Dutch officials govern not so much directly as through native functionaries.

There is a colonial army (separate from the home army), which on January 1, 1909, numbered 35,208 officers and men, of whom 10,785 were Europeans, recruited by volunteers from the home forces. In 1909 that part of the Dutch navy stationed in East Indian waters numbered 17 effective vessels, aggregating 23,159 tons.

Revenue is derived chiefly from taxes, monopolies (opium and salt), and the sale of products of government lands and mines. Of the expenditure, about one-fourth is for general administration, and another fourth for the army and navy. Revenue and expenditure in 1908 amounted to 175,142,396 guilders and 181,746,012 guilders respectively. For 1909 estimated revenue was 181,540,117 guilders and estimated expenditure 193,938,592 guilders.

In the summer a violent earthquake occurred in Upper Padang, resulting in a loss of life reported at 200.

DUTCHER, SILAS BELDEN. An American capitalist died February 10, 1909. He was born in Springfield, N. Y., in 1829, and was educated in the public schools and in Cazenovia Seminary. He taught school from 1845 to 1851, was engaged in railroad work from 1851 to 1855, and from the latter date to 1868 was in mercantile business in New York City. He soon entered politics, and in 1860 was chosen Supervisor of the city and county of New York. He resigned from this office and removed to Brooklyn, where he became one of the leading figures in local politics. He served as chairman of the Republican County Committee for four years (1869-1873), and during that time he, with General B. F. Tracy and General James Jourdain, practically ruled the city. In 1872 he was appointed pension agent for the eastern district of New York, and in 1877 he was made Appraiser of the Port. In 1880 he resigned to become State Superintendent of Public Works. Mr. Dutcher was an important figure in the political, financial, and

philanthropic movements of New York. He was a member of the Charter Commission for the Greater City, and was a director and trustee in many important financial institutions and was largely interested in many philanthropies.

DUTCH GUIANA, or SURINAM. A colony of the Netherlands on the north coast of South America. Area, about 49,845 square miles (some authorities give 46,000). The population is estimated at 84,113. Capital, Paramaribo, with 34,870 inhabitants. There were in 1906 22 public schools, with 2487 pupils, and 36 private schools, with 5285. There are also denominational schools. At the end of 1906 the population was divided according to religions as follows: Moravian Brethren, 27,159; Roman Catholics, 15,529; Hindus, 12,487; Reformed and Lutheran, 9527; Mohammedans, 8418; Jews, 1049. In 1906 the sugar produced amounted to 12,635,400 kilos; cacao, 1,310,914; rice, 1,496,163; corn, 898,127; coffee, 218,000; rum, 818,585 litres, and molasses, 1,896,519 litres. Gold is mined. The imports and exports for 1907 amounted to 6,903,000 and 5,838,000 guilders (1 guilder = 40.2 cents) respectively. The export of gold in 1906 was valued at 1,611,966 guilders. The colony had about 29 miles of railway in 1907. Shipping in 1907, 211 vessels of 283,000 tons. The revenue and expenditure in 1908 were 3,547,000 and 4,402,000 guilders respectively, against 3,496,000 and 4,373,000 in 1907; subvention (1908), 855,000, against 879,000 in 1907. Estimated revenue and expenditure for 1909, 3,957,350 and 4,775,854 guilders; subvention, 809,302. The colony is administered by a governor, assisted by an executive council appointed by the Queen. The legislative body—the Colonial States—is mainly representative. The Governor is R. D. Fock.

DYNAMO ELECTRIC MACHINERY. The developments in dynamo electric machinery for 1907 and 1908 were largely confined to changes in large turbine-driven alternators, the improved design of alternating-current railway motors, the introduction of silicon steel, and the application of storage batteries to alternating-current circuits by means of a variable ratio converter. During 1909 the use of turbine-driven alternators has been greatly extended and the available capacities have reached the remarkable value of 20,000 kilowatts. No great advances have been made in the economy of such units and their hold on the central station field is rather to be attributed to their convenience and their excellent adaptation to operation in parallel on complicated systems. Combinations of reciprocating engine units and low pressure turbine units have fully justified the claims of their promoters as a means of greatly increasing the output and efficiency of existing stations. Much progress has been made in the design of producer gas units capable of employing the cheapest grades of fuel. Units of this type have proven a great aid to economy in small stations. European engineers have introduced alternators operated at 30,000 volts, but American designers have preferred to remain within the former limits of 15,000 volts in order to insure reliability.

A promising type of variable speed induction motor has been brought out during the year. It has a stator and squirrel cage rotor of the usual forms separated by a greatly enlarged air gap. This gap is occupied by a "spinner" of cylindrical form, built up of steel laminations. Its outer surface bears a squirrel cage winding, which serves as a secondary to the three-phase stator windings. On its inner surface is a three-phase coil winding, which serves as a primary to the squirrel cage of the main rotor. With the spinner held stationary the stator is on open circuit and the rotor is driven by the inner winding of the spinner. When the stator is excited the spinner revolves and exercises either a cumulative or differential control over the speed of the rotor. By a proper choice of the number of poles on the stator and the inner winding of the spinner the motor is given three inherent speeds, with intermediate steps obtained by resistance control.

The construction and successful use of small alternators giving a frequency of 100,000 cycles per second was a mechanical and electrical achievement of exceptional order. The greater part of the progress of 1909 is found in the higher refinements of the commoner types of apparatus. For example, the commutator troubles, which had hitherto been the bugbear of railway motor operation, have been practically eliminated and satisfactory motor performance is now largely a matter of heat dissipation.

In the realm of hydro-electric generators the year was especially noteworthy for the attention given to the equipment of low-head sites. Units of 4000 kilowatts are now available for heads as low as 7 feet.

DYSENTERY. See TROPICAL MEDICINE.

EARTHQUAKES. The record for 1909 showed about the average number of earthquakes throughout the world, but fortunately none to rival the disastrous occurrences of the few preceding years. The Messina earthquake of December 28, 1908, continued to share general attention as the full details were gradually revealed in authoritative accounts. These substantiated in the main the early estimates of damage and loss of life, and there is no doubt that it marked the culmination of recent, if not all historical, catastrophes attributable to natural forces. Of special interest to students of seismology was the completion of the final report of the California Earthquake Commission, the first volume of which was brought out recently by the Carnegie Institution. Few earthquakes have afforded such opportunity for investigation since the development of more exact methods of observation, and the report should prove of great value from a practical as well as from a scientific standpoint.

The following list includes the principal disturbances during the year: *January 23.* A destructive earthquake in Central Asia; felt in Chinese Turkestan, but probably centred in the province of Luristan, Persia, where 60 villages were reported to have been destroyed, with from 5000 to 8000 deaths; the earth tremors were registered all over the globe. *February 17.* A slight shock reported throughout Porto Rico; small property loss. *May 17.* Reported shakings in provinces of Tacna and

Arica, Chile, on this and previous days. *June 8.* A heavier earthquake in the same region as the last, partially destroyed the city of Copiapo. *July 8.* Severe shock experienced in Turkestan and northern India; principal damage at Kerki, Kurgan and Chitral. *September 22.* Slight earthquake in Calabria and Sicily, sufficient to overturn some of the ruins left by the Messina disturbance of 1908. *October 20.* American and European seismological stations reported a strong earthquake, which was not traceable to any known source on land and was probably of submarine origin; the approximate locus seemed to have been off the West Indies; additional shocks from the same region apparently were registered at intervals for the next two months.

SEISMOLOGY. In an investigation of the Messina earthquake made under the auspices of the Italian Geographical Society, Dr. Mario Baratto found that the chief causes for its disastrous results were the damaged condition of the buildings due to preceding shocks, the nature of the foundations, and the wretched materials used in the structures, which were designed, moreover, after plans least adapted to seismic conditions. As has always been the case, the buildings that rested upon sand and loose rocks experienced the greatest damage. The actual loss of life at Messina and Reggio is still unknown, but outside of these cities the maximum mortality was at Cannitello, where the rate was 43.7 per cent. Elsewhere the rate ranged from less than 10 to 30 per cent. In the matter of intensity the shock was far inferior to the Calabrian earthquake of 1783.

The possibility of forecasting the occurrence of earthquakes was discussed in an illuminating paper by G. K. Gilbert, a member of the commission that investigated the California earthquake. Classifying the factors to be considered under the general categories of time and place, Professor Gilbert states that present means suffice to delimit with approximate accuracy the regions which are liable to heavy destructive shocks (malloisms). This class of disturbances is a concomitant of tectonic or mountain-making changes, the effects of which are exhibited superficially in the fracture or faulting of rocks. Aside from the information derived from human experience, there are several criteria applicable to the recognition of such regions. The existence of high mountains is *per se* evidence of seismic activity, since lofty mountains must be considered relatively youthful features (or they would have been planed down by erosion), and under the principle of continuity young mountains of uplift are presumably in a state of growth. A conspicuous example in support of this generalization is the Mount St. Elias group, which rises 20,000 feet from its base, and has been shown by Russell to have added to its height in recent geological times; the group has been the scene of repeated violent disturbances within the historical period. The presence of fault scraps along the bases of block mountains, so recent in origin that they have not been obliterated by erosion, is equally suggestive of activity. Again a rift topography like that in California, which was brought into prominence by the recent disturbance, affords evidence of the occurrence of earthquakes. With these aids and with the benefit of records

extending over a considerable period of time the recognition of maloseismic regions offers no insuperable difficulties. On the other hand, the relation of earthquake danger to time is much less definite, and there is less promise of future accomplishment in that field. The various hypotheses of rhythmic occurrence, alternation between different parts of a region, and precipitating factors have not been sufficiently tested, however, to permit final judgment of their value. On the whole it is more important to know the places of danger than the times, since if the former are recognized the adoption of precautions in building and construction will insure, not only the diminution of financial loss, but also of life.

A constant feature of earthquake records made by seismographs is the division of the tracing into distinct parts, which have come to be known as the first preliminaries, second preliminaries and main phases. This differentiation is explained by Montessus de Borel as due to the varied character of the vibrations that are set up by the disturbance. The first preliminaries, which travel at a maximum speed, are probably propagated as longitudinal waves, the second preliminaries as transverse waves, while the main phase consists of a multiple wave motion that represents the destructive shock.

EAST AFRICA, GERMAN. See GERMAN EAST AFRICA.

ECLIPSE. See ASTRONOMY.

ECONOMIC ASSOCIATION, AMERICAN. A learned society, founded in 1885 for the encouragement of economic studies and the publication of papers thereon. The Association holds annual meetings in the latter part of December in different cities in the United States. The meeting in 1909 was of particular importance and interest, as it celebrated the twenty-fifth anniversary of the Society's founding. It was held in conjunction with the American Historical Association and several other societies in New York City from December 27-31. Many men of high public position were present, including Governor Hughes, Mayor McClellan, Hon. Joseph Choate, the President and Board of Trustees of Columbia University, and others. Among the foreign economists and representatives of learned societies were Hon. James Bryce, Ambassador from Great Britain; Mr. Henry Higgs, representing the Royal Economic Society of London; Professor James Mavor, of the University of Toronto, and Mr. James Bonar, Deputy Master of the Canadian Branch of the Royal Mint. Among the important addresses and papers read were the following: "Historical Account of the Founding of the Association," Professor Richard T. Ely, of the University of Wisconsin; "The Work of the American Economic Association," by Professor Hadley, of Yale University, and others; "Dynamic Economics," by Signore Pantaleoni, of Italy; "Theory of Wages," by Professor F. W. Taussig, of Harvard University; "The Valuation of Public Service Corporations," by Henry C. Adams, of the University of Michigan; "A Discussion of Trusts," by Francis Walker, of Washington, D. C., Victor Morawetz, of New York City, Professor J. W.

Jenks, of Cornell University, and others; "A Discussion of the Subject of Taxation," by Professor E. R. A. Seligman, of Columbia University, Henry Higgs, of London, and Lawson Purdy, of New York City. The attendance at this meeting was the largest in the history of the Association. By reason of the unusual increase in membership in the preceding year over 400 new members were added. By a distinct change of publication policy voted at the meeting of 1909 it was decided to establish not later than January 1, 1911, a new economic journal in place of the two sets of publications issued by the Association and to call this new journal *The American Economical Review*, to be in charge of an editor elected by the Association, and six associate editors. New enthusiasm was shown by all the members present for the Association and its work. The officers elected to serve for the year 1910 were as follows: President, Edmund J. James, of the University of Illinois; Vice-Presidents, Frank L. McVey, University of North Dakota; Herbert J. Davenport, University of Missouri; Alvin S. Johnson, University of Texas; Secretary, T. N. Carver, Harvard University.

ECONOMIC ENTOMOLOGY. See ENTOMOLOGY.

ECONOMIC GEOLOGY. See GEOLOGY.

ECUADOR. A South American republic on the Pacific coast between Colombia and Peru. The capital is Quito.

AREA AND POPULATION. The 16 provinces and one territory (the Galapagos Islands, area, 2400 square miles, population 400), have an estimated area of 118,627 square miles; estimated population, 1,272,000 or, including uncivilized Indians, 1,400,000. The greater part of the population is Indian; mestizos number about 400,000, and persons of unmixed white descent are few. The principal towns, with population, are: Quito, 50,841 (1906); Guayaquil, 51,000; Cuenca, 30,000; Riobamba, 18,000. In 1909 Quito was reported to have about 75,000 inhabitants, and Guayaquil between 75,000 and 80,000. Primary instruction is free and compulsory. Public primary schools number about 1100. There are some provisions for secondary, higher, and technical education. The Roman Catholic is the established church of the state.

INDUSTRIES. Agriculture is the principal industry, and cacao the staple product. The cacao plantations are upwards of 5000 in number, with some 61,000,000 trees. The crop in 1907 amounted to 19,670,000 kilos; in 1908, 31,900,000 kilos; in 1909 (estimated), 29,000,000 kilos. Rice is produced annually to the amount of about 40,000,000 pounds, which is not quite enough to supply the home demand. The estimated annual production of coffee is about 7,000,000 pounds; sugar, 16,000,000 pounds; vegetable ivory nuts, 48,000,000 pounds; rubber, over 1,000,000 pounds. Various metals and minerals occur, including gold, silver, copper, iron, lead, coal, and sulphur, but mining has not attained any great importance. The leading manufacturing industry is the plaiting of Panama hats. There are a number of foundries, sugar refineries, flour mills, and ice plants, and establishments for the manufacture of various articles of common use, as matches, liquors, leather goods, soap, cotton and woolen blankets, and bags. These factories are mainly in Guayaquil and Quito.

FOREIGN COMMERCE. Imports and exports have been valued in sueres as follows:

	1906	1907	1908
Imports.....	17,011,605	19,699,673	20,554,731
Exports.....	21,964,714	22,906,964	26,559,207

The principal imports are textiles, food-stuffs, iron manufactures, clothing and wines and liquors. The leading exports in 1908 were: Cacao, 70,682,042 pounds, valued at 20,877,000 sueres (over one-half to France); vegetable ivory, 1,600,000 sueres; Panama hats, 1,599,000 sueres; rubber, 1,207,000 sueres; coffee, 1,136,000 sueres; hides and skins, 388,000 sueres. Imports from and exports to the countries commercially most important were valued as follows: Great Britain, 7,204,000 sueres and 3,523,000 sueres respectively; Germany, 4,298,000 and 1,984,000; United States, 4,097,000 and 7,743,000; France, 1,477,000 and 10,105,000.

COMMUNICATIONS. In 1908 there were 325 miles of railway and 2570 miles of telegraph line. The first train from Guayaquil over the newly completed road to Quito (286 miles) reached the capital June 25, 1908. On the 6th of the following August, work was begun on the line from Huigra to Cuenca (about 92 miles), to be completed within 28 months. This road will pass through the rich coal and agricultural district of southern Ecuador, connecting it with Guayaquil and Quito. A railway is projected from Bahia de Caraquez, a port about 100 miles north of Guayaquil, to Quito; one from Vargas Torre to Ibarra (about 125 miles); one from Manta to Santa Ana; and another from Ambato to the Arajuno River. As projected, the last three lines mentioned are to use electric motive power and be open to traffic in 1914. There is considerable river navigation. During 1907 entries at the port of Guayaquil aggregated 202 steamers and 8 sailing vessels, with a registry of 422,344 tons; more than half were British, 57 Chilean, 37 German, and only one American. In 1908 184 vessels of 390,333 tons entered, and 185 of 390,336 tons, cleared.

FINANCE. The unit of value is the sucre, worth 48.665 cents. Revenue and expenditure in sueres are reported as follows:

	1906	1907	1908
Revenue.....	12,188,000	12,724,567	12,575,700
Expenditure...	13,237,180	15,401,785	12,674,590

About 70 per cent. of the revenue is derived from import and export duties. The estimated expenditure for 1908 was 2,077,590 sueres less than the figure given above; the larger items of the estimate were: War and marine, 2,260,000 sueres; debt, 1,950,000; public instruction, 1,120,000; public works, 1,000,000. The outstanding foreign debt in December, 1908, is reported at 10,808,000 sueres; internal debt, October, 1908, 8,386,135 sueres.

NAVY. There are one torpedo launch, one transport, and one lighter, with about 180 men.

ARMY. The estimated strength of the active army is 4350 officers and men, to which may be added a National Guard of about 90,000. The laws providing for compulsory service are not rigidly enforced.

GOVERNMENT, ETC. The executive authority

is vested in a president, who is elected for a term of four years and is assisted by a cabinet of five members. The legislative power devolves upon a congress of two houses, the Senate and the House of Representatives. The President in 1909 was General Eloy Alfaro, who was inaugurated January 1, 1907. The provinces are administered by governors appointed by the President.

In 1909 a serious railway accident occurred on February 24, near Riobamba, where a train left the track and was thrown over a cliff, killing twenty and injuring forty others.

ECUADORIAN EXPOSITION, NATIONAL See EXPOSITIONS.

EDDY, WILLIAM ABNER. An American meteorologist, died December 26, 1909. He was born in New York, in 1858, and spent his boyhood in Belvedere, Ill. He took a preparatory course in Chicago University. In early life he engaged in business as an accountant and in 1890 he began experiments in kite-flying. He was especially interested in the currents and layers of air which are constantly shifting about, and in endeavoring to arrive at some method for using them to advantage. He sent up many kites in various parts of the country of his own design and arrangement in carrying out his experiments. In the summer of 1896 he conceived the idea of sending up kites with a camera attached and taking pictures from a great height. In 1903 he made a miniature aeroplane, modeled after the plan of Alexander Graham Bell's, and by means of a cord treated with a solution of saltpetre he bound the model to an immense kite. Before sending up the kite he set fire to the cord, which burned slowly and released the aeroplane at a considerable height. He arrived at the conclusion that an added weight and a reliable motor was all that was needed to prove to the world the possibility of the aeroplane as a means of traveling. Mr. Eddy sent some of his kites to a height of nearly 7000 feet. He made a record of the temperature marked on his thermometers at different heights and asserted that these temperatures foretold what changes of temperature might be expected within the next twelve hours on the earth below. He was interested in the problem of flotation in the air and made many experiments in that direction. He constructed also various devices to measure the tremors of the earth. These consisted of tops suspended from the ceiling on strings and spinning on plates of smoked glass. Any trembling of the string was recorded by the tops on the glass.

EDUCATIONAL ASSOCIATION, NATIONAL See EDUCATION IN THE UNITED STATES.

EDUCATION IN THE UNITED STATES. The United States Commissioner of Education reported in 1909 that 16,890,818 pupils were enrolled in the public schools in 1908. They were accommodated in 259,355 schoolhouses, valued at \$858,655,200, and instructed by 104,414 men and 376,902 women teachers who received \$202,047,814 in salaries. Other expenses brought the total expenditure up to \$336,898,333, an average of \$28.25 per pupil or \$3.90 per capita of the entire population. The equipment is improving and the number and the salaries of teachers are more than keeping pace with the growth of the country. But so long as one-fourth of the States spend less than \$15 per pupil and one-fourth spend more than \$35 there is opportunity for further development. The

variation between the lowest expenditure, \$6.37, and the highest \$72.15, is obviously too large. The reports of the new Commissioner of Education have been widely appreciated for their prompt appearance, the condensation and interpretation of their statistics, and their timely discussion of significant topics. The practically unanimous demand of educators has not, however, yet moved Congress to make possible a large extension of the Bureau's work. Instead of the requested doubling of its income of \$67,500, an increase of only \$4700 was granted for 1909-10.

The forty-seventh annual convention of the National Education Association, meeting in Denver in July, declared its belief in: (1) education as the chief foundation of democracy, (2) the development of commercial and industrial training, along with (3) cultural opportunities for all, (4) the improvement of supervision and teaching and the exclusion of secret organizations from schools, (5) the importance of training for citizenship, (6) of the work of the American School Peace League, of (7) more systematic attention to physical education, (8) better training, longer tenure and more nearly commensurate compensation for teachers, (9) the use of school equipment for community interests, and (10) the consolidation of rural schools. The twelfth annual conference for education in the South, meeting in Atlanta in April, found that high schools in the region were increasing at the rate of 100 a year and State and local appropriations at the rate of more than two million dollars annually, and adopted resolutions favoring the improvement of county supervision, the better training of teachers, and increased appropriations for the National Bureau of Education. Especial attention was given to the problem of rural education and to the measures for its improvement which have already been undertaken by 26 States,—consolidation of schools, text-book commissions, better distribution of appropriations, better supervision, free transportation of pupils, and compulsory conventions of teachers. Two-thirds of the population are affected by these measures.

Vocational and civic training also were centres of much attention during the year. The general withdrawal of pupils from school immediately after the age for compulsory attendance, the rapid development of private technical institutions, the efforts of the National Society for the Promotion of Industrial Education,—which held its third convention at Milwaukee in December—and their endorsement by the National Association of Manufacturers and, most cordially, by the American Federation of Labor—these were items of public opinion that appeared to demand immediate recognition. The investigations of the Massachusetts Industrial Commission, created in 1905, resulted in the collection and dissemination of important information upon the subject and the reorganization of the Massachusetts Board of Education under a commissioner favorable to industrial education. The New York State Department of Education outlined a simplified curriculum for the elementary school to be followed by commercial and industrial as well as academic high schools. Similar changes were approximated elsewhere. It may be said, therefore, that in 1909 the desirability of vocational education in the public schools became generally acknowledged and its practical realization was undertaken,—one of the most far-reaching departures in the history of

American education. Similarly, the necessity for civic training was more widely discussed than ever before and more attention was directed to practical agencies for its attainment, such as the George Junior Republics, the "school cities" inaugurated in New York in 1897, and the "Rochester" or school civic club movement.

The fields of health, hygiene and physical education showed steady development. In forty-three cities school nurses give hygienic instruction in homes, in fifty-six nurses take children to dispensaries or instruct parents at the schools, ninety-eight distribute cards of hygienic instruction, 117 attend to dental and 170 to breathing defects. Most of these results have been attained in the last five years, many of them through volunteer organizations. Few such benefits are as yet available for pupils outside of cities. The Massachusetts State Board of Education and the New York City Bureau of Municipal Research have issued publications concerning the physical welfare of school children. Chicago, Boston and New York have had interesting results with open-air classes or with classes in rooms with wide-open windows. The temperature of all Chicago school rooms has been lowered and they are to be aired thoroughly several times a day. The United States Bureau of Education has issued a bulletin concerning the feeding of school children,—its ideal composition and service, the problems to be overcome, organizations which are working in the field, and systems and schools where progress has been made. The American School Hygiene Association and similar bodies continued to urge the general hygienic aspects of physical instruction and of athletics. Washington, New York, Boston and New Haven prohibited football in the schools. Boston required all high school pupils to learn to swim. New York placed physical training on a parallel with other branches in grading for promotion and graduation. The National Playground Association at its third annual congress, held in Pittsburgh in May, reported the establishment of playgrounds in more than 350 cities, and the support of the movement by municipalities, associations, institutions and settlements. A corresponding development in athletics, folk dances, festivals and pageants was also reported—happy educational profiting from the pleasure of fulfilling national dramatic and play instincts.

Although college authorities found fortunate results in a similar coöperation with student secret societies, these were made a cause for expulsion or suspension from the schools of Chicago and Denver. California passed a law against such school organizations, but the Attorney-General of Michigan reinstated a pupil who had been expelled under a similar law. No other large question of discipline arose and none of morals. An American committee, appointed by the International Moral Education Conference which met in London in 1907, is at work upon a plan for moral education in the schools. Meanwhile the University of Wisconsin has published a plan successfully carried out in schools in that State and the superintendent of schools of Philadelphia is testing in that city a plan of the National Character Development League, of which he is president. A new law requires Illinois teachers to give weekly instruction in the humane treatment of animals. There are now 4703 Roman Catholic parochial schools with 1,197,913 pupils, both numbers representing a steady increase. Roman Catholics

in Kansas opposed the furnishing of free textbooks in the public schools. Hebrews in Chicago requested the school board to exclude from the schools certain hymns as hostile to their faith. The Religious Education Association at its sixth general convention in Chicago in February, reported encouraging progress in its propaganda for the closer co-operation of religious and educational forces, and the National Vacation Bible School Committee provided daily summer religious education in various cities.

Public and private high schools continued to develop toward a more harmonious relation with the colleges. In the field of mathematics an American branch of an International Commission on the Teaching of Mathematics is investigating the state and the tendency of such teaching in order to report recommendations for improvement to the International Congress of Mathematicians in Cambridge, England, in 1912. The American Federation of Teachers of the Mathematical and the Natural Sciences carried on investigations indicating that the teaching of physics might profitably use more practical applications and greater correlations with pupils' every day experiences, and that the teaching of biology might lead to a better understanding of the organic factors in environment and of personal and public hygiene. Public discussion of the conservation of natural resources and of vocational education has added a new industrial and commercial attitude to the teaching of geography, and economic views similarly modified the teaching of history. Dissatisfaction with the confusion of aims and methods in the teaching of English increased toward a promise of improvement. Some of the newer and more practical methods of teaching modern languages began to be adopted in teaching Latin and Greek. The acceptance of music as a field for school instruction continued to increase. The Bureau of Education reported that the fields of fine arts and art handicraft now controlled an annual expenditure of \$11,565,000, through public, private, evening, and summer schools, lectures, libraries and exhibits. Twelve States require drawing in the schools and thirty-one others encourage it.

The peculiar needs of children of recent immigrants received increasing attention. In New York City 76 per cent. of the school children have one foreign-born parent, 68 per cent. both parents foreign, 48 per cent. both parents non-English speaking, and 37 per cent. of the children are themselves foreign-born. Encouraging results have been attained by the labor camp schools of the Society for Italian Immigrants, the Baron de Hirsch English Schools for Immigrant Children, the French-American College in Massachusetts, and the Chinese Educational Commission's Schools in California. Negro education continued to depend chiefly upon private benevolence, as represented by the Southern Education Board, the Peabody, Slater and Jeanes endowments, and by special gifts. A speaking tour by Dr. Booker Washington, through Tennessee, South Carolina and Mississippi, and a number of reports before the Conference for Education in the South indicated, however, the beginning of more generous public appropriations. The Russell Sage Foundation's study of backward children found 15 per cent. of the children in the schools of 55 cities spending more than a year in the same grade. The sixth annual Conference on the Education of Backward, Truant, and Delinquent Children, meet-

ing in Buffalo in June, reported special classes for such children in many cities. Special schools for crippled and sick children were also reported. There was a growing movement to bring blind children into closer association in the schools with seeing children. The desire for vacation schools and night schools and for various forms of free education for adults continued to increase; and libraries and museums continued to seek closer and more fruitful relations with the schools.

The need for better salaries for teachers was kept to the fore, most conspicuously by the re-passage by the New York Legislature of a bill, vetoed in 1907, for equal pay for men and women in the schools of New York City. In vetoing the new bill, the Mayor appointed a commission to inquire into the relative cost of living of men and women teachers, and into the salaries of teachers in various cities. A preliminary report, late in December, held that to raise the salaries of women to equal those of men would increase the stipend of the minority of women who now receive the highest pay without aiding the majority who receive the lowest; to similarly raise the salaries of all women would cost \$11,000,000 a year; to reduce the salaries of the men would cause them to leave the schools. The commission suggested, therefore, a moderate increase for all women teachers, or a substantial increase for those in the lower grades, without reference to the salaries of men. New York and Boston continued their opposition to married women as teachers.

Chicago in July elected as superintendent of its schools, Mrs. Ella Flagg Young, a graduate of Chicago schools, a teacher for forty-seven years, a district superintendent from 1888 to 1899, professor of education in the University of Chicago from 1899 to 1905, and principal of the Chicago Normal School since that time. Two noted educators died during the year: Dr. William T. Harris, formerly United States Commissioner of Education, and Dr. Sheldon Jackson, Commissioner of Education for Alaska.

Among the educational publications of the year the following were prominent: *American Education* by Andrew S. Draper; *Impressions of American Education in 1908*, by Sara E. Burstell; *The American High School*, by John Franklin Brown; *Standards in Education, Including Industrial Training*, by Arthur Henry Chamberlain; *The Nature-Study Idea* (third edition), by Liberty H. Bailey; *American Playgrounds*, edited by Everett B. Mero; *Athletic Games in the Education of Women*, by Gertrude Dudley and Francis A. Kellor; *Psychology and the Teacher*, by Hugo Minsterberg; *How to Study*, by Frank M. McMurry, and *Social Development and Education*, by M. V. O'Shea.

EDWARDS, WILLIAM HENRY. An American naturalist, died April 3, 1909. He was born in Hunter, N. Y., in 1822, graduated in 1842 from Williams College, and was admitted to the bar in New York City in 1847. He had become fascinated by the study of butterflies, and in 1846 made a trip up the Amazon, chiefly studying butterflies. He published in 1879, 1884 and 1897 three series on the *Butterflies of North America*, which were so costly as to be available almost exclusively in reference libraries. He contributed many entomological papers to scientific journals. He wrote, in 1900, *Shakesper, not Shakespeare*. A genealogy of the Edwards family was completed by him in 1903.

EGYPT. A country of northeastern Africa

nominally under the suzerainty of Turkey, but practically under the protection of Great Britain. The capital is Cairo.

AREA AND POPULATION. The total area, excluding the Egyptian Sudan, is about 400,000 square miles; but the settled and cultivated area (that is, the Nile Valley and Delta) covers only 12,976 square miles. The population, according to the census of June 1, 1907, was 11,189,978 (exclusive of the Bedouin nomadic population estimated to number 97,381), as compared with 9,734,405 in 1897. By nationality the population in 1907 was made up as follows: Egyptians, 10,903,677 (sedentary, 10,366,048; nomadic, 537,631); foreigners, 286,301, including: Turks, 69,725; Greeks, 62,073; Italians, 34,926; British, including Maltese, 20,853; French, including Tunisians, 14,591; Austrians and Hungarians, 7704; Russians, 2410; Germans, 1847; other Europeans, 2116; Persians, 1385; Sudanese, 65,162; others, 2809. Of Egyptians over ten years of age, 62.65 per cent. were employed in agriculture; of the foreign population, less than one per cent. Of the Egyptians, 16.27 per cent. were employed in various industries and trades. Of the foreigners 47.85 per cent. Forty-eight per cent. of the total number employed in the liberal professions were foreigners. The principal cities, with population in 1907, are: Cairo, 654,476; Alexandria, 332,246; Tantah, 54,437; Port Said, 49,884; Mansurah, 40,279; Assiut, 39,442; Fayum, 37,320; Zagazig, 34,999; Damietta, 29,354; Kena, 20,069.

EDUCATION AND RELIGION. In 1897, of the sedentary Egyptian population over seven years of age, only 5.8 per cent. could read and write. In 1907 the number of kuttabs (native rudimentary schools) under government inspection was 4181, with 164,506 pupils, of which 2761 received grants-in-aid aggregating £17,402. The various schools under the immediate direction of the government in 1907 were: Kuttabs, 143, with 10,561 pupils; primary schools, 34, with 8556 pupils; secondary schools, 4, with 1909 pupils; special and technical schools, 10, with 2063 pupils; professional colleges, 11, with 1441 pupils. Of all the pupils in these government schools, only 3158 were female, of whom 2666 were in kuttabs and 401 in primary schools. Exclusive of kuttabs, there were in 1908 735 schools, with 113,430 pupils; 335 schools, with 66,049 pupils, were Egyptian institutions, and the remainder were foreign. Of the total number of pupils, Mohammedans numbered 54,186; Copts, 28,961; other Christians, 22,908; Jews, 7149. According to the census of 1907, the population by religion was: Mohammedans, 10,269,445; Christians, 881,692 (including 743,981 Orthodox Greek, 72,320 Roman Catholics, 37,446 Protestants, 27,937 Oriental); Jews, 38,635; others, 206. The two great seats of Koranic learning are the Mosque and University of El Azhar, at Cairo, with about 10,000 students, and the Mosque of El Ahmadi, at Tantah, with over 5000 students.

PRODUCTION. Of the industries, agriculture is by far the most important. In general, mining is carried on to a very limited extent, but about 1,000,000 tons of salt are produced annually and large numbers of turquoise are obtained in the Sinai Peninsula. The cultivated portion of the country is confined to the area annually inundated by the Nile or capable of being irrigated by canals. Irrigation and the

conservation of the Nile waters are facilitated by extensive reservoir works, consisting of a dam at Assuan, a barrage and lock at Assiut, and a barrage at Zifta and at Esna. In 1907 6,420,000 feddans (1 feddan = 1.03 acres) were under cultivation. The principal crops are cereals, cotton, sugar, clover, and vegetables. Wheat production in 1907 is placed at 12,000,000 bushels; corn, 30,000,000 bushels; sugar-cane, 500,000 tons. For 1907-8 the area under cotton is reported at 1,003,271 acres, yielding 716,166,000 pounds and 705,088 bushels of seed; 1908-9, 1,638,040 acres, yielding 678,349,000 pounds and 649,026 bushels of seed; estimate for 1909-10, 1,597,000 acres, yielding 544,450,000 pounds and 569,805 bushels of seed. See IRRIGATION.

COMMERCE. The foreign commerce of Egypt is reported as follows, in Egyptian pounds valued each at \$4.943:

	1908	1907	1908
Imports, mds.....	24,010,795	26,120,783	25,100,397
Exports, mds.....	24,877,280	28,013,185	21,315,673
Imports, specie....	9,077,402	7,768,190	4,205,083
Exports, specie....	2,067,706	4,736,189	4,671,206
Transit	844,702	1,131,801	1,138,567

The leading values, in Egyptian pounds, for imports in 1907 and for exports in 1907 and 1908 are stated as follows:

Merchandise	Imports 1908	Exports 1907	Exports 1908
Cereals (and vegetables)	3,785,196	3,189,492	3,157,588
Wood, coal, etc....	8,358,623
Cotton textiles	3,276,250
Other textiles	3,179,286
Metals and mfg....	2,957,461	3,766	6,494
Spirits, oils, etc....	1,254,656	13,951	12,001
Provts. (and drugs)....	1,182,679	113,283	107,723
Tobacco	860,542	393,509	364,977
Chemical products..	730,054	28,730	21,800
Skins and leather goods	380,427	148,233	141,598
Raw cotton	23,597,851	17,091,612

The transit trade consists mainly of coal imported and re-exported at Port Said. The figures for tobacco exports represent re-exports in the form of cigarettes. Formerly Egypt not only supplied her own wants in flour and sugar, but exported those products in considerable quantities. Now the export trade depends almost entirely on the quantity, quality, and price of the cotton output. Practically the whole decline in exports in 1908, as compared with 1907, is attributable to the decrease in the value of the cotton shipments. These shipments in 1906 aggregated 6,696,567 cantars (of 99.0492 pounds each); in 1907, 6,859,223 cantars; in 1908, 6,348,493 cantars. In the special trade, imports from and exports to the countries commercially most important have been valued in Egyptian pounds as follows:

Countries	Imports 1908	Exports 1907	Exports 1908
Great Britain	8,264,613	15,225,116	11,147,800
Turkey	3,192,976	337,410	385,695
France	2,915,817	2,040,533	1,681,331
Austria-Hungary	1,632,273	1,815,397	1,030,072
Italy	1,187,786	791,044	704,070
Germany	1,118,997	2,252,964	1,848,323
Russia	974,014	1,599,580	1,377,577
Belgium	725,747	90,251	81,820
America (mostly U. S.)	558,703	2,101,785	1,157,006

COMMUNICATIONS. The length of state railways on December 31, 1908, was 1464 miles, exclusive of the Sudan military railway to Khartoum and of about 780 miles of agricultural light railways privately owned. In 1908 the state lines carried 22,851,861 passengers and 3,927,644 tons of freight, the net receipts being ££1,353,220. In 1909 it was reported that the Turkish and Egyptian governments had agreed upon the construction of a junction railway between Syria and Egypt. Telegraph lines (1908) aggregated 2907 miles, with 12,480 miles of wire and 321 offices; post-offices and stations numbered 1547. In 1908 2127 steamers, of 3,535,164 tons, entered the port of Alexandria and 2129, of 3,552,483 tons cleared; about 40 per cent. of the tonnage was British. See SUEZ CANAL.

FINANCE. The monetary unit is the Egyptian pound, valued at \$4.943. Revenue and expenditure in Egyptian pounds have been as follows:

	1906	1907	1908
Revenue.....	15,337,294	16,367,818	15,521,775
Expenditure... .	13,161,863	14,280,413	14,408,144

For 1909 the estimated revenue was ££15,100,000, and the estimated expenditure, ££14,850,000. The principal sources of estimated revenue were: Direct taxes, ££5,434,000; railways, 3,425,000; customs, 1,880,000; tobacco, 1,575,000; ministry of justice, 1,105,000. The larger items of estimated expenditure were: Administration, ££4,690,504; service of the debt, 3,931,071; railways, 2,153,658; army, 1,420,569 (Egyptian army, 734,319; army of occupation, 146,250; pensions, 540,000); Turkish tribute, 665,041; Sudan deficit, 335,000; civil list, 279,378. On December 31, 1907, the total debt amounted to ££95,833,280; on December 31, 1908, ££95,513,460. On the latter date the general revenue fund stood at ££7,374,891.

ARMY. The Egyptian army in which all male inhabitants are liable for service is under the command of a British officer with the title of Sirdar who is also Governor-General of the Sudan. In 1909 the incumbent was Lieutenant-General Sir Reginald Wingate, and with him there were 188 British officers attached to the Egyptian army. The native army in 1909 numbered 17,507 and included infantry, cavalry, artillery, camel corps, and Arab battalions. The British troops under the command of General Sir J. G. Maxwell, in 1909, amounted to 6015 officers and men and included one cavalry regiment, one horse battery, one garrison company, one company Royal Engineers, four infantry battalions, the Third Battalion of Coldstream Guards and various details. The Egyptian artillery has been trained to European standards and is equipped with Krupp field and mountain guns.

GOVERNMENT. The head of the government is the Khedive, Abbas Hilmi since January, 1892. There is a legislative council and a legislative assembly (forty-six of whose members are elective), but they are consultative bodies, the final legislative power being vested in the Khedive and his ministers. No financial measures, however, can be taken without the concurrence of the British Financial Adviser (H. P. Harvey in 1909), while the real ruler of the country is the British Agent, Consul-General, and Minister Plenipotentiary (Sir Eldon Gorst since 1907).

HISTORY. The Egyptian Nationalist Movement continued throughout the year. On February 2 the General Assembly was opened by the Khedive. Its members renewed the demand for the establishment of a Chamber of Deputies. A strike of students occurred on January 24 in the El Azhar University against certain reforms authorized by the government the year before. These reforms were of an elementary character, designed merely to render the institution a university in the Western sense and comprised such points as the requirement to pass examinations, but the Moslem population regarded the institution as a mosque where students met for purposes of education rather than an actual university. The conservative students objected to the changes, and they were joined by others who were discontented with the food and accommodations. The Rector resigned and a fracas having occurred with the authorities a number of the students were arrested. The reform measures, however, were cancelled. The Nationalist Press bitterly attacked the government officials who betrayed great sensitiveness to criticism and lost their courage. In March, the Press Law of 1881 was revived on this account. On March 31 and April 1 there were popular demonstrations against this press law, chiefly by students and by men said to be out of employment. In July a law was framed for placing under police supervision persons known to be in the habit of making, or threatening, attempts on life or property. The views of the Nationalists were expressed at the Young Egypt Congress which met on September 18 at Geneva and comprised 120 Egyptian delegates, two representatives of the British Labor party and two of the Irish party. There were some inflammatory speeches and much sharp criticism of the British occupation. The Egyptian delegates declared that they had been ready for independence twenty-seven years ago and that although it might take them a hundred years to fit themselves for self-government they did not desire or need foreign intervention. They referred to the oppression under which the 12,000,000 people were suffering. The Irish representatives coupled Egypt and Ireland together as "two disinherited nations," each with the same enemy, namely, the "cold and stupid England," etc. The Congress was marked by many speeches against the English policy and their persistency in Egyptian occupation after they had promised to withdraw. On April 1 the Khedive inaugurated the opening of the port and harbor of Port Sudan. An important archaeological discovery was made by Professor Sayce, who was reported, early in February, to have found the site of ancient Meroë. See ARCHAEOLOGY.

EGYPT, EXCAVATIONS IN. See ARCHAEOLOGY.

ELECTORAL REFORM. SHORT BALLOT. "The Short Ballot" is a handy phrase used to denote the proposal to simplify the methods of popular control of government in our cities and States. Its advocates believe that such simplification is necessary before the people can effectively control their government. At present, the voter on election day is confronted with a long ballot, containing many insignificant offices and a greater number all told than he is likely to gather information and develop opinions about. The average voter can possibly speak with intelligence of three or four of the candidates whom he supports at the polls, while he cannot even recall the names of the remainder.

Such blind voting gives power to politicians, makes necessary political machines and creates the jungle of obscure powers and influences described by Judge Lindsey in *The Beast and the Jungle*. (See also *Proceedings* of the Cincinnati Meeting of the National Municipal League.) All this complexity is not only dangerous, but is entirely unnecessary. Minor offices can be made appointive instead of elective. Election schedules can be rearranged, and terms of offices lengthened until the voter on election day is called upon to select no more candidates than actual practice demonstrates he is likely to be able to select intelligently.

The idea of reducing the number of elective offices is not a new one, but an effective movement has been launched (May 1, 1909,) by The Short Ballot Organization, of which Dr. Woodrow Wilson of Princeton is President, Winston Churchill, Horace E. Deming, Clinton Rogers Woodruff, William Allen White, Ben B. Lindsey and William S. U'Ren are Vice-Presidents, and Richard S. Childs, Secretary. It has made a campaign among college professors and secured the use of its pamphlets in the political science classes of thirty-five universities. It is also running a campaign of publicity through newspapers and pamphlets, to explain the idea to the American people.

The Short Ballot principle in essence is, that only those offices should be elective which are important, attract (and deserve) public examination, and that very few offices should be filled by election at one time, so as to permit adequate and unconfused public examination of the candidates. Obedience to these fundamental principles, in the judgment of its supporters, explains the comparative success of democratic government in the cities of Great Britain and other foreign democracies, as well as in Galveston, Des Moines, and other American cities that are governed by "Commissions." Whether this claim is wholly justified, there is no doubt that a conspicuous feature of the movement for the commission form of municipal government is the impetus which it has given to the movement for the Short Ballot, and no small part of its success may be attributed to the fact that it simplifies the issues presented to the elector, in that he is called upon to choose but five officials charged with the duty of carrying on the whole city government. This represents a striking contrast to the burden placed upon the shoulders of the elector in the large majority of American cities, where he is called upon to select "platoons" of administrative, judicial and legislative officers, not to mention school directors and election officers. The consequence is, as has been pointed out at the meetings of the National Municipal League for many years, the elector is by force of circumstances compelled to depend either upon some party for advice and suggestion, or upon some volunteer organization like a municipal voters' league or civic association.

BALLOT REFORM. Ballot reform, that is, the question of the form and make-up of the official ballot containing the names of the candidates, is again assuming an important place in the consideration of a number of States, and notably is New York and Pennsylvania, where an undue advantage is given the straight party voter, and where the complexity and size of the ballot tend not only to confusion, but to the diversion of the will and purposes of the voters. According to William M. Ivins, probably 30 or 40 per cent. of

the most intelligent men in Tammany Hall have come to see that the Massachusetts ballot must be adopted. The leaders of the Republican party in Greater New York are in favor of the Massachusetts system.

NOMINATION REFORM. Nomination reform has been a burning issue in New York and Illinois. Michigan, New Hampshire, Idaho, Nevada and California have within a short time abolished nominating conventions and installed in their place a system of direct nomination. Nineteen States now possess a mandatory system of direct nominations covering all offices except that of delegate to the national nominating conventions. These are California, Idaho, Illinois, Iowa, Kansas, Louisiana, Michigan, Mississippi, Missouri, Nebraska, Nevada, New Hampshire, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Washington and Wisconsin. In three States, Minnesota, Ohio and Pennsylvania, there is a mandatory system of direct nominations covering all offices excepting positions in the State government and delegates to the national nominating conventions. In four States, Alabama, Florida, Kentucky and Tennessee, there is an optional system of direct nominations covering all offices except delegate to the national nominating conventions. In four States, Indiana, Massachusetts, New Jersey and Tennessee, there is a mandatory system of direct nominations applying to certain localities or offices. In ten or more States there is an optional system of direct nomination covering certain localities or offices: Connecticut, Delaware, Indiana, Maryland, Maine, Massachusetts, New York, California and Rhode Island. In most of the Southern States direct nominations prevail in the majority party.

In New York, Governor Hughes has forced the issue for direct nominations. He is to-day the most prominent and conspicuous representative in office of the growing public protest against what he describes as "the control of the powers of government by selfish interests." Both in his formal messages and in his speeches he has presented the issue clearly and concisely. In one of the former he declared:

"In theory, party candidates are selected by those who have been chosen by the party voters to represent them in conventions. In practice, the delegates to nominating conventions are generally mere pieces on the political chessboard, and most of them might be inanimate so far as their effective participation in the choice of candidates is concerned. Party candidates are in effect generally appointed by those who have not been invested with any such appointing power."

This practice, in his opinion, has had four unfortunate results. It has had a disastrous effect upon party leadership; it tends to discourage party voters from participation in the affairs of the party. Candidates too often regard themselves as primarily accountable, not to their constituents, nor in the broad sense to their party, but to those individual leaders to whom they realize they owe their offices, and upon the continuance of whose favor they feel that their political future depends. The fourth evil, and the most serious, is the consequence to the people at large: "To the extent that party machinery can be dominated by the few, the opportunity for special interests which desire to control the administration of government, to shape the laws, to prevent the passage of laws or to break laws with impunity, is increased. These interests

are ever at work, stealthily and persistently endeavoring to pervert the government to the service of their own ends. All that is worst in our public life finds its readiest means of access to power through the control of the nominating machinery of parties."

The Hinman-Greene Bill embodies Governor Hughes's ideas. Its principal features are: Designation of candidates for nomination by party committees instead of the present convention system. All candidates for party committees to be nominated by petition only, signed by a specific number of enrolled voters. The basis of representation of each committeeman is made proportionate to the vote cast in his district for the candidate of his party for governor at the preceding gubernatorial election. The State committee may be elected from Congressional, Senatorial or Assembly districts, as the parties may for themselves determine. There is to be an official primary ballot, with the names of all the candidates grouped under the title to the office and numbered consecutively, the party candidates receiving a preferential position. All primaries are to be held on the same day. Party platforms are to be framed by a party council to consist of the members of the State committee and the candidates nominated for State offices. Provision is made for severe punishment for attempted corruption at the primaries, and the lavish expenditure of money is restrained by provisions limiting and defining the purposes for which money may be expended.

Governor Hughes has carried the fight directly to the voters, and as a consequence the number of avowed advocates of direct nominations was doubled in the election held on November 2, 1909. As an offset to the Governor's campaign, the legislature appointed an investigating committee, all but one member of which were open and avowed opponents of his plans in this connection. This committee made a tour of the country, investigating direct nomination laws in the several States, and is expected to make a formal report at the next session of the legislature. The one advocate of direct nominations who was appointed to the committee declined to serve, on the ground that the purpose of the committee was unquestionably to discredit the movement and its recommendations were a foregone conclusion. For this reason the work of the committee has not been seriously considered by students of the problem. Far more attention had been given to Governor Hughes's campaign, and to the work of the Direct Primary Association, which has been an effective coadjutor.

DIRECT VOTE. The efforts of the Illinois Legislature to provide nomination reform, for the third time, have been overturned by the Illinois Supreme Court. It must be frankly admitted, as one member of the legislature pointed out, that the recent decision of the Illinois Supreme Court declaring the last primary law unconstitutional will make it difficult to induce the legislature to pass a satisfactory measure. The court has held that a primary is an election. The question therefore arises, whether or not it will be necessary to give to the elector at a primary election the right to cumulate his votes that he now has at a general election. Governor Deneen and his supporters are pledged to carry on the fight, and a special session has been called to deal with the question. There are now 29 States in which there is a direct vote on United States Senators: Alabama, Arkansas, California, Florida, Georgia, Idaho, Iowa,

Kansas, Kentucky, Louisiana, Maryland, Michigan, Mississippi, Missouri, Nebraska, Nevada, New Jersey, North Dakota, Ohio, Oklahoma, Oregon, South Carolina, South Dakota, Tennessee, Texas, Virginia, Washington, Wisconsin. It must be noted, however, that in the several Southern States the direct nomination of United States Senators is under party rules (particularly Democratic party rules) and only indirectly covered by the State primary law through provisions authorizing such rules. The list above given includes States where the direct nomination is used, however the system may be authorized or provided for.

RECALL. Interest in the recall continued unabated during the past year. In fact, the utilization of this new measure of popular control by the electorate of Los Angeles brings forcibly to mind its rapid development. (See paper presented to the National Municipal League at its Pittsburgh meeting in 1908.)

This year's Nevada Legislature submitted to the next legislature a constitutional amendment establishing in the people a power to recall their public officers. The new Boston charter contains a modified recall; and nearly all the new commission governed cities have it. The recall has been used successfully in Los Angeles, in Junction City, Kansas, and in Estacada, Arizona.

It remained, however, for Los Angeles, which originated the recall as an instrument of popular control in municipal affairs, to afford the most extended application of the provision thus far had. The Los Angeles Municipal League with the coöperation of other civic organizations undertook the recall of Mayor Harper because, as they alleged, he had made unfit appointments to office; had failed to keep his personal promises as well as his election pledges; had used the offices at his disposal to pay political debts; had been a party to marketing the stock of a corporation in which he and members of his police commission were large holders and promoters, among the very people—like the owners and keepers of saloons and houses of ill-fame—whom the police commission is charged with regulating and controlling; because during the two years preceding, gambling had existed unchecked for long periods, and certain saloons and lodging houses had been allowed to do about as they pleased, while others had been held rigidly to the law; because thuggery and house-breaking had been carried on to an intolerable degree; because the city was about to spend \$25,000,000 in the Owens River Aqueduct enterprise and because the make-up of the board which had in charge the expenditure of this money was a matter of vast and imperative importance to the taxpayers. It was only natural that there was objection to this course of procedure, the allegations being made that the proper course for the League and its allies to have pursued was through the courts. Mayor Harper resigned before the vote was taken. At an election held to fill the vacancy the Municipal League's candidate was elected by a substantial majority and the forces for decent and efficient government won a two-fold victory: first, in securing the elimination of an admittedly bad mayor and, second, the substitution in his place of a competent successor.

The Boston recall plan is an interesting modification of the Los Angeles idea. The mayor is elected for four years and at the general election in the second year of his administration the

question shall be submitted to the voters as to whether he shall continue for the full term, or whether he shall be re-elected at the following January election. If the vote is an affirmative one, there must be an election for mayor in the following January, and the name of the incumbent goes on the ballot without further formality. Other candidates may be nominated for the office at the same time. The mayor, if he wishes, may announce in the October of the second year of his administration his desire to drop out of the office, in which event there will be an election for mayor in the following January, but he may change his mind between October and January and become a candidate at the January election if he wishes.

CHARTER REFORM. Berkeley (California) has a new charter which contains provisions closely analogous to the two election systems in vogue in France. All nominations to elective offices are made by petition only, by filing with the City Clerk 25 certificates of nomination each signed by one voter, there being no limit to the number of candidates for any given office. If at the regular municipal election any office is not filled, then a second election must be held three weeks later. At the first election the candidate receiving the highest number of votes for the several offices in question shall be deemed elected, provided that number is "greater than one-half the number of ballots cast at such election." In case of any non-election, then, as far as unfilled offices are concerned, the regular election becomes a primary and the two candidates who received the highest number of votes (or three in case of a tie) become the nominees to be voted for at the second election. At the first election (May 1, 1909) under the new charter there were four candidates for mayor, four for auditor, twenty-nine for councilmen or commissioners, and twenty-one for school directors—there being four councilmen and four school directors to be elected. The large number of candidates produced some confusion in the minds of voters at first; but it was soon seen that most of them were negligible and could be easily eliminated. There were ten candidates for councilmen and ten for school directors that were to be taken seriously. Very satisfactory candidates had been brought out by the non-partisan nomination. The first election was very interesting, about 70 per cent. of the qualified voters participating. A strong fight was put up by the local political machine to retain control, and a popular political leader was nominated for mayor—a strong vote getter; but the "Good Government" people were well organized and did not allow themselves to be deluded. At the last moment a partisan call to stand by the party as against any non-partisan ticket, a cry that had always worked successfully under the old methods of nomination, was made, but the result of the election was a decided victory for the "Good Government" forces, the candidate for mayor receiving a clear majority over all other candidates, as did the candidate for auditor. Among the highest eight candidates for councilmen, the first four were "Good Government" candidates; and it is doubtful whether more than one of the remaining three could be called political candidates in the ordinary acceptance of the term. At the second election the "Good Government" forces were again completely successful.

COMMISSION. Colorado Springs, which adopted the main ideas of the commission form of govern-

ment, followed Berkeley's lead in substituting second elections for direct primaries. The councilmen were elected at the first election; but it required a second election to determine the choice for mayor. In place of the Berkeley-Colorado Springs plan, the new Grand Junction charter provides for a complete unification of primaries and elections at each election and for the choice of candidates in proportion to the number of their respective supporters. In the words of the official summary: "The preferential system of voting has been established in lieu of direct primaries or of second elections, thus securing a unique and accurate expression of the public will at the polls with the minimum of cost and effort." This innovation is a form of proportional representation now widely used in Australia. So far as we are informed, it has never been adopted in the United States except possibly in a modified way in the State of Idaho.

The official ballot used at the election on November 2, 1909, contained these instructions: "To vote for any person, make a cross (x) in ink in the square in the appropriate column according to your choice, at the right of the name voted for. Vote your first choice in the first column; your second choice in the second column; vote any other choice in the third column; vote only one first and only one second choice. Do not vote more than one choice for one person, as only one choice will count for any candidate by this ballot. Omit voting for one name for each office, if more than one candidate therefor." The results seem to have given satisfaction, the successful candidates representing the choice of the majority.

INITIATIVE AND REFERENDUM. Portland, Oregon, for the second time, gave the initiative and the referendum a severe trial. In the opinion of thoughtful observers, altogether too many questions were submitted to the electors at the June election, the ballot containing the questions being 16 inches by 22 inches. It had on it the names of candidates for 8 offices, and 35 separate questions. The election seems to have been most intelligently conducted. There was a great amount of advance information and advice sent out in the way of circulars, pamphlets and a very carefully prepared report from the Taxpayers' League. The election was quietly conducted without the slightest suspicion of any improper voting, the progressives identified with the Taxpayers' League expressing themselves as being on the whole exceedingly well satisfied with the result. On one or two minor points its recommendations were overruled; but only such issues as were considered proper were passed. The vote for mayor was 18,000 and on the referenda it averaged 15,000—a surprisingly large proportion.

Arkansas's Legislature submitted to the people this year a constitutional amendment for the establishment of the referendum and initiative, the system proposed being the one now in use in Oregon. Nevada's Legislature took the first steps toward amending its constitution along similar lines. In municipal affairs wherever the Des Moines plan of government has been adopted, it has been in conjunction with provisions providing for the initiative, referendum and recall. Kansas has established the initiative and referendum in all the cities of the State. Following are the States where the initiative and referendum are used in some of the cities or in all of them: California, Colorado, Delaware,

Idaho, Iowa, Kansas, Maine, Massachusetts, Mississippi, Missouri, Minnesota, Montana, Nebraska, North Dakota, Oklahoma, Oregon, South Dakota, Tennessee, Texas, Washington; in all 20 States. The States where the initiative and referendum are in full operation for statute and municipal law are: Maine, Missouri, Montana, Oklahoma, Oregon and South Dakota. In all of the States so far mentioned, except Maine and Montana, the initiative applies to constitutional changes.

PARTY DESIGNATIONS. In regard to the elimination of national party designations from municipal ballots and the establishment of non-partisan elections, Robert Treat Paine, Jr., in a paper read before the National Municipal League at its meeting in Cincinnati in November, 1909, declared that that reform is making rapid progress. Four States, by general law, permit its establishment by cities. In ten other States cities are now operating under a non-partisan plan. In as many more States cities are seeking charter amendments for similar permission. The fact that some cities which have lately adopted it, like San Diego and Los Angeles, discussed and adopted important charter amendments as recently as 1905 and yet at that time made no provision for non-partisan elections, shows what great headway this idea has lately made and that it is now no longer academic, but is one that the people are ready to enforce as a governing principle in their civic life. In the effort to eliminate national party organizations from city elections, there has been no discrimination in favor of municipal parties. All political designations have generally been debarred. The Haverhill plan expressly forbids anything on the ballot indicative of the candidate's views or opinions. Kansas, in its short-lived law of 1907, did permit the use of three words for the expression of political principles. As there are important and even fundamental local questions about which citizens may properly and logically disagree, and as it is needful that the fullest publicity should be given to the position of candidates upon such questions, it may be well that municipal parties will be organized and given due recognition in the election laws. In Mr. Paine's judgment at the present time, however, in the present stage of the contest against politicians, it is probably wise to simplify the issue, as is now being done where this issue is raised, and leave to time and evolution any necessary modification of the general principle of the elimination of partisanship from cities.

In other directions there have been numerous interesting developments. Pennsylvania has adopted a series of constitutional amendments providing for annual elections and the complete separation of local from State and National elections. Corrupt practices legislation is being proposed in many directions. Maryland defeated amendments intended to disfranchise the negro. Pennsylvania and Illinois are codifying their elections laws. In the latter State the proposition has been seriously advanced that the election officers should be subjected to a written examination.

ELECTRICAL INDUSTRIES, GROWTH OF IN 1909. The year 1909 was marked by rapid recuperation in the electrical industries. The high record of 1906 was not attained, but the records of the two preceding years were greatly surpassed. A leading engineering journal offers the following estimates of sales and earnings:

	1908	1909
Electrical apparatus.....\$ 250,000,000	\$ 275,000,000	
Electric railways..... 350,000,000	475,000,000	
Central stations..... 225,000,000	250,000,000	
Telephony	200,000,000	250,000,000
Telegraphy	50,000,000	60,000,000
Isolated plant supplies.. 75,000,000	75,000,000	
Miscellaneous	40,000,000	50,000,000
Total	\$1,190,000,000	\$1,435,000,000

There has been a sustained and healthy growth among the central stations. Exceptional activity was shown in the realm of the industrial applications of electric motors. A great gain was made in the electric lamp industry, due to the widespread use of the expensive metal filament lamps. The manufacture of telephone equipment remained very much below the mark set by 1906.

ELECTRIC LIGHTING. The epoch-making developments in electric lighting during the years 1907 and 1908, chief among which were the widespread introduction of metallic filament incandescent lamps, of flame arcs and of metallic-oxide arcs, continued without abatement through 1909. In the incandescent lamp field there has been a conservative tendency in the matter of efficiency and efforts have been concentrated upon the improvement in the quality, the uniformity and life of the product. The practicability of the tungsten filament has been demonstrated beyond all doubt and it is successfully applied to conditions which were at first regarded as far too severe to permit its use. It is the growing opinion of scientists that its superior efficiency is due in no small measure to the property of selective radiation which causes a greater per cent. of the energy supplied to it to be radiated as light, than would be the case with other materials. Much research has been devoted to the problem of discovering still more effective means of employing this phenomenon.

The Nernst lamp, whose glowers consist of a mixture of the rare earth oxides, has been much improved during the year. By the use of a heating device which becomes immediately incandescent upon closing the switch, the instantaneous-lighting property has been supplied.

Much attention has been given to the problem of producing electric illuminants which closely reproduce the quality and color of diffused daylight for use in the lighting of stores and color printing establishments. This has led to the introduction of a new type of arc lamp known as the intensified arc. Its distinctive feature is the use of two long, thin carbon rods which incline slightly toward the top of a single upright lower electrode. A double arc is thus formed, the thin upper rods serving as positives. Because of the high current density, their tips are raised to a temperature much higher than that ordinarily reached in the arc, yielding a surpassingly white light of excellent efficiency.

New standards of performance for flame arcs were set by the employment of the regenerative principle. The arc is formed between vertical electrodes in an enclosed glass cylinder. The vapor produced at the arc rises to the top of this cylinder, and is led off through ducts by which it is again readmitted to the arc cylinder at the base. By reason of this circulation the arc vapor is used again and again, so that a portion of its heat is conserved, and the rate

of burning away of the electrodes to supply the arc is greatly reduced. An efficiency of four lower hemispherical candle-power per watt is secured and a life per trim of 70 hours.

For street lighting, very extended use has been made of the magnetite arc first introduced in 1906. This arc is of the luminous type, its light being derived from the white arc flame of titanium oxide. Its efficiency is such as to permit a greatly improved standard of illumination to be maintained at a reduced cost of operation. Flame arcs with vertical electrodes have been applied to a considerable extent to street lighting. Such arcs are usually mounted on extra high poles so as to cast a great flood of light over a wide area. Constant-current tungsten lamps operated on series circuits have had a very wide and successful use in heavily shaded residence streets to which arcs are not well adapted. The general improvement in the standards of street lighting was one of the most noteworthy achievements of the year.

An event of most fundamental importance to the lighting industry was the unification of the units of light maintained in America, Great Britain and France, and the establishment of a simple ratio between the new international unit and that maintained in Germany. The following relations have now gone into effect:

1 International Candle = 0.10 Vernon-Harcourt Unit.

1 International Candle = 1.00 Bougie Decimale.

1 International Candle = 1.00 American Candle.

1 International Candle = 1.11 Hefner Unit.

1 International Candle = 0.104 Carcel Unit.

The prototype of the new unit is to be maintained in America by the United States Bureau of Standards.

ELECTRIC POWER, TRANSMISSION OF. See TRANSMISSION OF ELECTRIC POWER.

ELECTRIC RAILROADS. The progress of electric railroading during 1909 was of a conservative character. It consisted largely in the continuation of projects begun in the two preceding years, and in the higher refinement of existing equipment. In contrast with the years just preceding, no new electrification projects of magnitude have been undertaken in America, though there is much activity in European systems. Electric locomotives have been put in operation on the Dessau-Bitterfeld section of the Prussian state railroads, and extensions are in progress. The Austrian government is planning the electrification of various sections of its lines operating with heavy grades, amounting to about 600 miles in the aggregate. The Italian government has begun work on 200 miles of electrification of state railroads which will occupy three years. The Western Railroad system in France has been taken over by the state, and electricity is to be substituted for steam in suburban sections having very heavy traffic.

The most noteworthy achievements for the year in heavy traction in America have been the completion of the Pennsylvania tunnel system, extending from Harrison, N. J., under the Hudson River, the Island of Manhattan and the East River to Long Island, a distance of 5.07 miles, with a surface extension on Long Island of 0.83 miles; the completion of the electrification of 40 miles of track of the Long Island

system; the beginning of operation on the Cascade tunnel section of the Great Northern system; and the approach to completion of the Detroit River tunnel of the Michigan Central Railroad. The New Haven system has projected the extension of its electric system from Stamford to New Haven, and has introduced high speed freight service operated by electric locomotives on the electrified division.

While the financial situation among the railroads has shown a healthy recuperation in 1909, the record of construction for the year shows a new mileage of but 887.16, as compared with 1258.51 for 1908, and a still larger figure for 1907. This reduction is ascribed to the after-effects of the late financial depression.

No new types of equipment have been introduced, but the performance of the recent types has been much improved. Some advance has been made in the standardization of electric equipment for various conditions. The installation of 600-volt, direct-current equipment in the Pennsylvania tunnel system beneath New York, and on its connecting lines in Long Island, and the selection of this system for the Michigan Central tunnel at Detroit, tend to emphasize its superiority for the congested traffic conditions in city terminals. The high degree of perfection attained by the single-phase alternating-current equipment of the New Haven system points to the extensive use of this system on railway trunk lines. The operation of the three-phase alternating-current installation on the Cascade tunnel division of the Great Northern Railway has been successfully begun and gives indications that similar equipment may afford great advantages where track conditions are simple and heavy grades prevail.

The field of interurban traction is divided between the single-phase and the 100-volt direct-current systems. The progress of the latter in 1909 has been noteworthy. Eleven such roads are now in operation, comprising 380 miles of track, and an aggregate motor capacity of 60,000 horse-power. The success of this system is due to the use of auxiliary commutating poles in the motors, by which sparking troubles and excessive brush wear have been fully overcome. The practicability of still higher voltage in direct-current systems seems assured, and its adoption is confidently expected.

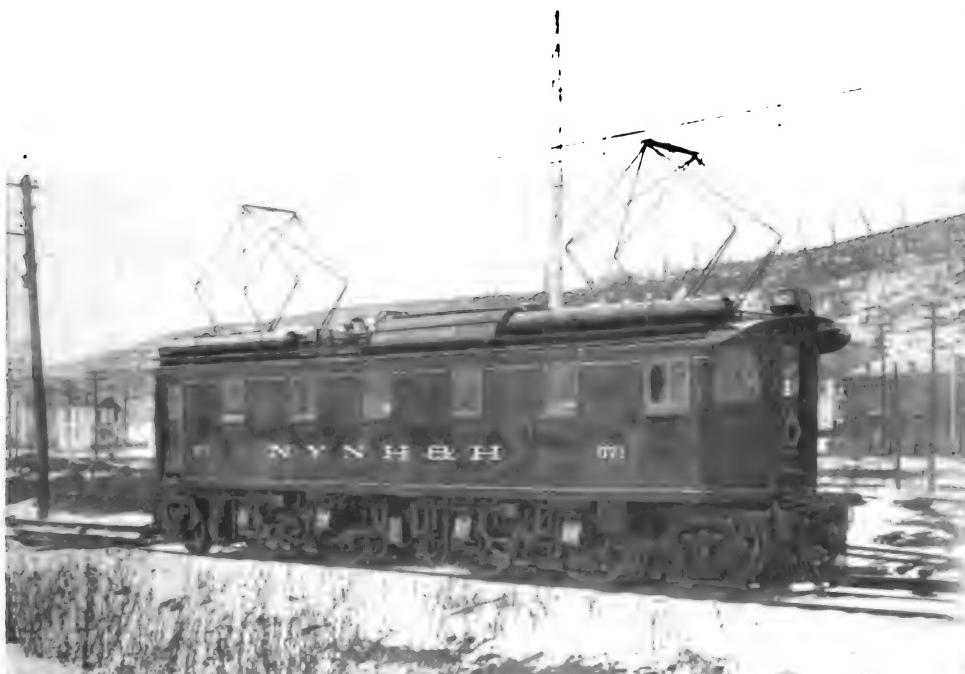

In the design of heavy electric locomotives there is a marked tendency away from geared motors toward side rod connections similar to those employed in steam locomotives. The advantages gained are threefold, viz., greater capacity because of the greater space available for the motors, the spring support of the motors on the side frame, and the higher centre of gravity. The new locomotives of the Pennsylvania system for use in its New York tunnel typify the possibilities of such construction. The weight is 332,100 pounds, of which 208,000 pounds are carried by the drivers. The motors develop 4000 horse-power and are capable of maintaining heavy service at a speed of 72 miles per hour. Each locomotive has a drawing power equivalent to that of two heavy steam passenger locomotives. Much success has attended the use of gasoline-electric motor cars on branch roads which are operated at a loss by steam power, and on which the light traffic does not warrant the heavy expense of electrification.

Managers of city systems complain of the in-

PENNSYLVANIA TERMINAL AND TUNNEL LOCOMOTIVE

Direct Connected Side Rod Type for 650 Volts Direct Current. Equipped with two Westinghouse Railway Motors driving 68-inch wheels. Weight of locomotive 166 tons. Horse power, one hour rating, 2000.

NEW YORK, NEW HAVEN, AND HARTFORD FREIGHT LOCOMOTIVE

Alternating and Direct Current, Twin Gear, Spring Drive Electric Locomotive. Equipped with four Westinghouse Railway Motors driving 62-inch wheels. Gears 34 : 79. Uses 25 Cycles Single Phase Alternating Current at 11,000 Volts and Direct Current at 650 Volts. Weight of locomotive 150 tons. Horse power, one hour rating, 1585.

creasing difficulty of maintaining adequate and profitable service on the 5-cent basis of fare with free transfers. The rejection of the political programme of municipal ownership and reduced fare in the Cleveland election is considered by many as an evidence of change of the public attitude toward this problem.

ELEMENTS, CHEMICAL. See CHEMISTRY.

ELGAR, FRANCIS. An English naval architect, died January 17, 1909. He was born in 1845, and was educated at the Royal School of Naval Architecture and Marine Engineering. From 1867 to 1871 he was in the Admiralty service, and from 1879 to 1881 was adviser on naval construction to the Japanese government. In 1883 he became professor of naval architecture and marine engineering at the University of Glasgow, serving until 1886. He was director of the dockyards of the Admiralty from 1886 to 1892. Following this he was employed as naval architect by private companies. He wrote *Ships of the Navy* (1873), and many professional papers.

ELIOT, CHARLES WILLIAM. An American educator, president emeritus of Harvard University, and until May 19, 1909, president. He was born in Boston in 1834, and prepared for college at the Boston Latin School, graduating from Harvard College in 1853. From 1854 to 1858 he was tutor in mathematics at Harvard, at the same time carrying on the study of chemistry. He was assistant professor of mathematics and chemistry at the Lawrence Scientific School of the University from 1858 to 1863, and from 1863 to 1865 he continued his study of chemistry in Europe, meanwhile investigating educational systems of that country. He became in 1865 professor of analytical chemistry at the Massachusetts Institute of Technology, and held that position until 1869, when he became president of Harvard College. He began at once thoroughly to reorganize the College, introducing new methods of teaching, and securing, as occasion offered, the best teachers to be had in the country. He was one of the earliest and strongest advocates of the elective system, which he introduced at Harvard, and which greatly improved the University's educational efficiency. President Eliot had remarkable administrative ability, and he is generally considered as the foremost American educator of his time. He resigned as president of the University on October 10, 1908, making May 19, 1909, the date on which the resignation should become effective. The resignation was accepted with great reluctance by the trustees of the University.

One of the first of President Taft's acts after the beginning of his administration was to offer to President Eliot the Ambassadorship to Great Britain. The offer was everywhere greeted with approval, but President Eliot, on account of his age and his disinclination to engage in any new work, declined the offer. In March, 1909, he made an extended tour in the South and spoke at many Southern institutions. During this tour he stated that he intended to make a selection of books sufficient to fill a shelf five feet long, the reading of which for ten minutes a day would insure a liberal education. This proposal aroused a great deal of comment, which was not diminished when a partial list of the books was published. It contained titles of several books which are little read, and, for

the most part, forgotten. Dr. Eliot is the editor of this series which is being published by a firm in New York City. Scarcely less comment arose over President Eliot's promulgation, in an address before the Harvard Summer School in July, of what he described as a new religion. In this religion he conceives there will be no authority, either spiritual or temporal, no tribal faith, no sudden conversion, no sacrifice, and no substitute for sacrifice, no belief in malignant powers, no supernatural element, no sacraments except natural hallowed customs, no imagination of the "justice" of God, and no condemnation for the mass of mankind. There will be, on the contrary, a new thought of God as one immanent in the world. The new religion will take account of all righteous persons, and it will reverence the teachers of liberty and righteousness. Prevention will be its watchword, and the skillful surgeon will be one of its ministers. Based on the two great commandments of loving God and one's neighbor, the new religion will teach that he is best who loves best and serves best, and the greatest service will be to increase the stock of good will.

At the commencement exercises of Harvard University in June, President Eliot was made president emeritus. He has written several books, among them *More Money for the Public Schools* (1903); *The Happy Life* (new ed. 1905); and *Four American Leaders* (1906); *Educational Form; American Universities* (1908).

ELLIOT, SAMUEL RICHARD. An American physician and litterateur, died October 26, 1909. He was born in New York City in 1830, and was educated in Columbia College, and in New York Medical College, graduating from the latter institution at the age of nineteen. He studied at the University of Heidelberg, and afterwards went to Paris, where he passed an examination for entrance to the Conservatory of Music. He studied both music and medicine and won high reputation as a musician. After spending some time in Italy and Austria, he returned to the United States and enlisted for the Civil War in the 70th Highlanders, organized by his father. He served as assistant surgeon and surgeon throughout the war, being wounded at the battle of Antietam. After the close of the war he began the regular practice of his profession, and also did a large amount of literary and dramatic work. He became intimate with most of the literary celebrities in New York at the time. He became eminent as a specialist in affections of the eye, ear and throat. Dr. Elliot was one of the first to use music therapeutically. He wrote many essays and sketches which were published in the *Atlantic Monthly*, *Harper's Weekly*, and in other periodicals. He wrote also a number of poems, which were printed in the *Churchman* and in the *Congregationalist*.

ELWIN, EDMUND HENRY. An English bishop of the Established Church, died November 11, 1909. He was born in 1871, and was educated at Dover College and Merton College, Oxford. He was ordained priest in 1895. He engaged in mission work under the Church Missionary Society, and in 1896 was appointed by this society vice-president of its college at Fourah Bay, Sierra Leone. Two years later he became principal of the college, and served

as secretary of the Sierra Leone Mission. In 1901 he was nominated as Bishop of Sierra Leone, and was consecrated in 1902.

EMERSON, ELLEN. Eldest daughter of Ralph Waldo Emerson, died at Concord, Mass., January 16, 1909. She was born in 1839. Miss Emerson acted for many years as housekeeper for her father, and she had a wide acquaintance among the celebrities of the United States and foreign countries. She was of striking personality, and greatly resembled her father in appearance and manner.

EMERY, HENRY CROSBY. American political economist, appointed by President Taft in 1909 the head of the tariff commission. He was born in Ellsworth, Maine, in 1872, and graduated from Bowdoin College in 1892. He studied economics at Harvard and Columbia Universities, and at the University of Berlin, until 1897. In 1894 he was appointed instructor in political economy at Bowdoin College, and from 1897 to 1900 he was full professor of this branch. He was chosen professor of political economy at Yale University in 1900 and still occupies that position. He is the author of *Speculation on the Stock and Produce Exchanges of the United States* (1896), and contributed to the *Cambridge History of the World*. He has also written many articles in economic journals.

EMPLOYERS' LIABILITY. The last few years have developed a marked tendency among more enlightened opinion away from employers' liability as compared with systematic workmen's compensation in cases of industrial accident. In the United States this change has been due both to fairly accurate statistics showing the frightful loss of life in certain industries, and to conclusive evidence showing the inadequacy of the present haphazard system of forced recovery from employers for injury. It was no doubt a great step in advance when the doctrine of assumption of risk by the employee was modified and the employer made responsible for injuries due to his negligence or fault, or that of his principals. But this system makes no adequate provision for the injured workingman's family, or others dependent upon him, who are often the chief victims. The various phases of this entire subject were considered at a conference at Atlantic City, July 29-30, called by the Minnesota Employers' Compensation Commission, and participated in by the Wisconsin Joint Committee on Industrial Insurance, and the New York State Commission on Employers' Liability and Unemployment, together with other public officials and leading actuaries. Those assembled were unanimous in condemning as highly unsatisfactory existing liability laws, in favoring the transfer of the basis of recovery from employers' fault to the industry, and in approving the system whereby the injured employee receives compensation on a definite scale regardless of the employer's negligence. The question of the constitutionality of a system of workingmen's insurance in the United States was thoroughly, but inconclusively, analyzed. It was held by many that

ground for such a law existed in the exercise of the police power. The conference brought out the probable reluctance of employees to surrender their right to sue for damages, and the like reluctance of employers to favor any adequate compensation system that did not relieve them of liability. On this point it was stated that too negligent employers might be made criminally responsible to society, and would be penalized by insurance companies, while employees would surrender their right to sue if compensations were adequate.

After a review of the systems now in use in European countries, the following features of a plan adaptable to conditions in this country were brought out: Weekly or monthly stipends during the entire period of disability instead of a lump sum payment; great flexibility in the methods by which employers may meet their responsibility; but thorough provision that there should be no failure to meet this liability through the insolvency of either the employer or his insurance company; and measures to reduce the number of accidents. The conference authorized a standing committee, and a general conference in 1910, to which the Governors of the States will be asked to send delegates.

Mr. Joseph Cotton, Jr., counsel for the New York State Commission, already mentioned, investigated about 20,000 cases of industrial accident resulting in about 2000 deaths and 4000 permanent injuries. He found that in only about 25 per cent. of these cases did the employees recover anything at all; that where employers resorted to employers' liability insurance companies for protection, recovery by employees was secured in only about 8 per cent. of the cases; and that of the premiums which employers pay to such companies only 30 to 40 per cent. is paid out to injured employees, the remaining 60 to 70 per cent. being absorbed by the expenses of the business, about 15 per cent. being used in fighting claims. When employees' attorneys' fees and other expenses are taken into account, it seems probable that not 25 per cent. of the insurance premiums actually reach injured workmen. Other lines of inquiry taken up by this Commission were the economic effects of industrial accidents, the employers' liability laws in the various States, foreign systems of workmen's compensation for loss due to industrial accidents, causes of such accidents, causes of unemployment, the lack of labor in farming sections, and better means of distributing labor in the State. The Wisconsin and Minnesota Commissions were likewise making exhaustive inquiries and preparing bills dealing with employers' liability and systematic workmen's compensation.

Largely as a result of the disaster in the coal mines at Cherry, Ill., in which about 350 miners lost their lives, Governor Deneen, in his message to the legislature in special session in December, urged the appointment of a commission similar to those of Minnesota, Wisconsin and New York to inquire into employers' liability and workingmen's compensation for industrial injuries. A bill to this end was at once presented, requiring a report by February, 1911. This plan contemplates also the revision of the mining laws, with a view to prevention of such catastrophes in the future.

Convincing evidence of the development of opinion with reference to the chaotic legal

status of employers' liability in this country was contained in the proceedings of the National Civic Federation, November 22-23, in New York. Although the National Association of Manufacturers had only a few days previously declared the present laws, "built up through generations," to be satisfactory, the addressees before the Civic Federation severely arraigned them. Senator Root characterized the present law as foolish, wasteful, ineffective and barbarous. Mr. A. H. Gill, a Labor member of the House of Commons, reported favorably on the English experience under the compensation act of 1906. He emphasized the fact that this law had greatly stimulated the zeal of employers in fencing machinery, and in other ways taking every precaution to prevent accidents. German experience was outlined by Major Piorkowski, of the Krupp works, and French and Swiss laws were detailed by others. Though some trade unions in this country have opposed the idea of workmen's compensation on the ground that it involved a surrender of right to sue, Mr. John Mitchell declared strongly in favor of this idea. He stated, however, that protection is more important than compensation, and that, therefore, progress would result only from some plan that is more expensive than the present condition. Admiral J. B. Murdock, commandant of the Brooklyn Navy Yard, in a very favorable statement of experience with the national compensation act of 1898, declared that it compelled safety, and led to better sanitation. He recommended that the law require the physical examination of all employees. See LABOR LEGISLATION.

ENGINEERING. See articles on various subjects, as AQUEDUCTS, COAL, DYNAMO-ELECTRIC MACHINERY, ELECTRICAL INDUSTRIES, IRON AND STEEL, SANITATION, SHIPBUILDING, STEAM TURBINES, WATER WORKS, and other articles on engineering topics.

ENGLAND, CHURCH OF. A religious denomination which is the "established Church of England," and the dominant religious body of that country. There are at the head of the Church in England and Wales 37 bishops, of whom two, Canterbury and York, are archbishops. The bishops superintend the work in each diocese, and are aided by the suffragan or assistant bishops, of whom in 1909 there were 32. There are two convocations or provincial synods of the clergy of the Church of England for the two provinces of Canterbury and York. The archbishop of Canterbury is the highest dignitary of the Church and has the title of Primate of all England. The bishops of the Church are entitled to seats in the House of Lords. No regular statistics of the Church are gathered, but it is estimated that there are about 30,000 clergy in England and Wales, of whom 14,000 are beneficed, and about 7000 are assistant curates. The number of communicants is estimated at approximately 2,500,000. The church sittings number about 6,000,000.

The most important change in the English episcopate in the year 1908-9, was the elevation of the suffragan bishop of Stepney, the Right Rev. Cosmo Gordon Lang, D. D., to the archbishopric of York, in succession to the Most Rev. W. D. McLagan, who resigned. It is the first case in the history of the Church where a bishop suffragan has been elevated to the archbishopric. Several important problems

have been for some time before the Anglican Church, and no great progress was made upon them during the year. The revision of the Prayer Book still remains in abeyance. At the July session of the Convocation, the most important action was the recommendation of the Lower House, with respect to the use of the Athanasian creed, to the effect that the creed be retained as heretofore, without the existing rubric, and that provision be made for its liturgical use without the warning clauses. The status of persons married under the law passed in 1908, sanctioning marriage with the deceased wife's sister, was a cause for perplexity during the year. A case was carried up to the highest law courts from the diocese of Norwich, in which the priest refused to communicate persons thus married, and the courts decided against the priest. Subsequently, in the Representative Church Council, a declaration was adopted by an overwhelming majority to the effect that, "seeing that all marriages within the prohibited degrees of affinity (whether allowed by the law of the land or not) are wrong, as being contrary to the moral rule of the Church of England, and the principles implied in Holy Scripture as interpreted by it, the use of the Prayer Book's service for the solemnization of holy matrimony in respect to any such marriages is most strongly to be reprobated."

The most picturesque feature of the year in the history of the Church was the great historical pageant on the grounds at Fulham Palace, which took place in June and which illustrated the history of the Church from the earliest times on a magnificent scale. There were nearly 4000 performers, and the spectators reached many thousands more. Of similar interest was the observance of the thousandth anniversary of Wells Cathedral, which was celebrated in June. In the same month the English Church Union observed its fiftieth anniversary.

The Church's Congress of 1909 was held at Swansea, and it was a notable success in numbers and public interest. The subject of Socialism was discussed in its various phases, both by those who approved and by those who opposed its tenets. The subject of Christian Science was also under discussion.

ENTERIC FEVER. See TYPHOID FEVER.

ENTOMOLOGY. As in 1907 and 1908, the most important problems in economic entomology in the United States deal with the gipsy and brown-tail moth in New England, and the cotton-boll weevil in the South. Of lesser distribution in the South, but nevertheless a serious problem, is the Argentine ant, a pest now found mainly in Louisiana, but likely to spread through all of the Gulf States. Newell reported that the animals may be killed by winter trapping. Large open boxes filled with cotton seed, straw, and other waste, were placed in yards, where the contents became moist and began to ferment. The warmth resulting from the fermentation proved attractive to the ants which collected in the boxes in large numbers, and were killed with carbon bisulphide. In summer, the method of trapping was less effective, because the colonies are small and widely scattered and are difficult to reach. It was found that cotton cloth, soaked in corrosive sublimate solution and dried, would not

be crossed by the ants, and that strips of tape, treated in this way and tacked around the legs of tables or edges of shelves, would form efficient repellents. Similar results were reported from South Africa, where this ant also occurs.

No remedy for the cotton-boll weevil was found during the year. W. D. Hunter reported in January that a dry climate is especially unfavorable to its development, so that it does little damage in western Texas, but a correspondingly greater amount in Louisiana and Mississippi. Here, however, a number of parasitic and predatory insects have changed from their original hosts to the weevil, so that the boll weevil "complex" now comprises 49 weevils which feed upon 95 plants, and 97 insect enemies of these weevils. The best hope seems to be in the use of insect enemies of the boll weevil, and a number of forms have been introduced which have adapted themselves to the weevil in Texas.

The fourth annual report of the Superintendent for the Suppression of the Gipsy and Brown-tailed Moth shows that there was expended a sum of over \$500,000 on an area of a little over 5000 square miles. In addition to this, the Federal government kept all trees and bushes free from the pest along 230 miles of roads. Parasites imported from Japan by Kincaid, and others obtained in Europe by Howard, have been liberated with satisfactory results, though it must be admitted that, in spite of all this work, the gipsy moth somewhat extended its range during the year, while the brown-tail became established throughout the eastern part of Massachusetts. A small colony of the brown-tail moth was reported from Rye, Conn., near the southwestern border of the State. Energetic measures for its suppression were taken, and it was thought that the entire colony was destroyed. Howard spent a portion of the year in Europe, in the interests of the Bureau of Entomology, and reports that while a very efficient inspection service is maintained in Holland, so that there is no danger that fruit trees imported from there will be infected, no such inspection exists in either France or England.

S. J. Hunter has published, as a Bulletin of the University of Kansas, a report on the "green bug," *Toxoptera graminum*, an aphid parasite of wheat. The report deals with the life, history and mode of distribution of the insect, and the best means of combating it. Its most important enemies are lady-bird beetles and lace-wing flies, whose larvae attack the aphids, and certain other insects whose larvae develop as internal parasites in the body of the aphid. Observations showed, also, that the aphids are able to tide over the interval between the reaping of one crop and the sowing of the next, by living on "volunteer" oats. Hence it follows that careful plowing under of these volunteer oats would destroy the food plant of the animal.

C. Gordon Hewitt has published Part 3 of his studies on the Bionomics of the House-fly in the *Quarterly Journal of Microscopical Science* for December. The paper gives systematic descriptions of flies commonly or often associated with the house-fly (*Musca domestica*), as well as with some points in the physiology of the latter. They develop more rapidly in horse manure than in other materials, though the reason for this difference is not known.

While more active at a higher than at a lower temperature, they are not killed by exposure for 12 hours to a temperature of -3° centigrade.

This and other papers published during the year call renewed attention to the part which the common house-fly ("typhoid-fly" is the name suggested by Howard) plays in the transmission of disease. A large amount of evidence has been accumulated to show that typhoid fever, cholera and tuberculosis are certainly carried by these insects. This is a mechanical mode of transmission, the germs being picked up by the fly in walking over infected materials, as in cesspools, latrines, etc., and subsequently deposited on human food when the insect lights upon it. In other cases the germs may apparently be taken into the alimentary canal of the fly with its food, pass uninjured through the canal, and be deposited with its excrement upon food products. The obvious remedy for all this is to prevent flies from breeding, by removing or screening manure heaps, cesspools, etc., and, by the use of screens, keeping them from lighting on food intended for human consumption. See INSECTS AND THE PROPAGATION OF DISEASES.

Recent experiments on the tsetse-fly indicate that if it be allowed to bite an infected animal, it will not transmit the disease at once, but only after a considerable interval of time, viz., 18 to 25 days. This would indicate that the fly is not a mere mechanical transmitter of the disease, but that a regular developmental cycle goes on in the body of the insect. In view of the importance which accurate information concerning all phases of the life cycle of this and other insects has upon the study of tropical diseases of man and other animals, and the relation between insects and economic plants, a special committee, to be known as the African Entomological Research Committee, was formed in England, with Lord Cromer as chairman. The committee hoped to coöperate with other similar organizations in securing a large amount of information on all phases of these questions, so far as they relate to the continent of Africa. For that purpose, they planned to send a trained entomologist to the East coast, and one to the West coast, to instruct official and other residents in the methods of collecting and observing noxious insects, and to stimulate, so far as possible, public interest in these subjects.

To avoid the confusion incident to the use of the same common name to apply to more than one species of the same genus, the American Association of Economic Entomologists have adopted a list of approved common names, giving with each the scientific name of the insect to which the common name may properly be given. The names approved at the 1908 meeting of the Association, and added to this list, appeared in the *Journal of Economic Entomology* for February, 1909.

EPILEPSY. During 1909 separate provision for epileptics was made in seven States. In other States there were private or semi-private charities, so that in all about 5000 epileptics are cared for in institutions especially designed for them. Many others are treated in homes for the insane or feeble-minded. New York State has established a second institution for these cases, and Ohio is considering one for the northern part of the State, to receive the overflow from the present

institution at Gallipolis. A general trend was observed in the direction of special care and carefully designed institutions or colonies for the treatment of epileptics. Littlejohn and Ohlmacher report a number of successful cases treated with calcium lactate. The treatment is based on the fact that in epileptics there is a condition of tardy blood coagulability, and that calcium lactate has the effect of hastening coagulability. In Ohlmacher's cases a patient's blood, which coagulated in 4 minutes, under the influence of calcium lactate coagulated in 1½ minutes. The improvement in the patient's condition apparently keeps pace with the decreased time of coagulation. The drug is administered in doses of 10 grains three times a day.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPISCOPAL CHURCH, REFORMED. See REFORMED EPISCOPAL CHURCH.

EPWORTH LEAGUE. An organization of the young people of the Methodist Episcopal Church, founded in 1892. It is the largest society of young people in the world, and in 1909 had a membership of 235,646. During the year 540 charters were issued to senior chapters, and 290 to junior chapters. The chief event of 1909 was the holding of the international convention at Seattle. The League has entered upon a new financial policy, the support of its administrative work being received from the local chapter by direction of the General Conference. Under this provision its revenues are larger than ever before, enabling it to carry out larger plans and more aggressive policies than have hitherto been practicable. The officers in 1909 were: President, Bishop W. A. Quayle; Vice-President, Rev. Franklin Hamilton, D. D.; General Secretary, Rev. Edwin Randall, D. D.; Treasurer, Rev. Paul C. Curnick, D. D.

ERBEN, HENRY. A rear-admiral of the United States navy, retired, died October 23, 1909. He was born in New York City in 1832, and was appointed a midshipman in the navy in 1848. He was one of the earliest graduates of the United States Military Academy. While still a midshipman he sailed on board the old-fashioned frigate, *St. Lawrence*, on the complimentary mission of the United States to Great Britain on the occasion of the London Crystal Palace World's Fair in 1851. He served throughout the Civil War and was engaged in many important engagements, including the siege and bombardment of Fort Pillow, where he commanded the ironclad *St. Louis*. He assisted also in the capture of Memphis, and in June, 1862, was on Admiral Farragut's staff. In 1865 he was assigned to duty at the Brooklyn Navy Yard. He commanded many vessels, and on his promotion to the grade of rear-admiral was given command of the first American squadron seen for many years in British waters. He was retired before the Spanish-American War, but voluntarily returned to the service. Admiral Erben was a notable type of the old "sea dog" and was one of the most popular and well-known officers of the service.

ERHARDT, JOEL BENEDICT. An American lawyer and public official, died September 8, 1909. He was born in Pottstown, Pa., in 1838. He graduated from the University of Vermont, and taught school for a short time. He enlisted in the Seventh Regiment for the Civil

War, and on the expiration of his term re-enlisted in the First Vermont Cavalry. He served until 1863, when he was made provost marshal of the Fourth District of New York City. He took a prominent part in the suppression of the Draft Riots of that city. At the close of the war he was appointed Assistant District Attorney for New York, and in 1876 was made Police Commissioner. In 1889 he was appointed Collector of the Port of New York. He reorganized and rebuilt the New York and Northern Railroad, of which he was receiver, and became its president in 1886. He had varied business interests, and at the time of his death was president of the Lawyers' Surety Co.

ERITREA. An Italian colony on the African coast of the Red Sea. Area, estimated at nearly 90,000 square miles. Estimated population (1906), 450,000, mainly nomadic. Of the 3949 Europeans (including the military) 2333 were Italians. Asmara is the capital and Massawah (2275 inhabitants) is the chief port, with a good harbor. There is abundant pasture, and camels, oxen, sheep and goats, together with the products derived from them, are the main articles of trade. Irrigation is essential to the successful raising of crops, owing to extended summer droughts. The annual yield of the pearl fisheries is valued at 250,000 lire for pearls and 800,000 lire for mother-of-pearl. Gold is mined near Asmara. Salt is an important product, being the monetary currency of Southern Abyssinia. The imports and exports in 1907 amounted to 10,605,877 and 2,188,205 lire respectively. The principal articles of export in 1906 were valued as follows: Hides and skins, 862,000 lire; butter, 330,000; mother-of-pearl, 273,000; wax, 252,000; gum, 82,000. There are 48 miles of railway in operation and about 30 under construction. There are 381 miles of telegraph lines, and ten post-offices. In 1907 the shipping entered at Massawah aggregated 145,120 tons. The estimated revenue and expenditure in 1908-9 for the Colony of Eritrea (not including Italian Somaliland) balanced at 8,169,960 lire (state subvention, 5,622,960; colonial revenue, 2,547,000; military expenditure, 4,207,500; civil administration, 3,962,460). The Governor is Marquis Giuseppe Salvago Raggi. The Dahlak Archipelago (one of the important pearl fisheries) belongs to Eritrea.

ESTES, DANA. An American publisher, died June 16, 1909. He was born in Gorham, Me., in 1840. He was educated in the public schools, and after several years of clerkship in various business houses he enlisted in the Federal army in 1861, but was disabled from further service by wounds received at the second battle of Bull Run. He became a member of the publishing firm of Degen, Estes & Co. Subsequently he was with the firm of Lee and Shepard, and in 1872 became a partner in the firm of Estes and Lauriat, which was succeeded in 1898 by the firm of Dana Estes & Co. Mr. Estes was a traveler and archaeologist. He was the first American to penetrate the Nile country to Uganda and the Congo State. He organized and was the first secretary of the International Copyright Association.

ETHICAL CULTURE, SOCIETIES FOR. A system of societies formed in New York City in 1876, by Felix Adler. His object was to provide a centre for persons who had lost attach-

ment for traditional creeds and desired to aid in promulgating the moral development of the individual and of society. The societies engaged in various forms of activity, beginning such work as district nursing and making education a special concern. An ethical culture school was established in 1878 as the first free kindergarten in the State. The membership of the New York Society in 1909 was 1254, including 100 non-resident members. This does not include affiliated societies in neighboring cities, as in Philadelphia, Chicago, and St. Louis. There are branches of the society in England and on the continent of Europe, as well as in Japan, New Zealand and other countries. These societies are federated in the American Ethical Union, which conducts a summer school of ethics. This Union is in turn related to the International Ethical Union, which, at a congress at Eisenbach, Germany, in 1906, adopted as its basis this declaration: "The general aim of the Union is: To assert the supreme importance of the ethical factor in all the relations of life, personal, social, national and international, apart from all theological and metaphysical considerations. The Ethical Union does not wish to be understood as promulgating any special religion based on a particular belief, and regards ethical religion as the necessary crown of religious thought. The societies for ethical culture hold regular Sunday meetings and Sabbath and day schools. The New York Society also maintains a country recreation centre at Cedar Lake, N. J. Among its other activities are the Women's Conference, the Young Women's Union, the Young Men's Union, the Hudson Guild, and the Down-town Ethical Society. A new meeting house for the society in course of construction. The officers in 1909 were: Felix Adler, Leader; John Lovejoy Elliott, Percival Chubb, Leslie Willis Sprague, David Saville Muzzey, Henry Moskowitz and Alfred W. Martin, Associate Leaders.

ETHNOLOGY. See ANTHROPOLOGY.

EUGENICS. See SOCIOLOGY.

EVANGELICAL ALLIANCE FOR THE UNITED STATES. A religious organization founded in 1867. Its object is to manifest and strengthen Christian unity and defend and promote Christian liberty, and to encourage coöperation in Christian work without interfering with the internal affairs of the denominations. The Alliance has defended and promoted religious liberty in countries where religious persecution was severe and persistent and has prompted the observance of an annual week of prayer in all Christian lands and in all mission fields during the week beginning with the first Sunday of the year. The Alliance is undenominational and all the evangelical bodies are represented in its Board of Directors. The activity of the Alliance during 1909 was chiefly in preparing and publishing the Programme for the Week of United and Universal Prayer and sending it to 20,000 churches; and the pleading of the cause of the Armenians of Asia Minor in view of the terrible massacres of Armenians at Adana in April. The Department of State was memorialized and word was sent abroad urging an identical note of warning from the signatories of the Berlin Treaty. The president of the Alliance is Dr. Leander T. Chamberlain.

EVANGELICAL ASSOCIATION. A religious denomination, founded in 1800 by Jacob Albright among the Germans in Pennsylvania. The church polity of the Association is essen-

tially Methodist. It is represented in the United States and Canada, in Germany, and Switzerland. In 1909 there were 134,695 members and 1875 church edifices, with 12 itinerants and 420 local preachers. In the 270 Sunday schools were 169,080 scholars. The total contributions of the church for all purposes during the year was \$1,641,421. Domestic missions received attention and foreign missions are carried on in Japan. The church maintains a Biblical Institute, a college at Napier, Ill., and a publishing house at Cleveland, O. An important organization connected with it is the Young People's Alliance, which has a membership of over 40,000. The Association publishes several periodicals, the most important of which is the *Evangelical Messenger*, published in Cleveland, O. It has other publications in England and Germany. The church has three bishops. The publishing house and denominational headquarters are at Cleveland, O.

EVANS, GEORGE ESSEX. An Australian poet, died December, 1909. He was born in London in 1863. In 1881 he went to Australia and was for some time District Registrar at Toowoomba. For twenty years he contributed to the Australian press and occasionally to the English press. His first book of poems was published in 1891. It was entitled *The Repentance of Magdalene Despar*. In 1898 he published *Lorraine*, a long narrative poem of life on a sheep run in Australia. Several other volumes of his verse were published. He founded in 1903 the Austral Association for the advancement of music, art, literature and science. For several years he edited the *Antipodean*, and founded *The Rag* in 1904.

EVEREST, MOUNT. See EXPLORATION.
EVOLUTION. See BIOLOGY.

EXCHANGES. On December 14, 1908, Governor Hughes of New York appointed a committee, consisting of Horace White, chairman, and eight other prominent citizens in various walks of life, to inquire "what changes, if any, are advisable in the laws of the State bearing upon speculation in securities and commodities, or relating to the protection of investors, or with regard to the instrumentalities and organizations used in dealings in securities and commodities which are subject to speculation." This committee, paying its own expenses, made an intimate investigation of exchanges in New York City, took the testimony of those engaged in speculation and others qualified, and examined American and foreign legislation and experience in the regulation of speculative exchanges. Its report was submitted in June. This report defined speculation as "forecasting changes of value and buying or selling in order to take advantage of them." It pointed out the advantages of the exchanges in steadyng prices and in enabling merchants and manufacturers virtually to insure themselves against fluctuations in the prices of those commodities upon which their business depends. After pointing out the distinction between speculation carried on by experienced and qualified operators and that indulged in by the inexperienced, the report stated that the difficulty in rooting out that which is economically and morally destructive lay "in the practical impossibility of distinguishing what is virtually gambling from legitimate speculation." The committee, however, felt that the most advantageous procedure would be the adoption of measures reducing speculation by persons

unqualified for it. The report then proceeded to analyze the business of the Stock Exchange, with reference to kinds of patrons, character of transactions, margin trading, pyramiding, short-selling, manipulation of prices, "wash sales" and "matched orders," corners, failures of brokers, desirability of the examination of the books of brokers by public authority, listed and unlisted securities, fictitious trades, the unit of trading, and the desirability of requiring the Stock Exchange to incorporate under the State laws. The committee advised against the examination of brokers' books by public authority, believing that examination under the direction of the governors of the exchange would be sufficient. A majority likewise advised against incorporation for similar reasons.

The Consolidated Exchange and the curb market were also considered. With reference to the latter the report pointed out that great evils result from its unorganized status. About 85 per cent. of the business of the curb comes through members of the Stock Exchange, and in this fact the committee finds a basis for the introduction of regulations governing the methods of dealing on the curb and the admission of securities to quotation thereon. By refusal of the regular Stock Exchange members to continue intercourse if desired regulations were not complied with, the curb business could be brought to a sounder basis. With reference to fraudulent financial advertisements in the press and by means of circulars, the committee recommended most stringent legislation. It also recommended amendments to the law, in effect September, 1908, making the keeping of a bucket-shop a felony, so as greatly to increase the penalty for a second offense.

The Produce, Cotton, and Coffee; the Fruit, and the Hay; the Mercantile, dealing with dairy and poultry products, and the Metal Exchanges were all investigated. The committee condemned the recently introduced trading in mining stocks on the Produce Exchange. The function of the Cotton Exchange in relieving cotton manufacturers from the necessity of becoming speculators in cotton themselves was duly praised, but the inordinate speculation that at times occurs was condemned. The committee recommends simply that the officers of the Exchange discipline members engaging in such practices. With reference to the Mercantile and Metal Exchanges the committee found that price quotations were emanating from both which were not the result of actual dealings, but artificial estimates by quotation committees. On this account the investigators recommended that the charters of both be repealed.

The report closes with a résumé of the German experience, showing that stringent legislation against Berlin exchanges in 1896 proved disastrous and led to a modification of the law in 1908 with a view to regaining business and capital driven abroad. The prohibition of short-selling, which is still retained by the German law, augments price fluctuations.

Herbert Knox Smith, Commissioner of Corporations, in December issued the final sections of a report on the methods of trading upon the New York and New Orleans Cotton Exchanges. Earlier sections were issued in 1908. The report recognizes the value of such great central markets, but condemns the methods of dealing in futures in vogue. The parts of the report issued in 1908 condemned the "fixed-difference" system of the New York Cotton Exchange,

whereby the relative values of different grades of cotton are arbitrarily determined for as much as a year in advance. No alteration of its methods was made by the New York Exchange following that report, though a committee was appointed to make investigation, and these later sections of the report therefore are severe in their condemnation of the artificial quotations, and especially of the fictitious future prices, resulting from the system practiced. The report states that the early sections led to action by the New Orleans Exchange with a view to correcting abuses.

EXPERIMENT STATIONS, AGRICULTURAL. See AGRICULTURAL EXPERIMENT STATIONS.

EXPLORATION. The largest phases of geographical field work during the year were in the polar regions (see POLAR RESEARCH). In other parts of the world there was great exploratory activity, but nearly all of it was devoted to comparatively small areas. Now that most of the land surfaces are fairly well known, a new kind of exploration has come in. It consists of the minute and more scientific study of regions most of which have already been revealed in their general characteristics. This work is now widely carried on by the agents of governments, of scientific societies and of railroad and industrial companies. Exact knowledge of many regions is thus being rapidly accumulated.

In Canada, for example, the explorers of the Interior Department now report that the coal fields of Alberta are, by far, the most extensive in the Dominion, and the new map shows that they cover a large part of the province, over 20,000 square miles of the beds being regarded as workable, while the coal measures over an equally large area may yet be found to have considerable value. The Canadian Northern and Grand Trunk Pacific railroads have now entered these coal fields on their way to the Pacific.

The north shore of the Gulf of St. Lawrence was long supposed to be almost worthless, but this view has been greatly modified by the recently completed studies of the region, whose timber resources are large, while the falls and rapids in many of the rivers supply enormous water power that will some day be harnessed.

The Northeast Peninsula of Labrador, at the entrance to Hudson Strait, is now being explored by the government of Newfoundland. The results of the studies and surveys of the past season have not yet been published. The mountains of this region have been seen from the decks of thousands of fishing and other craft, but, except along the coast, few facts about the country were known until Bernard Hantzsch published a paper in Germany, last year, on his biological studies in that region in 1906. Mr. A. H. Garrison, having returned from his explorations in the Canadian Arctic, has published his map of the larger part of the delta of the Mackenzie River, the best map of the delta channels yet produced. Mr. V. Steffansson, who is continuing his ethnological work among the Eskimos of northern Alaska and Canada, reports that the charts of the northern coast of the continent, between the Mackenzie River and Point Barrow, are so poor that, many times, they are an impediment instead of a help to navigators.

Peru was more active than any other South American country in the promotion of discovery. A number of government expeditions were engaged in the exploration of drainage basins to the east of the Andean ranges and especially

in mapping the courses and the navigability of a number of tributaries of the large rivers. Thus the entire upper part of the Rio Madre de Dios system is being gradually revealed. Peru, Chile and Brazil produced practically all the governmental maps giving results of recent exploratory work. Chile is giving special attention to surveys of mining areas and these map sheets, together with the railroads' surveys, are supplying material for the better mapping of the republic. The topographic survey of the state of São Paulo, Brazil, is steadily advancing and its map sheets are comparable with the best work of the kind. Private railroad and navigation companies having concessions in Bolivia, Brazil and other republics are finding it necessary in many cases to make their own surveys and maps and their contributions are becoming a part of the best material available for the growth of our knowledge of this still poorly mapped continent. After Miss Annie Peck ascended Mount Huascarán, Peru, in 1908, she expressed the view that one of its two summits was over 23,000 feet high, and accordingly the highest known summit of the Western World, as the triangulation results of Schrader gave Aconcagua only 22,812 feet. Mrs. Fanny Bullock Workman, who holds the woman's record for high ascents, thereupon sent from France three topographers, who, after establishing the heights above sea level of four stations in the neighborhood of Huascarán, triangulated from each of them the two peaks of the mountain, with these results: Height of north peak, 21,812 feet; south peak, 22,187. Aconcagua continues to hold its supremacy among American summits.

Commander d'Ollone has returned to France at the end of his successful archaeological and geographical labors in western China and eastern Tibet. He avoided the routes of other explorers and confined his attention to some of the least known districts. His narrative and map have not yet been published, but it is known that they will throw more light on the remarkable bend of the Ya-Hoang-ho in Tibet and reveal a new district that differs much from the more typical parts of the Tibetan plateau. It stands at an altitude of 13,000 feet and is a plain traversed by low mountain swells that are covered with grass and everywhere passable by horses. The people are pastoral and live on horseback. The Comte de Lesdain has published an account of the longest journey that a European traveler, accompanied by his wife, has yet made through the lesser known parts of Asia. It extended from Peking through Mongolia and Tibet to India and the traveler was able to throw a little new light on the geography of the Ordos and Ala-shan regions of Asia. The Geological Survey of India announced a new determination of the height of Mount Everest, the highest mountain in the world. The elevation now assigned is 29,141 feet, which is the mean value of six trigonometrical determinations all made at stations nearer to the mountain than those upon which depended the height of 29,002 feet that had been the accepted elevation since 1850. The Survey reports that the height, 29,141 feet, is still probably too small, as it is not yet possible to eliminate all sources of error in these determinations; also that Mount Godwin Austen (K2), 28,250, is the second highest known mountain; the highest peak of Kinchinjunga, 28,146 third. All of them are in the Himalayas. The Duke of the Abruzzi endeavored in May to reach the top of Mount Godwin Austen, but was

compelled, at a little over 19,000 feet, to give up the attempt. About a month was spent in topographic surveying near the mountain. While mountaineering in the Karakoram or western part of the Himalayas, last summer, Dr. T. G. Longstaff made the first crossing of the Saltoro Pass, 18,200 feet, and from it he saw the Siachen glacier, which he explored and found to be 44 miles long instead of 20, as has been supposed. It is therefore the longest glacier in the Himalayan system and probably the largest outside of Alaska and the polar regions. His most interesting discovery was a group of very lofty peaks, forming a new chain of the Karakoram and culminating in Teram Kangri, 27,610 feet. Mr. William E. Geil, of Doylestown, Pa., produced his book describing his journey of the previous year along the entire extent of the Great Wall of China. Many of his photographs give wholly new views of the Wall. The record of Major H. R. Davies' four journeys in Yunnan to study the feasibility of a railroad between India and the Yangtse River has proved to be the best contribution yet made to our knowledge of this great western province of China. More than half of the regions he visited had never been explored by white men. Mr. G. W. Bury, supported by the Royal Geographical Society, entered South Arabia, near Aden, in the spring to explore a part of the vast unknown region, but his purpose was defeated by the treachery of the inland Arabs and his party barely escaped to the coast with their lives.

Mount Cameroon, the highest summit of West Africa, was, till recently, supposed to be an extinct volcano. It gave some evidence, however, in 1908 that its fires were not quite extinguished and, on April 26, last year, it burst into violent eruption and continued in a state of great activity for some weeks. It happened that Lieutenant Boyd Alexander, the African explorer, was camping on the mountain slope at the time. He has written the only account of the event. Severe earthquakes accompanied the eruptions and over 100 shocks were felt in one night. Lava streams, descending the mountain, destroyed all the timber in their way, terrific explosions occurred, fragments of rock were thrown high into the air and the sky was red with the reflection from the molten lava in the two burning craters. An unusual incident was the screams and frenzied antics of troops of terrified monkeys. The German settlements and plantations on the lower slopes were not injured. All over those parts of tropical Africa where the whites are establishing their enterprises there is now great scientific activity, of which the work done by the French in Dahomey is a good example. They have just completed two years' investigations which give a good idea of the geological formations, mineral resources, geography and climate of Dahomey, and have studied the influence which these physical phenomena have exerted in the distribution of the human inhabitants and of the most important varieties of vegetation. The Belgian Colony of the Congo is continuing the building of railroads around the short stretches of rapids in the Upper Congo and when the work is completed, there will be steam transportation, by rail and river, for 2500 miles up the Congo. A branch of the Cape to Cairo Railroad (q. v.) has been extended into Katanga, the southeast province of the Belgian Congo, whose resources in copper are believed to be among the largest in the world. Another railroad, now completed for about 100 miles west

of Benguela, is intended to give the Katanga mineral field an outlet to the Atlantic.

The Dutch are now very active in the exploration of their part of New Guinea, which, for years, has been the least known portion of the island. Military detachments have been surveying various rivers, especially those which debouch on the south coast; and two Dutch societies have sent out an expedition headed by H. A. Lorentz to study the interior of their colony in the region of the snowy range that traverses it. The boundary between German and British New Guinea was delimited during the year and a joint German-Dutch Commission has been sent out for the demarcation of the boundary between their colonies.

EXPLOSIVES. See CHEMISTRY, INDUSTRIAL.

EXPOSITIONS. During the year there was held in the United States the Alaska-Yukon-Pacific Exposition in Seattle (see below), and in Quito, Ecuador (see below), the National Ecuadorian Exposition.

The Argentine Republic will commemorate the first centenary of its existence by an international exhibition of agriculture and of railway and land transport, in Buenos Ayres, from May 25 to November 25, 1910. All of the South American governments and many of those of Europe have promised to send exhibits. The site selected will cover an area of 180,000 square metres and the buildings now in course of erection, as shown by the published plans, are dignified and worthy of the event. A Railway Congress will be held simultaneously with the Exhibition. A Universal and International Exposition will be held in Brussels, Belgium, for six months, beginning in April. A site of 200,000 acres has been chosen and it is expected that at least \$5,000,000 will be spent in the installation of this Exposition. Most of the European governments and many of those of Central and South America have taken space or built special pavilions. An American Exposition will be held in Berlin during June, July, and August, 1910, for the purpose of presenting an exhibition of the industrial achievements, the natural resources, and the progress of the United States along artistic and intellectual lines. Prince Henry of Prussia is honorary president of the German Commission, and J. Pierpont Morgan holds a similar relation to the American Commission. Expositions to be held in Turin and in Rome, Italy, are announced for 1911.

ALASKA - YUKON - PACIFIC EXPOSITION. This was held on Union Bay of Lake Washington in the city limits of Seattle, Washington, from June 1 to October 16, 1909.

ORIGIN. The exhibition of products from Alaska at the Lewis and Clark Exposition, held in Portland, Oregon, in 1905, was so inadequate that the collector appointed by Governor Brady to receive exhibits, finding that nothing of a representative nature could be assembled in the time at his disposal, and believing that an exhibition of a superior character could be held, wrote to the secretary of the Alaska Club in Seattle urging that "an Alaska Fair be held in Seattle in 1907." The local newspapers were quick to recognize the commercial value of such an undertaking and in August, 1905, the Alaska Club provided Godfrey Chealander with funds and transportation to visit Alaska for the purpose of interesting the Northern people in such a proposition. After his return, in

March, 1906, a meeting of fifty representative business men of Seattle was held and it was decided to hold an Alaska-Yukon Fair. On May 8, 1906, articles of incorporation of an Exposition Company with a capital stock of \$500,000 were filed and on August 17 amended articles inserting the word *Pacific* were placed on record. The object of the Exposition was given as "the exploitation of Alaskan resources and those of the countries bordering on the Pacific Ocean."

ADMINISTRATION. Originally the officers of the corporation were: J. E. Chilberg, President; John H. McGraw, Vice-President; R. A. Ballinger, Vice-President; A. S. Kerry, Vice-President; W. M. Sheffield, Secretary; C. R. Collins, Treasurer; and I. A. Nadeau, Director-General. Subsequently, Mr. Ballinger resigned as one of the vice-presidents, and Mr. H. C. Henry was chosen to fill his place. The other officers were: John W. Roberts, General Counsel; Frank P. Allen, Jr., Director of Works; Henry E. Dosch, Director of Exhibits; James A. Wood, Director of Exploitation; G. E. Mattox, Director of Concessions; Dr. E. M. Rininger, Medical Director; F. N. Innes, Musical Director; Louis W. Buckley, Director of Special Events; G. L. Berg, Director of Fine Arts; Welford Beaton, Chief of Publicity; A. D. Barrall, Chief of Admissions; James Frederick Dawson, Landscape Architect; and C. W. Wappenstein, Chief of Police.

FINANCES. On October 1, 1906, the stock of the Exposition Company, amounting to \$500,000, was placed on sale and the entire issue was taken at once. On December 28 supplemental articles of incorporation were filed increasing the capital stock from \$500,000 to \$800,000 and the additional shares were promptly disposed of. Two years later bonds amounting to \$350,000 were sold within two days after being placed on the market. The State Legislature of Washington authorized a contribution of \$1,000,000, and the appropriation by the National government for its exhibits was \$600,000. Among the various States, California and Oregon each raised \$100,000; New York \$75,000; and Missouri, Idaho, Utah, and other States less amounts. The complete Exposition involved an expenditure of approximately \$10,000,000.

LOCATION. The site chosen was a portion of the campus of the State University of Washington, and consisted of a narrow peninsula between Lake Washington on the east and Lake Union on the west. The two lakes were connected by the Lake Washington ship canal. The grounds, covering about 250 acres, sloped gradually down to the water's edge. The main entrance to the Exposition was within twenty minutes' ride from the centre of the city by electric street car railways, and was reached by five different lines. The laying out of the grounds was under the direction of John C. Olmsted, of Brookline, Mass., and brilliant flowers, prominent among which was the cactus dahlia, the official flower of the Exposition, formed a most conspicuous feature of the scheme.

BUILDINGS AND GROUNDS. In the general plan of architecture, the style followed was the French Renaissance. The principal buildings were grouped on either side of a terraced court at the summit of which was the United States Government Building with its great dome 270 feet high, that at night was brilliant with electric lights. On the west, in descending

order, were the four buildings devoted to the exhibits of Alaska, Europe, Agriculture, and Mining, while similarly on the east side were those containing the exhibits of the Philippines and Hawaii, Oriental Countries, Manufactures, and King County. Beyond, to the west, was the Fine Arts Building and the Auditorium, while on the east was the Forestry Building and the two large State buildings of California and New York. The lower end of the Court was open, giving a view in the distance of Mount Rainier with its cap of perpetual snow, the highest peak in the United States. In the immediate foreground of the lower opening of the Court were the formal gardens of the Exposition, to which the name of Vista Gardens was given. In the centre of the Court was a circular basin or lake, 200 feet in diameter, from which a gigantic geyser played 150 feet in the air. Seven of the Exposition buildings, the Fine Arts, Auditorium, Machinery Hall, Forestry, Washington State, Arctic Brotherhood, and Woman's Building, are permanent structures, and at the close of the Exposition became the property of the University of Washington. The first three are of brick and steel. The Fine Arts Building, which is in the Roman Classic style, is to be the permanent chemistry building, and the Auditorium will be used for university public gatherings. It has seating capacity for 2500 persons. The front façade consists of a Corinthian colonnade, which makes the dimensions of 180 by 150 feet appear smaller than they really are. Machinery Hall, used by the engineering department of the University, is also of permanent brick and steel construction. The Arctic Brotherhood Building is built of logs and is typical of the homes in Alaska. It will be used as a museum of natural history. The Forestry Building, one of the largest log-houses ever built, became the forestry department of the University at the close of the Exposition.

In the plaza in front of the Government Building stood the Exposition monument. It was 80 feet in height, and was entirely coated with gold from Alaska and Yukon. About \$7000 worth of gold dust was used to gild it. At the base were four figures emblematic of the Northland, the South Pacific countries, the Pacific Coast, and the South Seas. The column was Corinthian with an astronomical globe showing the signs of the zodiac, and surmounted with the American eagle. On Flag Day, June 14, Lorado Taft's bronze statue of George Washington was unveiled. A statue of William H. Seward commemorating his share in the Alaska purchase is one of the permanent memorials of the Exposition.

AMUSEMENT FEATURES. These were collected on the west side of the grounds, along an avenue about three-fourths of a mile long, to which the name of "Pay Streak" was given. In addition to the usual entertainments, a special feature was the large number of ethnological shows, such as Chinese Theatre, Eskimo Village, Fair Japan, Igorrote Village, Spanish Theatre, etc.

HISTORY AND RESULTS. On June 1, 1907, the ground was broken with suitable ceremonies, including an address by the Hon. John Barrett, who was the representative of President Roosevelt. In accordance with the promise that Seattle would produce "the fair that will be ready," two years later, on June 1, President

Taft pressed a telegraph key of Alaskan gold that inaugurated an Exposition that was essentially complete. At midnight on October 16 the fair closed with every debt paid and enough surplus on hand to meet the expense of wrecking the buildings and clearing the grounds. The total attendance was 3,740,561 persons.

ECUADORAN EXPOSITION, NATIONAL. The centenary of the independence of Ecuador was celebrated by an international exposition held in Quito from August 10 to December 31. The site of the Exposition was about a mile from the centre of the city. Besides the main building, erected by the government, there were pavilions built by the governments of Chile, Colombia, Italy, and France. The United States building was a reproduction on a small scale of the White House in Washington. The Director-General was Juan Francisco Game, and the representative of the United States, Ernest H. Wands. A special issue of commemorative stamps was placed in circulation on August 9 to run until December 31, 1909.

FAILURES. See **FINANCIAL REVIEW**, paragraph *Failures*.

FALKLAND ISLANDS. A group of islands in the South Atlantic, constituting a British Crown colony. Area (East Falkland, 3000; West Falkland, 2300; 100 small islands, 1200), 6500 square miles, besides the dependency of South Georgia, 1000 square miles. Other dependencies are the Scotch Shetlands, South Orkneys, the Sandwich group, and Graham's Land. Population (estimated 1907), 2266, exclusive of the whaling settlement in South Georgia. Capital, Stanley, on East Falkland, with 800 inhabitants. Education is compulsory, and there are government and parochial schools. There are 2,325,154 acres under pasture, and sheep-raising is the chief industry. There were (1907), 695,747 sheep, 4500 cattle, and 3000 horses. Total imports (1908), £73,062; exports (wool £105,495), £189,506. Total tonnage entered (1908), 281,351. The revenue and expenditure in 1908 were £17,775 and £19,767 respectively. The Governor (William Lamond Allardyce) is aided by an executive council and a legislative council, all of whose members are nominated by the Crown.

FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA. An organization formed as a result of the meeting of 500 officially appointed delegates of 30 religious denominations, held in New York City in November, 1905. These delegates recommended a plan of federation, which was adopted by the official action of the National Conference of Churches, representing an aggregate membership of about 15,000,000. The objects of the Council are, first, to express the fellowship and catholic unity of the Christian Church; second, to bring the Christian bodies of America into united service; third, to encourage devotional fellowship and mutual counsel concerning the spiritual life and religious activity

Courtesy of "Engineering Magazine"

THE ALASKA-YUKON-PACIFIC EXPOSITION AT SEATTLE—GENERAL VIEW

of the churches; fourth, to secure a larger combined influence for the churches of Christ in all matters affecting the moral and social conditions of the people so as to promote the application of the law of Christ in every relation of human life; fifth, to assist in the organization of local branches of the Council and to promote its aims in their committees.

The following Christian churches are represented in the Christian Council; Baptist Church (North), Free Baptist Church, Negro Baptist Church, Christian Connection, Congregational Church, Disciples of Christ, Evangelical Association, Evangelical Synod, Friends, Evangelical Lutheran Church, General Synod, Methodist Episcopal Church, Methodist Episcopal Church (South), Primitive Methodist Church, Colored Methodist Episcopal Church of America, Methodist Protestant Church, African Methodist Episcopal Church, African Methodist Episcopal Zion Church, Mennonite Church, Moravian Church, Presbyterian Church in the U. S. A., Cumberland Presbyterian Church, Welsh Presbyterian Church, Reformed Presbyterian Church, United Presbyterian Church, Protestant Episcopal Church, Reformed Church in America, Reformed Church in the U. S. A., Reformed Episcopal Church, Seventh Day Baptist Churches, United Brethren in Christ, United Evangelical Church.

The Council is to meet every four years. Its first regular meeting was held in December, 1908. Between its meetings its work is carried on by a proportionately representative executive committee and certain subordinate committees or commissions with definite duties. The Executive Committee met in Louisville, Ky., in December, 1909. At the general meeting in 1908 several remarkable resolutions on industrial and social questions were adopted by the Council and a Commission on Church and Social Service was formed. At the meeting of the executive committee in Louisville this commission was clothed with power to draw upon the resources of the churches for its work. The president of the Council is Bishop E. R. Hendricks, of the Methodist Episcopal Church (South). The officers of the Executive Committee of the Council are: Chairman, W. H. Roberts, D. D.; Secretary, E. B. Sanford, D. D. The churches represented in the Council number over 30,000,000 communicants.

FENCING. The sixteenth annual intercollegiate tournament was again won by the United States Military Academy, the final score being: West Point won 29, lost 4; United States Naval Academy won 21, lost 12; Yale won 16, lost 17, and Massachusetts Institute of Technology won 9, lost 24. Pennsylvania, Columbia, Princeton and Cornell all failed to reach the finals. In dual matches, West Point defeated Harvard 7 to 2, Yale 6 to 3 and Pennsylvania 8 to 1. United States Naval Academy defeated Yale 5 to 4, and Cornell 5 to 4. Pennsylvania defeated Princeton 5 to 4, and United States Naval Academy 5 to 4, and was defeated by Cornell 7 to 2. At the national championships the dueling swords were won by A. Delapore of the Fencers' Club of New York, the foils by O. A. Dickinson of the United States Military Academy and the sabres by A. E. Sauer of the I. A.

C. The Saltus cup and medals were won by the Turn Verein, the team comprising John Allaire, George Reimherr and Paul Benzenberg.

FENN, GEORGE MANVILLE. An English author, died August 27, 1909. He was born at Westminster, England, in 1831. He began his career as a tutor, but soon left teaching to engage in journalism. He contributed to many magazines and was at one time editor of *Castell's Magazine*, and afterwards editor and proprietor of *Once a Week*. He is best known, however, as a writer of books and stories for boys. He wrote over 100 books and 1000 short stories and magazine sketches. Among his best known books are *Nic Revel* (1898); *Draw Swords* (1898); *The King of the Beach* (1899); *Blind Policy* (1905); and *Aynsley's Case* (1906).

FERRER Y GUARDIA, FRANCISCO. A Spanish educator and anarchist, executed October 13, 1909, for complicity in rioting in Barcelona, Spain, in the summer of 1909. He was born at Abella in the province of Barcelona in 1859. His father was the owner of a small fruit farm and Ferrer received the training of the average Spanish peasant. He early showed radical tendencies and at the age of 14 he was obliged to leave his native town on account of having committed the sacrilege of drinking by stealth the wine reserved for sacerdotal use. He secured a clerkship in the railway service and was rapidly promoted to the post of inspector. His radicalism, which now included republicanism, involved him in an insurrection led by General Villacampa, and at the age of 26 Ferrer was an exile in Paris. At this period his ability as a teacher first disclosed itself. He subsisted partly by the sale of wine on a commission basis and partly from a small stipend received as secretary for the Spanish patriot, Zorilla. He devoted all his leisure time to study, especially of the sciences, of morals as distinguished from supernatural religion, and of the sovereignty of the individual in opposition to the institutional and family life. He also gave a course of popular lectures and taught in a night school organized under anti-clerical auspices. Ferrer devoted himself more and more to the philosophy of free thought and anarchy, undertaking the translation into Spanish of many atheistic historians and philosophers. He was left a legacy of about \$200,000, and fifteen years after he had left Spain he returned to Barcelona, where his memory as a former Revolutionary had apparently been forgotten. He set up and equipped a press for the dissemination of the philosophy of the leaders of French anti-clericalism and established at Barcelona the "Modern School." His success as an educator was remarkable, largely because of his magnetic personality. Through his printing press in the meantime he turned out many editions of the world's leading anarchist pamphlets for circulation among the wage-earners of Barcelona, and through its graduates the "Modern School" made itself conspicuous among the trades unions on the subject of the iniquity of the government and the need of a social revolution. The press and the school were frequently raided by the police, but Ferrer was on each occasion absent. He was always conspicuous at free-thought conferences, anarchist gatherings and assemblages of "advanced" thinkers. In 1906 he was arrested on the charge of complicity with

Manuel Morales in an attempt on the life of King Alfonso at the time of his marriage with Princess Ena, but on this charge he was acquitted. He was arrested on September 1, 1909, by the Spanish government on the charge of being a noted anarchist and of being chiefly responsible for the uprising in Barcelona. After a trial he was declared guilty and was executed. For the result of this action of the Spanish government, see the article SPAIN, paragraphs on *History*. Ferrer had little originality, but he is said to have been one of the most remarkable teachers of his generation. He had the faculty of digesting masses of technical details and of accumulated evidence, and of formulating them lucidly for the benefit of even the lower types of intelligence.

FERTILIZERS. There was marked progress throughout the world during 1909 in the production and consumption of fertilizers. This may be ascribed to the gradual extension of the use of improved and more intensive systems and methods of farming, stimulated by an era of high prices for farm products and the rapid exhaustion of the supply and of the native fertility of the rich virgin soils. Under the influence of this incentive the use of commercial fertilizers was extended to regions where formerly they were used to only limited extent or not at all, as, for example, Australia, Japan, China, Manchuria, South Africa, and the West Indies.

Exact and detailed statistics of fertilizer production and consumption in 1909 are not available, but such data as are at hand indicate substantial growth in all directions. Statistics compiled by the United States Department of Commerce and Labor show that production has not kept pace with consumption in the United States in recent years. The imports of fertilizers and materials largely used in the manufacture of fertilizers in 1908 were valued at over \$12,000,000. In addition over \$12,000,000 worth of Chilean nitrate was imported. Fertilizers to the value of nearly \$11,000,000 were exported to other countries. It is estimated that the balance of trade in fertilizers is at the present time against the United States to the extent of about \$17,000,000 annually.

Apparently there was a slight falling off in the American consumption of potash salts in 1908. Of an estimated total German production of 495,000 tons of actual potash, valued at \$26,000,000, the United States consumed 110,000 tons, Germany 272,500 tons. The increase in American consumption in 1909 is estimated at from 10 to 20 per cent. The German potash industry and the prices of potash were unsettled begun in 1897, after the crisis of 1893 had Potash Syndicate and the acquisition of certain of the German mines by a combination of American fertilizer interests. It is stated that the American companies secured their supply of potash for 1910 at 40 per cent. less cost than in previous years, and therefore the prospect for much lower prices for potash in fertilizers is good. There was a decided fall in the price of Chilean nitrate of soda, ascribed to increased production following the dissolution of the nitrate syndicate in March, 1909.

There was a marked revival of interest in the production and consumption of sulphate of ammonia as a fertilizer, especially in the United States. Attention was sharply drawn to the large amount of this material annually going to waste, particularly in this country, in the manu-

facture of gas and coke. Statistics were presented which indicate that in 1908 the United States consumed over 121,000 tons (of 2000 pounds) of sulphate of ammonia, producing something over 87,000 tons and importing the balance, mainly from England, which annually produces over 360,000 tons, closely followed by Germany with a production of 345,000 tons out of a total production for the whole world of 985,000 tons.

There was considerable activity in 1909 in the development of processes and their application in the manufacture of nitrogen compounds from the free nitrogen of the air and in the determination of their value as fertilizers. The annual production of Norwegian nitrate (basic lime nitrate) made by the Birkeland-Eyde process, and of calcium cyanamid made by the Frank and Caro and similar processes, is estimated at about 25,000 tons each. Factories for the manufacture of these products are now in operation at various places in Europe, where cheap water power is available, as well as at Niagara Falls, Canada.

Considerable attention was also given during the year to the question of the utilization of peat for agricultural purposes, and at least one efficient process (Wolterck's) for the manufacture of ammonia from moist peat was reported and tested with very satisfactory results. The direct use of peat as a fertilizer also received some attention. The conservation of the Peruvian guano deposits also claimed attention during the year, and steps were taken to protect the guano birds and to introduce a system of rotation in working the deposits which would conserve and increase the supply of this valuable fertilizer.

The sources of supply of fertilizing materials were increased during the year by the discovery and exploitation of a number of new phosphate deposits in different parts of the world, including Australia, New Zealand, South Sea Islands, South Africa, Algeria, Tunis, and the West Indies. Further examination of the phosphate deposits in the area of Wyoming, Utah, and Idaho, withdrawn from settlement by executive order in 1908, indicate a visible supply of at least 1,400,000,000 tons of phosphate. Various bills having as their object the opening up of these lands are now being considered by Congress. The world's consumption of phosphate in 1908 is estimated as about 5,500,000 tons, the larger part of which was converted into superphosphate, the production of which in 1908 was 7,500,000 tons.

A large part of the scientific investigation relating to fertilizers during 1909 dealt with the relative efficiency of different forms of phosphoric acid, potash and nitrogen. The investigations of C. G. Hopkins in this country showed that raw phosphates, finely ground, could be profitably used in connection with an abundance of humus-forming organic matter in improving certain classes of Illinois soils. On the other hand, the Association of German Agricultural Experiment Stations issued a statement strongly advising against the general use of raw phosphate. Much attention was given to a study of the relative fertilizing value of nitrate of soda, sulphate of ammonia, and the new nitrogen compounds made from the nitrogen of the air, as well as other nitrogenous fertilizers. As a result of repeated tests at the New Jersey Experiment Station with different crops it was reported that, taking the availability of the

nitrogen of nitrate of soda as 100, the relative availability of the nitrogen of sulphate of ammonia was 69.7, of dried blood 64.4 and of manure 42.7. European experiments indicate that the nitrogen of calcium cyanamide is about equal to that of sulphate of ammonia as a fertilizer, but that Norwegian nitrate (basic lime nitrate) is fully equal, and possibly in certain cases superior, to nitrate of soda. Experiments on the fertilizing value of potash in various silicates—feldspar, mica, green sand, lava meal, etc., showed as a rule a low efficiency. Experiments were reported showing a marked stimulating or fertilizing effect from the use of small amounts of manganese salts.

A notable contribution during the year to the literature of fertilizers was the book by A. D. Hall, director of the Rothamsted Experiment Station, on *Fertilizers and Manures*. There also appeared during the year a revised English edition by Sir William Crookes and J. Percival of George Ville's book on *Artificial Manures*, which has been declared by competent authority to be an unrivaled exposition of the principles underlying the use of artificial fertilizers.

FIJI ISLANDS. A group of islands in the Southern Pacific, constituting a British Crown colony. Area (Viti Levu, 4112 square miles; Vanua Levu, 2432 square miles), including 225 small islands, 7435 square miles. Capital, Suva, in Viti Levu. Population (1901), 120,124 (94,397 Fijians, 17,105 Indian immigrants, 2450 Europeans); estimated in 1907, 128,404. There are government and mission schools. The Roman Catholic and the Wesleyan missions maintain various institutions, religious and educational. Vegetation is luxuriant. Sugar-cane, tea, cotton, corn, tobacco, arrowroot, coconuts, and fruits are grown. There are six sugar-mills, with collective daily output of 420 tons. The imports and exports for three successive years were as follows: 1906, £609,496 and £603,410, respectively; 1907, £643,007 and £881,384; 1908, £662,654 and £878,393. Practically the entire trade is with British colonies (imports £646,029, exports £878,112, in 1908). Total tonnage entered and cleared in 1907, 455,229. The revenue and expenditure for three successive years is given as follows: 1906, £185,424 and £149,374 respectively; 1907, £179,802 and £156,811; 1908, £178,015 and £197,798. The public debt stood (1908) at £124,115 (£55,815 to the British government, bearing no interest). The Governor (Sir Everard im Thurn) is appointed by the Crown and is assisted by an executive council; he is president of the legislative council. Native affairs are administered by the chiefs, under the supervision of the Governor.

FILTRATION. See WATER WORKS.

FINANCIAL REVIEW. The financial and industrial conditions of 1909 can be understood only in relation to the events of the preceding years. The year of 1907 marked the culmination of the long upward swing in trade begun in 1897, after the crisis of 1893 had spent its force, and broken only by a temporary setback in 1903-4. That same year, however, brought a banking panic in October which forms the chief landmark in recent financial history. Thereafter there was a continued recession in business until the early spring of 1908, followed by a gradual revival. While 1908 was thus an after-panic year, the accumulation of bank reserves furnished the basis for an excellent securities market, led to the flotation

of many new issues and tended to give a more confident tone to all credit operations. The year 1909 was a remarkable one in the history of American financial and industrial development. Though its beginning was only fifteen months after the disastrous panic of October, 1907, trade was already beginning to revive; by its close the recuperation was not only fully accomplished, but in some lines new records had been established. This remarkably quick readjustment tended to confirm the views expressed at the time of the 1907 collapse, that the industrial and business conditions were sound at bottom but were hampered by defective banking and currency arrangements. The closing months of 1908 brought out some evidences of quickening confidence and trade, but the movement was very sluggish until February. In that month iron and steel producers made general and heavy reductions in prices; this so stimulated buying that by the first week in April some steel prices were restored. Wages were in many cases reduced. The inauguration of the new President in March aroused optimistic feeling, but this was largely offset by the beginning of the long controversy over the tariff (q. v.). Based on evidence of short supplies, small acreage and unfavorable crop conditions, the price of wheat rose extraordinarily during April and May, certain speculators in Chicago forcing it to \$1.51 per bushel late in May. The "commodities clause" decision of the Supreme Court, permitting railroads to own coal fields, gave an upward stimulus to the stock market (see RAILROADS). In June it became clear to the business interests of the country that the tariff schedules would be revised with the least possible disturbance of industrial conditions. This, together with favorable crop reports in early June, the great boom in building operations during the second quarter (see below), the easy money market based on immense bank deposits, general optimism, and the necessity of filling the voids in the markets due to months of restricted output and a reviving demand, resulted in a great upward surge in all lines of business about the middle of the year.

The tariff revision was completed early in August. Before the close of that month the United States Steel Corporation on the basis of increased earnings and unfilled orders raised the dividend on its common stock from 2 to 3 per cent. The prices of securities generally were greatly advanced, reaching about the levels of 1906. The beginning of crop movement in August absorbed many previously idle cars; the heightened demand for the late fall and winter trade increased the demand for labor and tended to raise wages. The prices of food products, especially meats, continued high and even tended to advance (see PRICES). By October car shortages were reported for the first time in two years. The activity in iron and steel was very great during the closing months, the December output of pig-iron being 2,560,000 tons as compared with 1,740,000 tons in January. There was at the same time very unusual activity in the metal trades, the demand for skilled workmen greatly exceeding the supply. On the other hand the cotton trade was greatly retarded by the extraordinarily high price of raw cotton. On the basis of the final estimate of the government that the 1910-11 crop would equal only 10,088,000 bales, the price of middling upland cotton advanced to 15.2 cents per pound in November and to 16.15 cents in December. A short break in the stock market

followed the decision of the Circuit Court dissolving the Standard Oil Company (q. v.). The December holiday trade was remarkably voluminous, in many places exceeding the best years of the past. The report of the Department of Agriculture in December gave basis to the improved conditions, so far as these rested on the foundation of abundant crops, by estimating the aggregate value of the year's harvests at \$8,760,000,000, or about one billion dollars in excess of the previous record. That the volume of business in the last quarter was of record-breaking dimensions was shown by the bank clearings, which showed a daily average for the three months of \$548,000,000, as compared with \$460,000,000 for the first three months. Moreover, the aggregate dividend and interest payments to be made in January, 1910, by railroad, industrial and traction companies, banks and trust companies, the National government and Greater New York, as estimated by the *Journal of Commerce*, was \$202,022,000. This was fully 10 per cent. in excess of the similar disbursements in January, 1909. Dividends amounted to \$87,591,000 or 16 per cent. more than in January, 1909. During the year 120 corporations either increased or resumed dividend payments.

BANK CLEARINGS. The great revival of business during the year was clearly reflected in the increasing bank clearings. After January, which always shows extra large clearances, there was a perceptible and quite steady increase each month from 11,131 millions in February to 15,691 millions in December. Comparison shows that each month in 1909 had larger clearings than the corresponding month in 1908; the same is true for the last eight months of 1907, for the last seven months of 1906, and for all preceding months and years except March, 1905. The total clearings for the year were \$164,195,488,000, the largest in American history, contrasting to \$131,073,901,000 in 1908, \$143,991,528,000 in 1907, \$159,135,000,000 in 1906, and \$143,114,000,000 in 1905. Of the total, \$103,588,738,000 were credited to New York City, this sum being 30.6 per cent. larger than that city's clearings in 1908 and 18 per cent. larger than those in 1907, but about one per cent. smaller than the record of 1906. This New York figure is almost twice that for 1900. In the 103 cities outside of New York for which Bradstreet's gives returns, the clearings amounted to \$60,606,750,000, a new record maximum, a gain of 17 per cent. over 1908, of 7.1 per cent. over 1907 and of 11 per cent. over 1906. By geographical sections the percentage gains over 1908 were as follows: New England, 14.9; Middle, 29; Western, 14.4; Northwestern, 14.8; Southwestern, 22.3; Southern, 23.9; Far-Western, 20.5. Only four cities showed decreases from 1908 clearances, namely, Springfield, Mass., Scranton, Minneapolis, and Vicksburg. A few cities showed decreases from 1907 clearings and a few from those of 1906, otherwise new high records were everywhere established. The aggregate clearings at a few of the larger cities were: Boston, \$8,440,382,000; Philadelphia, \$7,021,756,000; Pittsburgh, \$2,361,076,000; Cincinnati, \$1,359,031,000; Chicago, \$13,781,843,000; Minneapolis, \$1,029,914,000; St. Louis, \$3,442,439,000; Kansas City, \$2,395,521,000; Baltimore, \$1,469,673,000; and San Francisco, \$1,971,208,000.

The foregoing comparisons should be dis-

counted for the increase in prices, before they become true indexes of the relative amounts of commercial transactions. (See PRICES.) The great crops of the year resulted in very heavy clearings at inland cities during the later months. This factor and the greater stability of business in general, with its increasing volume, led to most extraordinary totals for the last three months.

The Canadian clearings in 1909 aggregated \$5,191,507,000, this being a new maximum and a gain of 25.3 per cent. over 1908. The clearings at Montreal amounted to \$1,866,649,000; at Toronto, \$1,437,700,000; and at Winnipeg, \$770,649,000.

STOCKS AND BONDS. The year was one of the most notable in the stock market history, both for volume of business and for marked continuous upward movement in prices. The transactions in stocks exceeded those of all preceding years except 1906, 1905 and 1901. The total for the New York Stock Exchange, according to *The Journal of Commerce and Commercial Bulletin*, was 212,563,644 shares. The heaviest trading was done in the months of June, August, September and October. The low prices of the year were in very many cases made in February, but the upward movement began in March. This was strengthened by favorable crop reports in the early spring, by the Supreme Court decision interpreting the commodities clause of the Hepburn act in May and by the great crops assured by early summer. High railroad earnings leading to rising dividends resulted in a very rapid advance in railroad stocks in July and August, an advance checked by the death of Mr. Harriman in September. Many industrials reached their year's maximum in November, while the closing weeks witnessed extensive manipulations of the Rock Island group of stocks. The average price of twenty leading railroad stocks reach 134 $\frac{1}{2}$ in August as against the low mark of 114 in February; they averaged about 120 in December, 1908, about 81 in November, 1907 and 138 in January, 1906. For twelve leading industrials the November maxima averaged 100 $\frac{1}{2}$, as against 80 in February, 88 in November, 1908; 53 in November, 1907, and the high average record of 103 in January, 1906. The increase during 1909 in the market value of the stocks of nine leading railroads aggregated \$215,363,760; and that of the stocks of nine leading industrials, \$422,768,942; these figures express vividly the buoyancy of the investment and speculative markets during the year.

The par value of stocks listed on the New York Exchange during the year amounted to \$1,154,990,370, according to *The New York Times Annual Financial Review*. This amount was more than twice the average for twenty years and has been only once exceeded, in 1901, when the United States Steel Corporation was formed. The railroad stocks listed amounted to \$573,486,150, including \$152,665,800 of preferred stock of the National Railways of Mexico, \$92,898,000 Northern Pacific, \$80,000,000 Pennsylvania, \$75,000,000 Southern Pacific, \$100,000,000 Chicago, Milwaukee and St. Paul. The listings of industrial stocks aggregated \$361,033,300, including \$50,000,000 common and \$50,000,000 preferred of the American Smelting and Refining Company. Telegraph and telephone stocks to the amount of \$112,346,600 were listed, including \$75,518,800 of the American

Telephone and Telegraph Company. These listed stocks include some authorized during 1908, but do not include all stocks authorized during 1909. These latter, according to *The Journal of Commerce and Commercial Bulletin*, amounted to \$565,032,000 for railroads and to \$432,115,100 for industrials. Of these sums, respectively \$309,064,800 and \$301,607,400 were actually issued during the year. The later weeks of the year were marked by a weakening of the bond market and a strengthening of that for stocks, leading both railroads and industrial companies to convert bonded indebtedness and notes bearing fixed charges into the more speculative form of securities.

The par value of bonds sold on the New York Exchange aggregated \$1,311,874,700, an amount never before equaled, being 21 per cent. larger than the previous maximum established in 1908. The first half of the year supplied a remarkably good bond market, but with the increase in stock dividend rates and a general increase in money rates, the bond market weakened considerably, there being evidence of liquidation in bonds at the close of the year. The bonds listed on the New York Exchange during the year amounted to \$1,009,518,600, a sum equaled only in 1905. The total amount of bonds authorized during the year by railroads, traction companies, industrial and mining corporations, as compiled by *The Journal of Commerce and Commercial Bulletin*, was \$1,970,365,500. Of this vast sum, railroads authorized \$1,613,803,500, but issued only \$653,355,900. All of these sums exceeded corresponding figures for 1908. The year, like its predecessor, was characterized by extensive refunding and also payment of maturing obligations, these operations being largely responsible for the extensive authorizations. These bonds authorized by railroads included \$233,562,500 by the Atlantic Coast Line, \$175,000,000 by the Missouri Pacific, \$135,000,000 by the National Railways of Mexico, and \$75,000,000 by the Southern Pacific Company. Bonds authorized by industrial corporations aggregated \$356,562,000, of which \$322,181,000 were issued. Notes issued by railroads during the year amounted to only \$52,786,580, or less than one-fifth the note issue of the preceding year. Notes issued by industrial companies amounted to \$42,625,000, or about double those of 1908. Mention should be made also of \$88,000,000 of 3½ and 4 per cent. New York City corporated stocks listed during the year.

FAILURES (a) *Commercial.* Bradstreet's reported the number of business failures for 1909 as 11,864, a decrease of 15.5 per cent. from the number in 1908, though a larger number than in any other year since 1897. The failures were only .77 per cent. of the total number in business, a smaller rate than in all but five of the preceding twenty-eight years. The total liabilities, \$140,453,000, were less than one-half those of 1908 and considerably below the average for the past thirty years. The assets were \$69,408,000, the ratio of assets to liabilities, 49.4 per cent., being the lowest in seven years, and also below the thirty-year average. This low ratio is taken as an index of the absence of general financial strain, and as showing that the failures were real failures and not temporary suspensions due to bad general conditions.

By groups of States the failures show decreases in every section, both in number and in liabilities, in comparison with the preceding

year. The reductions in numbers were greatest in the Middle, Northwestern and Far-Western States, and least in New England. Likewise as to liabilities, there was a decrease from those of 1908 of 63 per cent. in the Middle States, 60 per cent. in the Northwestern, 46 per cent. in the Far West, 40 per cent. in the South, and only 19 per cent. in New England. These figures indicate a greater amount of financial strain in New England during the year than in other parts of the country. Nevertheless, the number of failures, and the total assets and liabilities were smaller in New England than in any recent year except 1906. Moreover the great decreases in the figures referring to the Middle, Northwestern, and other groups outside of New England are largely accounted for by the relatively high figures for these groups in 1908. Compared with the figures for years preceding 1907, those for New England show more stable results than those of any other group. In the Manhattan and the Bronx boroughs of New York City the failures (1420) were 30 per cent. fewer than those of 1908, but somewhat more numerous than those of the few years preceding 1908; but the assets (\$4,494,000), were only a twelfth of those of 1908, only one twenty-second of those of 1907, and smaller than in any other recent year; and the liabilities (\$22,283,000), were less than one-fourth those of 1908 and only about one-sixth those of 1907.

According to the statistics of R. G. Dun and Co., for the year ending November 30, 1909, the failures among manufacturing concerns numbered 3063, with liabilities amounting to \$64,232,000, or about one-half those of 1908; among general stores, 1555, with \$10,698,000; among groceries and markets, 2380, with \$9,200,000. Failures of brokers and transporters numbered 361, with liabilities of \$19,604,000, as compared with 609 with liabilities of \$41,065,000 in 1908.

(b) *Financial.* R. G. Dun and Co. reported the number of bank failures at 77, with aggregated liabilities of \$24,177,000, the comparative figures for 1908, in their record, being 188, with liabilities of \$127,544,000.

CANADA. The number of business failures in Canada and Newfoundland in 1909 was 1591, or 7 per cent. fewer than in 1908, but more than in other recent years. The liabilities were \$12,824,000 and the assets, \$6,242,000, these amounts being slightly below those of 1908 and 1905, but greater than those of 1907, 1906, and 1904.

NEW CORPORATIONS. The new incorporations formed during 1909 were greater in number than in any year of the previous decade, and therefore probably greater than ever before, according to *The Journal of Commerce and Commercial Bulletin*. The number in New York State was almost 12,000 for the year. Massachusetts, Delaware, New Jersey, and Illinois also chartered more companies than ever before, but Maine had a somewhat reduced business in this line. The aggregate capital of new companies formed in the Eastern States having at least \$1,000,000 each, was \$1,566,989,000; the total for the entire country was \$1,920,389,000. If to this be added the capital of companies having \$100,000 and over the total reaches \$2,465,500,000. The aggregate capital of the new companies exceeded that of 1907 or 1908, but was much less than that of 1906 or 1901.

BUILDING. According to reports to Bradstreet's from about 100 cities the total expenditures for building during 1909 was \$841,938,

000, an increase of 37.3 per cent. over the total for 1908. The expenditures for the first quarter of 1909 showed an increase of 89.2 per cent. over those of the corresponding quarter of 1908; those of the second quarter an increase of 46 per cent.; those of the third quarter an increase of 28.6 per cent.; and those of the fourth quarter an increase of 5.4 per cent. over the corresponding quarter of the preceding year. The superiority of 1909 over 1908 thus decreased as the year advanced, partly owing to absolute decrease in building undertakings after the second quarter of 1900, and partly owing to the revival of business during the second half of 1908.

ENGLAND. The year was far from a normal one for English industries. While there was moderate prosperity in the iron and steel, the shipbuilding, and the woolen trades, the cotton trade was in a deplorable state, and many others marked time. The greatest single cause of disturbance was the budget controversy and its attendant agitation of protection as against free trade. The cotton industry had not recovered from the panic of 1907, partly owing to the undue expansion of mills during the speculative boom of 1905-7, and partly owing to the high price of cotton. This latter cause, together with the speculative fluctuations on the New York and New Orleans Cotton Exchanges, was largely responsible for the demoralization during 1908. The year was notable for the great changes in the rate of discount of the Bank of England and for the great amounts of money advanced by English bankers to New York stock speculators. See **BANKS AND BANKING.**

GERMANY. Conditions in Germany were on the whole quite comparable to those in the United States. There was very rapid recovery from the industrial depression of the preceding year, with all industries, except the electrical, running at somewhat less than full capacity. The rapid recovery was attended by the flotation of large amounts of new securities and by most unprecedented stock speculation. One notable feature of this was the absorption of a large amount of foreign securities. During the first nine months the foreign securities listed on the German exchanges or taken up by public subscriptions amounted to \$150,000,000, as compared with \$30,000,000 last year. The strength of Germany in international trade relations is shown by the fact that she absorbed these securities and during the same nine months received merchandise to the value of \$297,000,000 in excess of exports, without losing more than a negligible amount of gold. See **BANKS AND BANKING.**

FINLAND. A Grand Duchy on the Gulf of Bothnia, forming part of the Russian Empire. The capital is Helsingfors.

AREA, POPULATION, ETC. Area, 144,255 square miles, of which over 11 per cent. is under lakes. Population at the end of 1906, 2,933,850, of whom 2,523,049 were rural and 410,807 in towns. In 1907 the population was officially estimated at 2,925,300. The population included (1900) about 2,353,000 Finns, about 350,000 Swedes, and about 6000 Russians; Lutherans numbered about 2,002,000. The principal cities, with population in 1907, are: Helsingfors, 130,844; Abo, 46,037; Tammerfors, 43,696; Viborg, 33,175; Nikoloistad, 19,532; Uleoborg, 18,398; Björneborg, 16,602. A relatively high standard

of education is maintained, and, except along the Russian border, there is very little illiteracy. The University of Helsingfors has over 2500 students.

PRODUCTION. The production in hectolitres of the leading crops in 1906 was: Potatoes, 7,200,347; oats, 6,911,854; rye, 4,203,125; barley, 1,911,347. At the end of 1906 live-stock numbered: Cattle, 1,476,525; sheep, 912,467; horses, 325,642; swine, 218,923; reindeer, 141,572; goats, 5674. The Crown forests in 1906 covered 12,871,986 hectares, giving occupation to nearly 24,000 workers and producing 3,259,000 cubic metres of timber; they yielded an income of 6,995,000 marks, nearly five times the cost of maintenance. In 1906 the production of iron ore in metric tons was 35,820; pig iron, 15,865; bar iron, 22,531. There were in 1906 8827 manufacturing establishments, employing 113,518 workers and turning out a product (exclusive of flour mills) valued at 439,478,000 marks. The leading manufacturing industries were wood, iron, and mechanical works, textiles, paper, leather, and chemicals.

COMMERCE AND COMMUNICATIONS. Imports and exports in 1907 were valued at 379,100,000 marks and 267,200,000 marks respectively; in 1908, 363,500,000 and 245,000,000. The principal imports in 1908 were, in millions of marks: Cereals, 88.6; machinery, 24.6; iron and iron manufactures, 20.1; minerals, 19.2; coffee, 14.2; cotton, 13.4; sugar, 12.2; chemicals, dyes, and colors, 12; cotton textiles, 7.1; yarn, 6.4; meats 6; tobacco, 5.9; hides and skins, 5.7. The principal exports were: Wood, 126.1; paper and wood pulp, 42.5; butter, 31.5; hides, skins, and leather, 7.9; fish, 4.0; wooden articles, 3.0; cotton textiles, 3.9. The trade by countries in 1907 and 1908 was as follows, in millions of marks:

Countries	1907		1908	
	Impts.	Expts.	Impts.	Expts.
Germany	111.2	72.5	146.0	25.7
Russia	152.9	30.8	99.0	67.7
Great Britain	45.6	84.3	46.6	81.6
Denmark	26.8	8.5	25.6	6.4
Sweden and Norway	19.8	9.8	20.7	3.5
Belgium and the Netherlands	12.1	21.8
France	4.6	21.7
Spain	3.1	7.1
Other countries ...	22.8	60.3	5.8	4.0

In 1908 there entered the ports 8659 vessels, of 2,585,312 tons (958,297 Finnish, 202,658 Russian, and 1,424,357 foreign); and cleared, 8681 vessels, of 2,554,876 tons (934,643 Finnish, 194,458 Russian, and 1,425,775 foreign). The merchant marine on January 1, 1909, consisted of 3160 vessels, of 383,205 tons (steamers, 441, of 68,649 tons). In January, 1909, there were 2142 miles of railway in operation, over nine-tenths being owned by the state. Post-offices in 1908 numbered 1850.

FINANCE. The Grand Duchy has its own financial and customs systems. The monetary unit is the mark, worth one franc, or 19.3 cents. Revenue and expenditure in 1907 amounted to 134,382,249 marks and 130,340,191 marks respectively; in 1908, 160,507,038 (including 24,722,561 extraordinary) and 167,993,796 (including 52,303,909 extraordinary) respectively. The principal sources of ordinary revenue in 1908 were: Customs, 48,333,238 marks; railways, 40,837,791; public lands and forests, 10,778,785;

excise, 9,357,904; indirect taxes, 6,263,639; posts, 6,240,000; stamps, 2,787,445. The leading branches of ordinary expenditure were: Communications, 43,817,219 marks; worship and public instruction, 15,668,431; civil administration, 12,459,738; public debt, 6,251,596. On January 1, 1909, the public debt stood at 152,083,543 marks.

GOVERNMENT. The Emperor of Russia is the Grand Duke, who summons and may dissolve the Diet. This body, which is unicameral, is chosen by direct proportional election, the suffrage being possessed by each citizen (with the usual exceptions) who has reached his or her twenty-fourth year. Every voting citizen is eligible to the Diet, to which at the first election, in 1907, 22 women were elected. The Diet, which lasts for three years, unless sooner dissolved, has power to enact legislation which does not affect the fundamental laws or the organization of land and sea defense. The Grand Duchy is included in the St. Petersburg military district. The executive, at the head of which are the Governor-General and the Russian Secretary of State for Finland, is responsible both to the Grand Duke and to the Diet. The Governor-General in 1909 was Gen. W. A. Boeckmann.

HISTORY. The first session of the Finnish Diet lasted less than a week. It was opened on February 18, but dissolved on February 22 by the Czar's order, because the speaker had disregarded the Czar's wish that he should confine himself to the expression of loyal sentiments when replying to the Czar's opening message. The speaker had referred to the regret on the part of the people that matters concerning Finland were reported to the Czar in a manner that did not conform to Finnish laws and that was injurious in its effects. The Russian press generally approved the dissolution for the reason that the Diet had objected to the proposed plan of submitting bills affecting Imperial interests to a joint preliminary consideration by the Secretary of State for Finland and the Council of Ministers. The next session, which assembled in June, was also dissolved by the Czar (November 26), having refused to pass the military grant. See RUSSIA, paragraphs on *History*.

FINLEY, MARTHA. An American writer, died January 30, 1909. She was born at Chillicothe, Ohio, in 1828. Under the pen-name "Martha Farquharson" she published in 1868 the first of the "Elsie Dinsmore" books. This was so successful that it was followed by twenty-two "Elsie" books, the last, *Elsie and Her Namesakes*, in 1905. These books are among the most widely read books for girls ever written. Miss Finley was the author also of a series of juvenile stories called the "Mildred" series.

FIRE INSURANCE. See FIRE PROTECTION.

FIRE LOSSES. See FIRE PROTECTION.

FIRE PROTECTION. The successful use of New York's high-pressure system, whose installation in Brooklyn and the lower part of Manhattan was so marked a feature of the developments in this field during 1908, continued in 1909, and attracted even greater attention to fire protection from a central pumping station by means of independent high-pressure mains and hydrants. Early in the year the Manhattan system received a most thorough

test in the occurrence of three large fires almost simultaneously, and these were successfully extinguished without the use of engines. Previously the hose wagons had been given right of way over the engines in responding to alarms, but the latter always accompanied the firemen for use in case of failure of the high pressure or other emergency. So successful and reliable did the high pressure show itself that during the year 1909 orders were issued relieving the engines from responding to alarms in the high-pressure district save under exceptional circumstances, and the hose wagons, carrying the high-pressure hose with the water tower and ladder trucks, comprised the mobile equipment. The New York Fire Department during the year employed in connection with the high-pressure service a powerful gasoline automobile hose wagon, which more than met expectations and was considered to be the beginning of an extensive use of automobile apparatus in that conservative, but efficient, department. This machine received a thorough test over all conditions of pavement and in all kinds of weather. It was found able to develop speeds up to forty miles an hour, and in a year of service did not fail once in answering an alarm.

In the extension of the service on the East Side an interesting improvement planned by the Department of Water Supply, Gas and Electricity, was introduced which greatly increases the efficiency of the system and especially its reliability. In laying the mains in this new territory it was decided to install them on two independent systems, interconnecting, however, at certain points where electrically controlled valves were located. The mains of each system to which the hydrants were connected were to be laid normally in alternate streets. Ordinarily, there would be a hydrant in close proximity to any possible scene of fire and abundant water would be forthcoming as soon as the alarm was turned in and the electrically driven pumps at the central stations were started. But should there be a failure of a main due to breakage, then the efficiency of the entire system is impaired, and this is not a remote possibility in New York, where excavations of the streets, made often by irresponsible workmen, may weaken the mains. In fact such an occurrence actually took place in 1908 when a failure of an improperly supported and protected pipe occurred in a subway excavation. The improved system planned provided for electrically controlled valves whereby one-half the system can be instantly closed down, instead of requiring from one-quarter to half an hour to operate the hand valves of the older system. Now, as it was provided in the arrangement of hydrants to have these so spaced that one of either system was always within a short distance of any possible fire, at the worst the use of a few extra lengths of hose would be all that would be required. This innovation was believed to more than double the efficiency of the new extension, the actual construction of which was begun during the year.

A beginning was made in San Francisco with the high-pressure system, and in Chicago, where need of such protection seemed to be evident, an extensive report was prepared by the city engineer in which the work of other cities in this field was shown. In fact, it seemed to be proved by New York's experience, as stated by Chief Croker, that with the high pressure and the

well-organized fire department any fire could be confined to the building of its origin and the damage of conflagration practically removed.

The use of motor-operated and propelled fire apparatus during 1909 increased, and it was apparent that it had passed the experimental stage. These automobile engines consist of gasoline pumps of moderate capacity mounted on motor-driven vehicles capable of a speed up to 40 miles an hour, and carrying a supply of hose. They are always in readiness and can be dispatched at high speed to any point of an alarm much more quickly than horse-driven apparatus. A number of these machines were introduced into the fire departments of various American cities and have proved successful. In fact in some cities it is believed that increased protection and economy can be secured by having double companies in a single fire house, and trusting to the speed of the motors to reach the fire in season. Automobile ladder trucks were also meeting with favor and were purchased by a number of departments. In these a four-wheeled high-power motor takes the place of the ordinary front wheels, thus making a six-wheeled vehicle. Not only is the motor powerful enough to secure the requisite speed, but the arrangement has been found to be as readily controlled and steered as the ordinary truck, and affords a stable base for the extension ladders. There were also in use motor vehicles for salvage and emergency corps, chemical engines, hose and combination wagons, not to mention high-speed cars for chiefs and supervising officers, all of which showed increased use and great improvement during the year. In many cities attention was being paid to water supplies and alarm systems, and in New York a study of the much-needed replacement of its obsolete telegraph alarm system was undertaken. It was found necessary to recommend a complete new system with a central station removed from the present non-fireproof Fire Headquarters, and an independent isolated building located at some such central point as in Central Park was considered desirable.

The fire losses for the year according to *The Journal of Commerce and Commercial Bulletin* (New York) amounted to \$203,649,200. This shows, however, a reduction of some thirty-five million dollars from the record of the year 1908 and is considerably over fifty millions below the average for the five years ending with 1909, which was high, owing to the fact that the San Francisco conflagration losses of 1906 are included therein. As compared with the fire losses of 1908, which aggregated \$238,562,250, the record for 1909 showed a steady decline in the value of property burned throughout the entire year.

The relative increase in the average annual fire loss when compared with the increase in the estimated aggregate wealth of the country would seem to indicate that the fire waste was very excessive. The average annual fire loss for the five years 1877 to 1882 was \$76,489,600, whereas the average yearly fire loss for the five years ending with 1909 was \$257,827,475, showing an increase of 337 per cent. On the other hand, taking the estimates of the Bureau of Statistics, the aggregate wealth of the country in 1909 was \$107,104,000,000, as compared with \$42,642,000,000 estimated wealth in 1880, or an increase in the thirty years of 251 per cent. Thus it would appear that the ratio of increase in fire

waste had far outstripped the ratio of increase in the wealth of the nation.

The fire losses in this country and Canada during the past thirty-three years aggregate the appalling sum of \$4,712,537,525, showing an average of \$142,804,000 per annum.

There were during the year 1909 some 3270 fires, where the loss in each instance reached or exceeded \$10,000, a number decidedly less than was credited against any of the four years previous, and by some insurance authorities this fact is believed to mark, not only better business conditions, but a more active realization of the tremendous waste occasioned by fires due in large part to improper conditions of buildings and maintenance. Classified according to their destructiveness the fires of 1909 and seven preceding years show the following results:

	\$10,000 to \$50,000	\$50,000 to \$100,000	\$100,000 to \$200,000	\$200,000 to \$500,000	\$500,000 to \$750,000	\$750,000 to \$1,000,000	\$1,000,000 to \$2,000,000	\$2,000,000 and over	Totals
1909.....	1,128	570	457	444	174	857	180	3,273	
1908.....	1,644	754	587	407	102	339	145	4,068	
1907.....	1,671	764	547	429	209	299	154	4,073	
1906.....	1,899	663	477	360	163	252	125	3,459	
1905.....	1,826	637	502	567	159	258	101	3,563	
1904.....	1,180	595	482	398	175	238	106	3,100	
1903.....	1,040	498	381	380	171	218	106	3,080	
1902.....	821	468	335	343	135	210	119	2,400	

During 1909 there were twenty-six instances where a loss of \$500,000 or more was caused. These fires were as follows:

New York City, wholesale grocery and other	\$ 680,000
Boston, Mass., automobile warehouse and repair plant	750,000
North Cheimsford, Mass., worsted mills	500,000
Toledo, Ohio, business block	500,000
Galveston, Tex., wharf and cotton	500,000
Jersey City, N. J., railroad piers and lighters	800,000
Fort Worth, Tex., various	800,000
Chicago, Ill., grain elevator	1,000,000
Akron, Ohio, business block	500,000
Fresno, Cal., fruit packing plant	500,000
Port Costa, Cal., grain docks	1,000,000
Saskatchewan, Canada, forest fires	700,000
Tonopah, Nev., railroad repair shop	500,000
Monticello, N. Y., hotels and business houses	800,000
Decatur, Ill., several business blocks	1,000,000
Pittsburg, Pa., storage warehouse	500,000
Toronto, Ont., Parliament buildings	500,000
Poplar Bluffs, Mo., hotel and stores	500,000
Narragansett Pier, R. I., dwellings	1,000,000
Quebec, Que., grain elevator and docks	1,200,000
Dayton, Ohio, scale factory and other	550,000
White Plains, N. Y., dwellings	500,000
Baltimore, Md., several business houses	575,000
Kalamazoo, Mich., hotel and business blk and other	750,000
Racine, Wis., automobile top factory and other	650,000
Crystal River, Fla., pencil factory and other	500,000

FISH AND FISHERIES. In June, 1909, Dr. F. B. Sumner, Director of the laboratory of the U. S. Bureau of Fisheries at Woods Hole, Mass., reported on the work of the preceding summer, and published announcements for the season of 1909. Eighteen salaried investigators were at the laboratory during the season of 1908, and thirteen worked without

salary. A biological survey of the Woods Hole region begun some years earlier would, it was expected, be completed by the end of 1909. The report of the survey up to the time Dr. Sumner's report was written, recorded over 1400 species of animals and over 250 of plants in this region. The hawksbill turtle had recently been caught in the vicinity of Woods Hole, an occurrence which seems not to have been mentioned earlier. Work at this laboratory was continued during the season of 1909, a large number of investigators being present. In order that Director Sumner might have leisure to finish several pieces of unfinished work, Dr. Raymond C. Osburn was Acting Director for the season.

It was reported during the year that Horace Knowles, United States Minister to Rumania, was proposing to send a carload of Black Sea sturgeon to the United States, to attempt the re-introduction of these into Atlantic Coast rivers, where they are practically extinct.

United States Bureau of Fisheries Document No. 644, published in 1909, deals with the distribution of fish and fish eggs by the Bureau in 1908. The Bureau has adopted a uniform classification of young fish as to size as follows:

Fry —, up to the time yolk sac is absorbed.

Advanced fry —, from fry up to one inch.

Fingerling —, 1 inch to yearling stage.

Yearling —, one year old, but less than two.

In 1908, 2,413,809,225 young fish were distributed for public and private use in the United States, and 457,647,055 eggs sent to State and foreign hatcheries. The report contains further details of work done by all the hatcheries under the supervision of the Bureau. United States Bureau of Fisheries Document No. 845 summarizes the results of the Alaska fisheries in 1908. The salmon season was, on the whole, a prosperous one, the value of the output for the year being \$10,185,783. Detailed statistics for the various fisheries are given in the report. Some violations of the fishery laws were prosecuted and convictions obtained.

For the purpose of getting an estimate of the number of salmon ascending a single river, a contrivance was erected on Wood River, by which the fish could be counted as they came in, giving an estimated number of 2,600,000. Alaska codfish was reported as getting a foothold in Eastern markets, the value of the product for 1908 having been \$133,915. The value of the halibut catch was \$174,542, and that of herring \$23,650. The whale industry in Alaska is of considerable importance, but no data were given to show its value in 1908.

At the newly established biological station of the United States Bureau of Fisheries at Fairport, Iowa (see BIOLOGICAL STATIONS), an especial study is being made of methods for the artificial propagation of the fresh-water mussel. The shells are used in the manufacture of pearl buttons, over 50,000 tons of shells, with an output worth \$6,000,000 annually, being used for this purpose. The industry centres at Muscatine and Davenport, Iowa, between which cities the new station is situated.

The Report of the North Sea Fisheries Investigation Committee, for the year, may be summarised: 1. In legislation requiring the return to the water of all fish below a certain size, it is important to know how much the fish may have been injured by the process of catching. Experiments show that the otter trawl

causes much more injury to the fish than the beam trawl. 2. The age of the plaice can be determined by counting the concentric rings on the otoliths. Using this as a method of estimating age, Dr. Wallace has demonstrated that the fish may reach sexual maturity at different ages in different localities.

Dr. J. Stofford, working in 1904 at Malpeque, Prince Edward Island, reported in 1909 the results of observations on the young oysters. Previous workers had studied the oyster embryo up to the veliger stage, and from the "spat" condition to the adult. Between these there has been a gap, which Stofford's investigations seem to have bridged. By a study of the plankton he was able to recognize the oyster, and able to follow its later stages from plankton material. The free swimming period lasts, he thinks, about a month, fixation occurring when it is about 0.38 mm. long. Of importance is the discovery of a foot in the young oyster, which is lost after the "spat" period begins.

E. J. Allen thinks that there is a close correlation between the number of hours of bright sunlight during the first quarter of the year and the size of the mackerel catch on the English coast. Data collected for years from 1902 to 1908 apparently lead to this conclusion. This is because bright sunlight during February and March increase the number of diatoms in the water, thus producing an increase in the food of copepods, and thus indirectly increasing the amount of the mackerel food.

FISHER, GEORGE PARK. An American theologian and historian, died December 20, 1909. He was born in Wrentham, Mass., in 1827, and graduated from Brown University in 1847. He studied theology at Yale Divinity School and at Andover Theological Seminary, and in Germany. In 1861 he was chosen professor of ecclesiastical history at Yale, and held this position until 1902, when he retired as professor emeritus. He was a voluminous writer, and among his published works were: *The Supernatural Origin of Christianity* (1865); *Life of Benjamin Silliman* (1866); *History of the Reformation* (1873); *The Beginnings of Christianity* (1877); *Faith and Rationalism* (1879); *The Outlines of Universal History* (1885); *History of the Christian Church* (1888); *Colonial History of the United States* (1892); *History of Christian Doctrine* (1896); *Brief History of the United States* (1896); *Edwards on the Trinity* (1903). He contributed also many articles to theological and general reviews.

FITCH, CLYDE WILLIAM. An American dramatist, died September 4, 1909. He was born in New York City in 1865, and graduated from Amherst College in 1886. During his college course he wrote several stories and short plays, and became locally famous in the delineation of female parts in the college theatricals. His plans for his life work were for either interior decoration or architecture. While he was debating between the two, he wrote several stories and a one-act play, *Betty's Finish*, which was produced in Boston, and ran for two months. At this time Richard Mansfield was seeking for a play with Beau Brummel as the leading character. Mr. Fitch was recommended to him, and the play was written and produced in 1890 as *Beau Brummel*. It was an instant success, and at once established Fitch as a playwright.

Mr. Mansfield appeared in this part over 1000 times, and it remained one of the favorites in his repertoire. Following this success Fitch went abroad and made a study of French drama and the French stage. Plays came from his hand thereafter with a rapidity which occasioned considerable criticism. In 1901 four of his plays were at one time running in New York theatres. Mr. Fitch answered his critics by declaring that many of the plays written with such apparent rapidity had really been composed years before, in a period when managers would not produce them. *Beau Brummel* was followed by *A Modern Match*, and this by a steady succession of plays, for the most part successful, until the time of his death. He wrote many plays to suit individual stars; among them were *His Grace De Grammont* for Mme. Modjeska; *Nathan Hale* for N. C. Goodwin and Maxine Elliott; *Barbara Fritchie* for Julia Marlowe; *The Girl and the Judge* for Annie Russell; *The Stubbornness of Geraldine* for Mary Mannering; and *The Toast of the Town* for Viola Allen. Among the best of his later plays was *The Girl with Green Eyes*, in which the late Clara Bloodgood appeared in the title rôle. He also adopted many plays from foreign languages. The best known of them were, perhaps, *Sappho*, *A Superfluous Husband*, and *The Marriage Game*. Mr. Fitch's plays dealt chiefly with contemporaneous American life. They were designed to entertain, and, for the most part, did so. They were constructed with great skill, for Mr. Fitch was a master of stagecraft. He concerned himself but little with "problems," but his *Climbers* will probably live as one of the keenest satires on American social life yet written. Although his work showed an advance in technical skill, and perhaps in seriousness, in his later plays, it is the opinion of many critics that *Beau Brummel* remained his best play. His last work, *The City*, a serious play, produced after his death, has been much praised for its dramatic force.

Besides the works mentioned above, Mr. Fitch wrote two books of fiction, *Some Correspondence and Six Conversations*, and *The Smart Set*. Several of his plays were published in book form.

FITZGIBBON. GERALD. An Irish jurist, died October 14, 1909. He was born in Dublin in 1837 and was educated at Trinity College, Dublin. He was admitted to the Irish bar in 1860 and the English bar in 1861. In 1872 he was made Queen's Counsel. In 1876 he was law adviser at Dublin Castle, and in 1877-8 was Solicitor-General of Ireland. From 1884 to 1896 he was Commissioner of National Education for Ireland and from 1885 to 1897 was Judicial Commissioner of the Educational Endowments. He was made Chief Justice of Appeal in 1898 and continued in this position until his death. Judge Fitzgibbon was a profound lawyer, a man of wide and varied learning, and was well known for his unswerving rectitude and conspicuous fairness.

FLAGLER, ISAAC VAN VLECK. An American musician, died March 16, 1909. He was born in Albany, N. Y., in 1848. He early showed talent as an organist, and was well known locally when he went to Paris and Germany to study music. On his return to the United States he was organist at Plymouth

Church, Chicago, organist and musical lecturer at the Chautauqua Assembly, Chautauqua, N. Y. For several years he taught music at Syracuse and Cornell universities and at the Utica Conservatory of Music. He was one of the founders of the American Guild of Organists. At the time of his death and for several years previous he was organist of the First Presbyterian Church at Auburn, N. Y. He composed several pieces of music and edited several collections. The most popular of his organ compositions is *Variations on an American Air*.

FLAX. In speaking of the flax crop of the United States, the flaxseed crop is always meant, as the flax fibre produced is a negligible quantity. The total production of flaxseed in 1909, according to the Department of Agriculture, was 25,856,000 bushels, the area devoted to the crop 2,742,000 acres, the average yield per acre 9.4 bushels and the total farm value on December 1, \$39,466,000. During the last few years the flaxseed production of the country has not varied much, but in general it has declined since 1902. The high price of the seed, which was 152.6 cents per bushel on December 1, brings the total value of this year's crop about 40 per cent. over the average of the previous five years. The growing of flax for seed is limited to about ten States, and about one-half of the total annual yield is produced in North Dakota. In 1909 North Dakota raised 14,229,000 bushels on 1,530,000 acres, the total value being \$22,340,000. South Dakota ranked second, with 5,640,000 bushels on 600,000 acres, valued at \$8,516,000, and Minnesota third, with 4,500,000 bushels on 450,000 acres, the crop representing a value of \$6,750,000. The other States producing flaxseed were Kansas, Wisconsin, Iowa, Missouri, Montana, Nebraska and Oklahoma, given in the diminishing order of crop values.

FLORENCE CRITTENTON MISSION.
See CRITTENTON, CHARLES N.

FLORIDA. The Southernmost State of the American Union. Its total area is 56,866 square miles, of which 3085 square miles are water. Its population in 1900 was 528,542. According to a Federal estimate made in 1909 the population in that year was 679,742. The capital is Tallahassee.

MINERAL PRODUCTION. The chief mineral product of Florida is phosphate. In 1908 there were produced 1,692,102 long tons of phosphate rock, valued at \$8,484,539, as compared with 1,357,365 long tons in 1907, valued at \$6,577,757. The industry has greatly grown since 1888, when the first shipment of pebble phosphate was made from Peace River. In 1889 hard rock phosphate was discovered in Marion County, and in 1890 the land pebble area was opened in Polk County. The production has shown an increase almost without exception each year since its beginning. The clay products are also important in the State. In 1908 they were valued at \$233,162, a considerable decrease over the product of 1907, which was valued at \$354,575. The clay mined includes plastic, kaolin, and brick-making clays. Mineral water was produced in 1908 to the value of \$20,569 from 123,552 gallons. There was a quantity of road-making materials mined including flint, chert, and road-making clays. The value of the mineral products of the State for

1908 was \$9,167,762, as compared with a value of the product of 1907 of \$7,365,754.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops of the State in 1909 were as follows, according to figures of the United States Department of Agriculture: Corn, 8,379,000 bushels, valued at \$6,055,000, from 665,000 acres; oats, 527,000 bushels, valued at \$395,000, from 31,000 acres; rice, 25,000 bushels, valued at \$20,000, from 1000 acres; potatoes, 475,000 bushels, valued at \$570,000, from 5000 acres; hay, 26,000 tons, valued at \$1,390,000, from 19,000 acres; tobacco, 3,195,000 pounds, valued at \$1,086,300, from 4500 acres. The cotton crop for 1909-10 was estimated at 57,000 bales. The production has steadily fallen from 1904, when the crop was 80,551. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 55,000; mules, 21,000; dairy cows, 95,000; other cattle, 712,000; sheep, 98,000; swine, 456,000. The number of horses and all classes of cattle has increased considerably in the last few years. The wool clipped in 1909 was 250,480 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$3,388,690. Of these products the most important in value was mullet, of which 24,716,300 pounds, valued at \$652,030, were taken. Next in order of rank was sponges, of which 622,500 pounds, valued at \$544,880, were taken. Shad was caught to the number of 2,836,200 pounds, valued at \$319,800; red snapper, 7,718,900 pounds, valued at \$434,060; Spanish mackerel, 2,647,400 pounds, valued at \$122,330; squireague or trout, 4,864,100 pounds, valued at \$196,350; prawns, 4,151,900 pounds, valued at \$84,280; terrapin and turtle, 183,700 pounds, valued at \$22,110. Among other important fishes taken were black bass, bluefish, bream or sunfish, catfish, channel bass or redfish, crevalle, and sailor's choice. Oysters were taken to the amount of 1,066,800 bushels, valued at \$296,040. The alligator hides taken during the year numbered 50,900 and were valued at \$48,230. The total number of independent fishermen in the State was 3288, and the wage-earning fishermen numbered 5924. There were employed 327 vessels, valued at \$618,674.

EDUCATION. The total school population of the State is estimated by the Superintendent of Public Instruction in his biennial report for the two years ending June 30, 1908, at 224,667, while the total enrollment of all pupils of all the public schools for the same period was 134,722, only about 60 per cent. of the children of legal school age. Of the children enrolled, only about 70 per cent., or 94,897, were in average daily attendance. The average monthly salary of teachers was \$44.69 for a term of 5.4 months. The State has no compulsory attendance law, although attempts have been made to pass such a law through the legislature for several years. The legislature of 1907 passed a law regulating the salaries of county superintendents of public instruction, and established a graduated system of salaries ranging from \$600 a year as a minimum to \$2400. This measure has been found valuable in securing the services of competent men.

POLITICS AND GOVERNMENT. On April 26, Duncan U. Fletcher, who had been elected United States Senator at the primaries in 1908,

took his seat in the Senate. On April 22 the State Senate passed, by a vote of 24 to 7, the bill for the submission at the general election in November, 1910, of a State-wide Prohibition amendment, and on April 23 the House adopted the bill by a large majority. An amendment to the Constitution, relating to suffrage, known as the Beard Disenfranchisement Resolution, was on May 8 defeated in the House of Representatives. This resolution, which passed the Senate, contained the following clause: "Every male person of the age of 21 years and upwards who shall at the time of registration be a citizen of the United States," etc., "shall be deemed a qualified elector at all elections under this constitution." This act was in direct conflict to the Fifteenth Amendment to the Federal Constitution. The principal opposition to the amendment came from the Prohibition forces, who were strongly opposed to the submitting of this measure to the people at the same time as the State-wide Prohibition resolution. On June 11 the Governor signed the bill prohibiting race-track gambling in the State, but this act was not to go into effect until April, 1911, and, as there would be another session of the legislature before that date, the race track people had strong hopes that the act would be repealed before it became effective.

OTHER EVENTS. On October 11 a hurricane did great damage along the southern coast of the State, partially wrecking the city of Key West and doing damage to property to the amount of \$2,000,000. Martial law was proclaimed by the mayor of the city and United States troops were asked for to assist in patrol work. Nine large cigar factories, two fire stations, five churches and many blocks of residences and stores were destroyed. Six persons were killed and many others injured.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Acts were passed regulating the practice of osteopathy, optometry, and dentistry. The Board of Health was authorized to enforce rules for the protection of the public health and to establish and maintain sanitariums for the treatment of tuberculosis. Provision was made for fire protection in public schools and for the teaching of the elementary principles of agriculture and civil government. The drinking of liquor on trains was prohibited and also the sale of certain narcotics. A pure food law was enacted, together with laws for the suppression of contagious diseases in livestock and to prevent the pollution of water. Measures were enacted regulating the fire insurance companies and penalizing railroad companies for delay in settling claims. The laws relating to elections were amended to prevent corrupt practices.

OFFICERS. Governor, Albert W. Gilchrist; Secretary of State, H. C. Crawford; Treasurer, W. V. Knott; Comptroller, A. C. Croom; Attorney-General, Park M. Trammell; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. M. Holloway; Commissioner of Agriculture, B. E. McLin—all Democrats.

Judiciary—Supreme Court: Chief Justice, J. B. Whitfield; Justices, W. A. Hocker, R. F. Taylor, T. M. Shackleford, Chas. B. Parkhill and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

The State Legislature of 1909 was composed of 32 Democrats in the Senate and 68 Democrats and 1 Socialist in the House. The State Representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

FOLK LORE SOCIETY, AMERICAN. See ANTHROPOLOGY.

FOOD AND NUTRITION. Food INSPECTION. Efforts to check the adulteration and sophistication of food and drug products were continued in most civilized countries during 1909, to the steady improvement of the quality of these products and of the sanitary conditions under which they are prepared. In the United States, approximately 10,000 samples of foods and drugs collected in inter-State traffic and about 8500 samples of imported goods were analyzed under the National Food and Drugs act of June 30, 1906, and there were reported to the respective district attorneys for prosecution 494 cases, 359 more than the year preceding. Of the cases decided during the year, 85 resulted in convictions and fines, and 98 in decrees of condemnation and forfeiture of goods, whereas but 2 cases were lost by the government. Many of the cases successfully prosecuted were with reference to the adulteration of the milk supplied to several of the larger cities from near-by States, and led to a material purification of the milk supply. Substantial progress was also made in the exclusion from inter-State commerce of a number of the more pernicious nostrums and habit-forming drugs, and in the improvement of the quality of flavoring extracts. Only 44 violations of the national meat inspection law were prosecuted, of which 15 of those decided resulted in convictions.

Much attention was given to the formulation of food standards, a matter largely delegated by the law to the Secretaries of Agriculture, Treasury, and Commerce and Labor. Following a report of investigation conducted by the Referee Board of Consulting Experts, a body appointed by President Roosevelt in 1908 to consider important matters in controversy, in which healthy young men were used as subjects for a period of four months in experiments to test the effect of benzoate of soda on nutrition and health, a decision was announced whereby the use of this substance is now allowed, provided the amount used is stated on the container or package. Similar questions with reference to the use of sulphur dioxid, saccharin and copper sulphate were pending before the Referee Board at the close of the year. The importation of canned vegetables greened with copper salts was again permitted under certain restrictions. A decision as to the branding of whisky was rendered by President Taft, December 27, 1909, under which this term, which had previously been restricted to "straight whisky," is extended to include blends and goods made from rectified, distilled or neutral spirits, provided the source and process are indicated on the label. Under a decision promulgated by the Secretary of Agriculture, flour bleached by nitrogen peroxide has been declared adulterated since June 10, 1909. Other decisions of the year dealt with the labeling of turpentine, canned salmon and whitefish, and of wines, and with the importation of damaged coffee and the preparation and shipment of shellfish.

Most of the States also showed much activity in pure food matters. Nearly every State in which the legislature was in session amended its laws as to the manufacture and sale of food products, and in many States additional regulation and rulings were promulgated under existing laws. In a general way the trend was in the direction of uniformity with the National Food and Drugs act, particularly as regards standards, though there is still great diversity in requirements. At the close of the year, twenty-two States had adopted the Federal standards, and five of these States had also adopted the additional standards promulgated by the joint committee of the Association of Official Agricultural Chemists and the Association of State and National Food and Dairy Departments. In three other States the laws essentially prescribed the Federal standards. Alabama adopted a new law, which went into effect January 1, 1910, and among the other States making extensive alterations were California, Idaho, Illinois, Indiana, Louisiana, Maine, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, Wisconsin, and Wyoming. A noteworthy feature of many of the new laws was the increased insistence upon satisfactory sanitary conditions in factories, bakeries, dairies, restaurants, and other places where food products are prepared and sold. California, Indiana, Louisiana, New Jersey, North Dakota, Ohio, Tennessee, and Wisconsin gave particular attention to this phase in their new legislation, and there were many indications of an awakening of the general public to the need of greater stringency in such matters.

Outside the United States but little new food legislation was enacted, most of the civilized nations already possessing fairly effective laws. In Switzerland a new law went into operation July 1, 1909, in which special prominence is given to the inspection of imported food products. Hungary prohibited the manufacture and sale of adulterated wines, and in Denmark new regulations as to meats for export went into effect. Holland enacted a new law for dairy products, and France extended its pure food laws to Algeria.

The Second International Congress for the Repression of Adulteration of Alimentary and Pharmaceutical Products was held in Paris, October 17-24, 1909, with over 2000 delegates and visitors, representing twenty-eight nations and all parts of the world. The Congress completed the work of its predecessor at Geneva in 1908 as to formulating definitions of standard food and drug products for adoption as an international "codex alimentarius," with a view to securing greater uniformity in the work of food control. Much attention to food and nutrition problems, including food and drug inspection, was also given at the seventh triennial session of the International Congress of Applied Chemistry, which convened in London from May 27 to June 2.

PROGRESS IN FOOD AND NUTRITION STUDIES. Popular interest in food problems as related to national health and efficiency was well sustained throughout the year in the United States, where special impetus was given by the activities of the voluntary Committee of One

Hundred, the newly organized American Association of Home Economics, President Roosevelt's Homes Commission, which dealt more especially with sociological conditions in the District of Columbia, his Commission on Country Life, and other organizations. The recommendation of President Roosevelt in 1908 for the establishment of a Federal bureau of health, into which should be consolidated the various existing Federal agencies, such as the Food, Drug and Meat Inspection Service, and the Public Health and Marine Hospital Service was repeated by President Taft in his first annual message in December.

The nutrition laboratory of the United States Department of Agriculture was completed by the installation of the remodeled respiration calorimeter formerly at Wesleyan University, thereby permitting of the resumption of fundamental studies dealing with the metabolism of matter and energy, as well as of the utilization as food of agricultural products. A bulletin of the department was issued reporting experiments in which mental work was not found to exercise any appreciable effect on metabolism. The efficiency of the human body as a machine was calculated to be about 20 per cent., this being in accord with earlier studies. Other respiration calorimeter investigations were reported from the nutrition research laboratory at Boston of the Carnegie Institution, among these being studies of metabolism during fever and of the energy involved in typewriting. A small portable apparatus was devised at this laboratory for use in respiration experiments.

Several studies of the food habits and customs of native peoples were reported, chiefly dealing with conditions in the Orient, especially the Philippines, where it was found that the native diet is composed largely of fish, beans, rice, and fruit, and supplies substantially the same amount of protein and energy as the average American or European diet. Considerable attention was also given to the diet of children, notably in schools and charitable institutions, as well as to aged persons and people living in rural regions. Discussion as to the kind and amount of protein best adapted to the body's needs was continued. One of the more important contributions was by Rubner, who holds that the long continued use of a diet of low nutritive value and composed largely of vegetable foods, such as is commonly met with among the poor in Europe, is largely responsible for defective physical condition, decreased ability for work, an increase of morbidity and mortality, a lowered resistance to specific diseases, and similar undesirable results. Much attention was also given by investigators to the ash or mineral matter requirements of the body, especially the phosphorus metabolism.

A large amount of analytical and other miscellaneous data was reported as to various foods and related problems. Some of the more important topics dealt with were the composition of Hawaiian honeys, meat extracts, tinned foods, fish of various sorts, eggs, tea, coffee and cocoa, the ripening of dates, the milling of wheats and baking tests of flours, the influence of corn on pellagra and of rice on beriberi, the effect of cold storage on meats, the canning and preserving of foods by both commercial and domestic methods, and tests of fireless cookers and other household appliances.

COST OF FOOD. Despite the increased production of nearly every food crop, both wholesale and retail prices of food, as of most other commodities, continued to advance in most countries during the year. More attention than usual was given to studies bearing on this subject. One of these was a comprehensive investigation of the standard of living in New York City, from which the general conclusion was drawn that in that city, when less than 22 cents per man per day is spent for food, the nourishment derived is insufficient. Important studies were also conducted by the British government into the cost of living of the working classes in England, Ireland, France, and Germany.

Data compiled by the United States Department of Agriculture indicated that the increase in prices in this country since 1896 has been specially marked in farm products, the average price at the farm for these being 141.9 per cent. in excess of that in 1896, as compared with 126.4 per cent. for all commodities. An investigation as to meats, in particular, revealed that although the farm price for beef cattle has barely begun to rise above the level for 1896-1900, the retail prices for beef products, and all prices for other meats, have shown notable increases. Among the causes assigned for this are the diminished range areas, the high prices for grain, a disposition on the part of the consumer to buy only the more expensive cuts, and in the cities the multiplication of small stores and the growth of the costly delivery system. Studies of retail profits on beef in fifty of the larger cities showed an average of 38 per cent. gross profit in retailing, but in twelve of these it was 41.50 per cent. and in eleven over 50 per cent. As a result of the prevailing conditions the per capita consumption of meat in this country, which seventy years ago was about one-half the entire dietary, has declined to about one-third, and this has been accompanied by an increased per capita consumption of cereals, vegetables, fruits, and saccharine foods. These foods are likewise increasing in cost, however. On November 1, 1909, the wholesale prices of fifty-nine commodities were estimated by *Bradstreet's* as having advanced over the preceding twelve months, seventeen were unchanged, and thirty had declined. Among the striking increases were flour, milk, eggs, butter, and cheese.

Such data as are available for other countries indicate that the increase in food prices is by no means restricted to the United States, but prevails to a greater or lesser extent throughout the entire civilized world.

NEW BOOKS. Among the many important books of the year were the following: W. Robertson, *Meat and Food Inspection*, Chicago; F. Monier et al., *Traité théorique et pratique sur les fraudes et falsifications*, Paris; A. Jolles, *Die Nahrungs und Genussmittel, ihre Herstellung und Verfälschung*, Leipsic and Vienna; H. Dugat and A. L. Girard, *Les produits Alimentaires*, Paris; G. A. Sutherland, *A System of Diet and Dietetics*, London; W. G. Thompson, *Practical Dietetics*, New York and London; J. Crichton Browne, *Parsimony in Nutrition*, London and New York; E. Maurel, *Traité de l'alimentation et de la Nutrition à l'état normal et pathologique*, Paris; R. C. Chapin, *The Standard of Living Among Workingmen's Families in New York City*, New York; H.

Lungwitz, *Stoffwechselversuche über den Eiweissbedarf des Kindes*, Berlin and Halle; Margaret J. Mitchell, *The Fireless Cookbook*, New York.

FOOT AND MOUTH DISEASE. See VETERINARY SCIENCE.

FOOTBALL. The year 1909 without doubt marked the passing of the particular game of football developed in American colleges during recent years. The many serious injuries received by players in 1909 aroused such a general protest against the game as it was played that even its most enthusiastic admirers have little hope of the sport being retained unless radical changes are made in the playing rules. Statistics show that football caused the death of 32 players in 1909, a larger number than in 1907 and 1908 combined. Many colleges, including Annapolis, Georgetown, and the University of Virginia, failed to finish out their schedules because of fatalities and serious injuries to players in those colleges. Experts are undecided as to just what changes should be made to remove the element of danger from the game. Some maintain that the game should be made even more open than the new rules of 1907 provided, while others hold that injuries are more apt to be received in the open game than if a return were made to the old mass plays. All realize, however, that something must be done speedily if the game is not to be abolished.

As far as attendance and interest shown were concerned the season of 1909 was a most successful one. Yale again turned out a remarkable team and completely outclassed every team played against. The hardest struggle Yale had was with the Harvard eleven, also a brilliant aggregation of players, which took place in the Harvard stadium before 40,000 spectators. As in 1908, when Harvard won by a 4-0 score, neither team was able to secure a touchdown, Yale's victory coming through ten field goals. The order in which other Eastern colleges were placed in 1909 was: Princeton, Dartmouth, Pennsylvania, Lafayette, Brown, Williams, Cornell and New York University. The following gives a summary of the games played by the leading colleges in the East: *Yale* defeated Wesleyan 11-0, Syracuse 15-0, Holy Cross 12-0, West Point 17-0, Colgate 36-0, Amherst 34-0, Brown 23-0, Princeton 17-0, and Harvard 8-0; *Harrard* defeated Bates 11-0, Bowdoin 17-0, Williams 8-6, Maine 17-0, Brown, 11-0, West Point 9-0 (fatal injury to Byrnes, a West Point tackle, stopped the game after only a few minutes of the second half had been played), Cornell 18-0, and Dartmouth 12-3, and was defeated by Yale 0-8; *Princeton* defeated Stevens 47-12, Villanova 12-0, Fordham 3-0, Annapolis 5-3, was tied by Dartmouth 6-6, and was defeated by Lafayette 0-6 and by Yale 0-17; *Dartmouth* defeated Bowdoin 15-0, Williams 18-0, Amherst 12-0, Holy Cross 12-0, tied Princeton 6-6 and was defeated by Harvard 3-12; *Pennsylvania* defeated Gettysburg 20-0, Ursinus 22-0, Dickinson 18-0, West Virginia 12-0, Brown 13-5, Carlisle 29-6, Cornell 17-6, was tied by Lafayette 6-6 and Pennsylvania State 3-3, and was defeated by Michigan 6-12; *Lafayette* defeated Hobart 50-0, Swarthmore 22-0, Princeton 6-0, Pennsylvania State 43-0, and Lehigh 21-0, and tied Pennsylvania 6-6; *Brown* defeated Rhode

Island 6-0, Colgate 5-0, Bates 17-0, Amherst 10-0, Vermont 17-0, and Carlisle 21-8, and was defeated by Pennsylvania 5-13, Harvard 0-11, and Yale 0-23; *Cornell* defeated Oberlin 16-6; Vermont 16-0, and Rensselaer P. I. 16-3, tied Chicago 6-6 and was defeated by Fordham 6-12, Williams 0-3, Harvard 0-18, and Pennsylvania 6-17; *New York University* defeated Rhode Island 7-0, Haverford 29-0, Stevens 28-0, Wesleyan 13-12, Rutgers 11-0, and Union 47-0, and tied Lehigh 6-6.

The championship of the Western colleges was claimed both by Michigan and Notre Dame, but owing to the fact that the first-named eleven had a much harder schedule it would appear that it should receive first honors, even though Notre Dame won the game between the two colleges. Chicago, Minnesota, Illinois, and Wisconsin were other leading Western teams. The principal games of the season were: *Michigan* defeated Ohio State 33-0, Syracuse 43-0, Pennsylvania 12-6, and Minnesota 15-6, tied Marquette 5-5, and was defeated by Notre Dame 3-11; *Notre Dame* defeated Pittsburg 6-0, Michigan 11-3, Miami 46-0, and Wabash 38-0, and played a scoreless tie with Marquette; *Minnesota* defeated Lawrence 26-0, Iowa 41-0, Ames 18-0, Nebraska 14-0, Chicago 20-6, and Wisconsin 34-6, and was defeated by Michigan 6-15; *Chicago* defeated Purdue 40-0, Indiana 21-0, Illinois 14-8, and Northwestern 34-0, tied Cornell 6-6 and Wisconsin 6-6, and was defeated by Minnesota 5-20; *Wisconsin* defeated Lawrence 22-0, Indiana 6-3, and Northwestern 21-11, tied Chicago 6-6, and was defeated by Minnesota 6-34. In the South the University of Virginia and the Virginia Polytechnic Institute were the best teams.

The association or soccer championship of the Intercollegiate League was won by Columbia, with 4 victories and 0 defeats. Pennsylvania finished second and Haverford third.

FOREIGN MISSIONS, AMERICAN BOARD OF COMMISSIONERS FOR. An organization founded in 1810 by the Massachusetts Association of Congregational Churches, and incorporated two years later. It is the oldest foreign missionary society in the United States and its first missionaries were sent out in 1812 to India. Since that date the Board has commissioned 2572 persons. There were in 1909 twenty missions, including 107 stations and 1395 out-stations in Africa, Turkey, India, and Ceylon, China, Japan, Philippines, Spain, Mexico, Austria and Micronesia. The American missionaries number 581, and the churches under the auspices of the American Board number 584, with 73,671 communicants, of whom 5914 were added during the year. There were 1483 educational institutions of various grades, having 70,979 pupils. The native force of pastors, preachers, catechists and teachers was nearly eight times as numerous as the missionaries sent from America. The native communities contributed for Christian work only about \$25,000 less than the amount given by individuals and churches in America, or \$262,764. The receipts of the Board for the year 1909 were \$947,163, making the total receipts from the beginning \$39,527,427. The American Board is supported largely by voluntary contributions, though it has substantial endowment funds. The president is Samuel Capen, LL.D., and the secretaries are James L. Barton, D.D., and Corne-

Ius Patton, D.D.; editorial secretaries, E. E. Strong, D.D., and Rev. William E. Strong. The treasurer is Frank H. Wiggin. The headquarters of the Board are at the Congregational House, Boston, Mass.

FOREST LEGISLATION. See FORESTRY.

FORESTS, NATIONAL. See FORESTRY and LANDS, PUBLIC.

FOREST SCHOOLS. See FORESTRY.

FORESTRY. The forestry situation in the United States continues to be of vast importance, and the necessity for conservation is becoming better recognized. There are annually taken from the forests of the United States, including waste, but not the amount destroyed by fires, about 20,000,000,000 cubic feet of timber, while the estimated production is only 7,000,000,000 cubic feet. With this balance against the timber production, prompt action must be taken to avert or postpone the threatened timber famine. The conference on conservation, called by President Roosevelt in 1908, has been followed by other meetings, including the one at Washington, D. C., in February, 1909, to which delegates came from Mexico, Canada, and Newfoundland, in addition to those representing the United States. At the National Conservation Congress held at Seattle, Wash., August 26-28, 1909, forestry was one of the important topics of discussion.

According to the United States Bureau of Census the lumber business of 1908 showed the effect of the financial disturbance of 1907, more than twice as many mills being reported idle in 1908 as in 1907. The 31,231 active mills cut in 1908, 32,224,369,000 feet B. M. of lumber, 2,986,684,000 lath, and 12,178,490,000 shingles, valued at \$541,545,640. The average mill value of all lumber was \$15.37 per thousand, a decrease of \$1.19 per thousand from the values of 1907. As in 1907, Washington again took front rank in the lumber-producing States, with 8.8 per cent. of the total cut, followed by Louisiana, with 8.2 per cent., and Mississippi, with 5.6 per cent. Yellow pine furnished 33.8 per cent. of the total lumber produced, with Douglas fir second (11.1 per cent.), and white pine third (10.1 per cent.). Of the hard wood production, oak took first rank, with 8.3 per cent. of the total. The output of some of the other forest products was: Pulp wood, 3,346,953 cords, valued at \$8.38 per cord; crosties, 112,463,494, worth 50 cents each; tight cooperage staves, 345,280,000, valued at \$28.99 per thousand, and 19,703,525 sets of headings; tan bark and tanning extract to the value of \$21,361,719; veneers worth \$7,891,431; and products of wood distillation amounting to \$5,899,426. The exports of forest products in 1908 were valued at \$104,286,051; and the imports, mostly wood pulp, cabinet woods, gums, and rubber, amounted to \$101,189,803.

THE NATIONAL FOREST SERVICE. One of the principal functions of the United States Forest Service is the management of the enormous property embraced within the National Forests. On June 30, 1909, there were 150 National Forests, the gross area of which was 194,505,325 acres, an increase of 26,528,439 acres over 1908. Deducting from this area all patented lands or those against which claims have been entered, leaves 172,230,233 acres as the net area of the National Forests in the

United States, Alaska, and Porto Rico, all of which were under administration except those in Florida, Michigan, and Porto Rico. In the management of this area \$2,948,153.08 were expended in 1908, with \$599,471.02 additional for permanent improvements, such as trails, roads, telephone lines, fences, houses, etc. The total number of employees of the Forest Service on June 30, 1909, was 2881, 2582 of whom are stationed out of Washington, D. C. The total expenditures for forest work during the fiscal year were \$3,936,297.47. The receipts from the National Forests in 1909 were: Grazing, \$1,032,185.70; timber sales, \$736,102.08; special uses, \$38,082.88, or a total of \$1,807,270.66. Under the law 25 per cent. of the sales in any State or Territory is returned to it for school and road purposes. Under this law \$444,379 were deposited in State treasuries, the balance going into the Federal treasury. In addition to the sales mentioned, the free use of range and timber was granted to settlers to the value of \$169,081.12. The creation of forest districts, over which officers are placed so that most matters can be speedily adjusted, has worked well, and a marked improvement can be noted in sentiment toward the forest policy as the business is expedited and differences more easily reconciled.

In addition to administering and protecting the National Forests, considerable work is being done in extending them through planting operations. Forest nurseries, with a capacity of over 8,800,000 trees, have been established in twenty-four of the National Forests, and there are 721,000 trees available for immediate planting. Two forest experiment stations have been established, one in the Coconino Forest in Arizona and the other on Pike's Peak in Colorado. Some of the problems of the reforestation of cut-over lands will receive immediate study. The Forest Service is conducting many scientific investigations, and in coöperation with the Indian Bureau of the Department of the Interior, it has managed the forests of the Indian Reservations. For the War and Navy Departments the reforesting of their reservations is being done. Much coöoperative work is being carried on with States, corporations, and individuals. For private owners more than 700,000 acres in twenty-six States have been given a field examination. Studies are being made of forest supplies, markets, etc. Extensive investigations are being made of wood preservation, timber tests, and methods for the utilization of wood waste. The laboratory work, which in the past has been conducted at a number of places, will now be concentrated at Madison, Wis., where the University of Wisconsin supplies the building and the Forest Service the equipment and the staff. Some special timber testing will be done coöperatively with the universities of California, Colorado, and Washington.

PROGRESS IN STATE FORESTRY, LEGISLATION, ETC. State action along the lines of forestry has included protection from trespass and fire, promotion of forestry, and establishment of forest reserves and organizations. Eighteen States have protective fire systems, those considered most satisfactory by experts being California, Oregon, Maryland, Washington, New Jersey, New York, and Minnesota. Twenty-five States have State forest officers, whose duties include protection and promotion.

State forests are maintained by twelve States and Territories, the area amounting to 3,270,771 acres. Of these New York ranks first, with 1,611,817 acres, followed by Pennsylvania, with 863,000 acres, Hawaii, 443,116 acres, and Wisconsin, 253,573 acres. Smaller areas are held as State forests by Minnesota, Michigan, Connecticut, Massachusetts, New Jersey, Indiana, etc. In Delaware, in co-operation with the National Forest Service, a survey is being made of the forest conditions preparatory to the perfecting of a forest policy for the State. In Hawaii co-operative studies of eucalyptus are in progress. Similar investigations are being carried on in the lower Rio Grande Valley in Texas. An investigation is being made of the forest resources of Kentucky. In Massachusetts 1330 acres have been planted to trees under the supervision of the State forest officer, and a movement has been begun for the reforestation of the numerous islands in Boston Harbor. The expense of clearing pine lands is being studied in Mississippi, where the cost varies from \$8 to \$17 per acre. In the Pacific Northwestern States the cost of preparing logged-over land for agriculture is about \$100 per acre. In Ohio a forest survey has been made of nineteen counties and tree planting operations are in progress, about 650,000 seedlings having been distributed since 1904. The last legislature appropriated \$8000 for forestry studies within the State. Vermont has provided for a State forester, and A. F. Hawes, formerly State forester of Connecticut, has been appointed to the position. In connection with quite a number of the State agricultural experiment stations, forestry investigations are being conducted.

The recent legislation in the different States has been along protective lines and upon the subject of the taxation of forest lands. The International Tax Association has considered the subject at some of its recent meetings, and some of their conclusions have been embodied in proposed State laws. They recognize the principle that forests should be taxed at their productive value rather than on their sale valuation. The Weeks bill before Congress, designed to secure forest reserves in the White and Appalachian mountains, passed the House on March 1, 1909, by a close vote, but failed of consideration in the Senate.

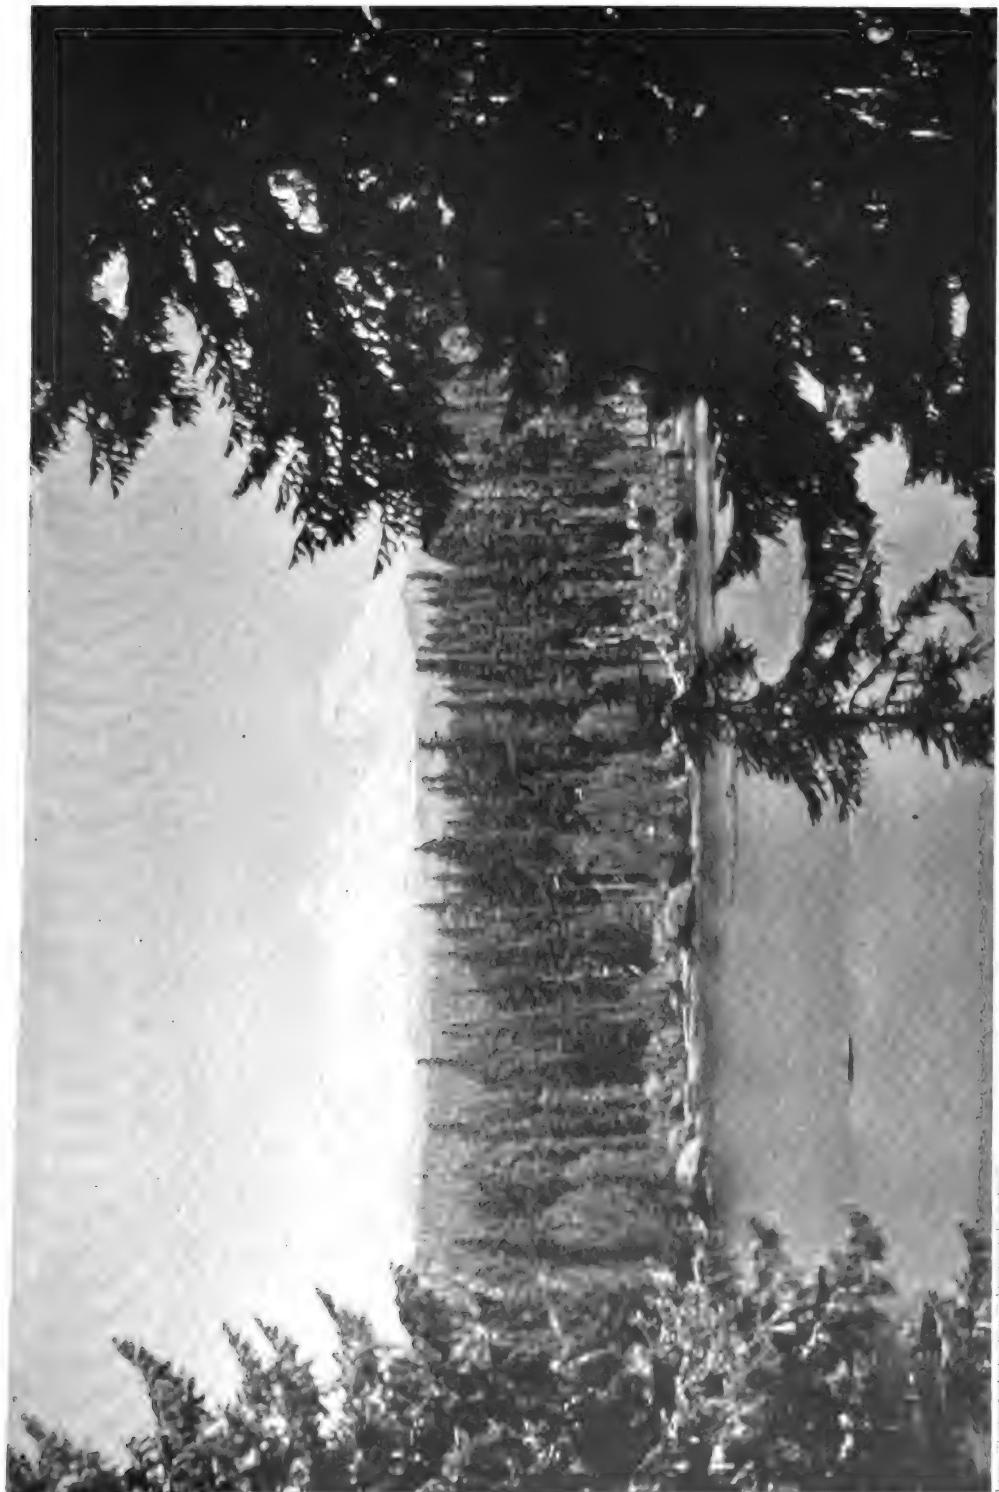

FORESTRY IN FOREIGN COUNTRIES. The present forest areas of the principal countries of the world are estimated as follows:

Country	Wooded area Acres	Per cent of total area
Sweden	54,734,614	51.9
Russia (excluding Poland)	425,564,842	34.2
Hungary	24,174,443	32.6
Germany	34,569,794	25.9
United States	550,000,000	25.0
Switzerland	2,176,907	22.0
Norway	16,845,400	21.9
Belgium	1,259,000	17.3
France	22,224,134	17.0
Italy	10,266,310	14.5
Netherlands	636,299	7.9
Denmark	682,823	7.2
United Kingdom	3,075,773	4.0
Canada	799,000,000	38.0
Australia	102,037,000	5.4
India	119,000,000	25.0
New Zealand	17,074,003	25.6
Eastern Siberia	509,000,000

Not all of the above is productive forest, nor

is it all under conservative management. Among the most productive forests of the world are those of Bavaria, which in 1906 produced a net income of \$6.74 per acre; Baden, \$3.50 per acre; Brunswick, \$3.15 per acre; and Mecklenburg, \$2.15 per acre. In India from about 60,000,000 acres under management a revenue of \$5,816,000 was obtained in 1907. In Great Britain a royal commission on afforestation has reported a planting project for reforesting about 9,000,000 acres, 10,000 acres to be planted annually. In Bavaria, steps are being taken to protect the last natural yew forest of Europe, near Munich. Germany has begun a survey of the forest resources of West Africa, Kamerun, and Togo, and the principles of scientific forestry are soon to be applied in those countries. A reorganization of the French forest service was made early in 1909. The government of Sweden has appointed a commission of experts to consider and report on a forest policy for that country. In Italy much of the forestry work is in tree planting, and in 1908 nearly 15,000,000 trees and 194,600 pounds of tree seeds were distributed for planting. One-half the cost of planting is contributed by the State, the balance coming from committees, individuals, etc. Great interest has been aroused through the planting of rubber trees to supply the waning production, and it has been estimated that fully 600,000 acres have been planted to rubber trees of all kinds in the Tropics, three-fifths of them in Ceylon and the Malay Peninsula. The government forests of Java embrace 1,865,000 acres, most of which are in teak and under definite working plans. New Zealand has a definite policy of forest planting, and since 1906 about 2500 acres have been planted annually, principally with European and North American species, the native trees being of too slow growth to make their planting profitable. Argentina has established two national parks of large extent, and the proclaiming of a forest reserve of Terre del Fuego is contemplated. An attempt has been made to determine the forest resources of Portuguese East Africa and a report on them has recently been issued. Canada at the end of 1908 had fifty-three forest reserves and national parks which embraced 128,000,000 acres. In addition, 75,800,000 acres were under timber license or lease. Canada's exports of forest products in 1908 were \$8,192,382, of which square timber and pulp wood comprised \$6,175,376. The forestry department of the Ontario Agricultural College distributed more than 400,000 seedling trees to farmers in 1908 for planting on waste lands. The government of British Columbia has established a Bureau of Forestry, with an expert at its head who is expected to look after the timber interests of the province.

FOREST SCHOOLS, ORGANIZATIONS, ETC., IN THE UNITED STATES. Graduate instruction is now offered at the universities of Yale, Michigan, and Harvard. Undergraduate courses are given at about a dozen colleges and universities and courses of lectures are provided at many of the agricultural colleges and other educational institutions. Recently Columbia University has added forestry to its curriculum. The University of Minnesota has received a donation of 2200 acres of land for experimental work in forestry. The Yale Forest School has received \$100,000 from Mrs. M. K. Jesup to found a chair of sylviculture. The University of Montana has arranged a special short course

THE THREE SISTERS FROM FISH LAKE, CASCADE FOREST RESERVE, OREGON

The timber is alpine, fir, and bull pine
FORESTRY

Printed by American Litho Co.

for forest rangers, and the men connected with Forest District No. 1 will be detailed for instruction from January to March in 1910. In Canada courses in forest instruction are provided by the University of Toronto, the University of New Brunswick, and Ontario Agricultural College. A special conference on forestry education was held at Washington, D. C., in December, with representatives of fourteen institutions present. The forest school long conducted with the Biltmore estate will be conducted as a peripatetic school in the future, part of the time being spent in Europe and part in the forests of this country.

The twenty-eighth annual meeting of the American Forestry Association was held at Washington, D. C., January 13 and 14, 1909. The subject of forest fires was given especial prominence in the programme. Secretary of Agriculture James Wilson resigned as president of the association and he was succeeded by Hon. Curtis Guild, Jr. The Canadian Forestry Association met at Regina, Saskatchewan, September 3 and 4, 1909.

Colonel W. F. Fox, for a number of years superintendent of forests of New York, died June 16, 1909. Austin Cary, assistant professor of forestry of Harvard University, succeeded Colonel Fox. Hofrath Friederich, director of the Austrian Forest Experiment Station at Mariabrunn, died late in 1908. Matsumo, the founder of modern forestry in Japan, died within the year. A forest school and forest experiment stations in connection with the University at Tokio are due to his efforts.

FORMOSA. An island about 100 miles off the China coast, formerly belonging to China, but since 1895 to Japan. The area is stated at 13,503 square miles. The estimated population in 1909 was 3,132,000, including 54,000 Japanese. The chief towns, with population at end of 1908, are Dai-Hoku, the capital, 80,226; Dainai, 52,401; Rokko, 19,442; and Kelung, 16,846. An educational system, among many other improvements, has been established by the Japanese. There are reported 153 elementary schools for natives, with 620 teachers and 23,350 pupils.

PRODUCTION AND COMMERCE. In 1909 the area under cultivation was estimated at 1,618,800 acres, of which 788,470 were in rice fields. In 1907 the rice acreage for the first crop was 536,484, and for the second 631,578; total production, 44,760,430 bushels, valued at \$22,410,000. The annual production is steadily increasing. After rice, the leading products are sugar and tea, while opium, ramie, jute, and sweet potatoes are of considerable importance. The four sugar companies in Formosa produce annually 1,580,000 piculs (of 133½ pounds each). A large part of the world's camphor supply is obtained in the forests under government monopoly. Gold and coal are the leading mining products, but deposits of silver, salt, sulphur, and petroleum are also exploited. The coal output in 1907 amounted to 134,186 tons. Manufactures include sugar, flour, oil, tobacco, spirits, iron-work, glass, soap, brick, etc.

The imports and exports of merchandise in 1907 were valued at 30,971,000 yen and 27,376,000 yen respectively; in 1908, 38,002,000 and 33,721,000 respectively. The leading imports are textiles, metal wares, lumber, tobacco, and opium. The leading export is rice, which

in 1908 amounted to 354,899,195 pounds, valued at 10,547,116 yen; almost the entire export went to Japan, or 338,311,743 pounds, valued at 10,127,957 yen. Next to rice in export value is tea, which in 1908 amounted to 23,240,947 pounds, worth 6,186,616 yen (to the United States 16,195,330 pounds, 4,441,080 yen). The camphor export declined from 4,121,566 pounds in 1907 to 3,255,507 pounds, valued at 2,615,000 yen, in 1908 (to the United States, 1,365,910 pounds, 1,052,410 yen). There are upwards of 425 miles of railway in operation, including over 125 miles of light railways. The reported number of telegraph offices is 97, with 1100 miles of line and 4000 miles of wire. Post-offices in 1907 numbered 125.

FINANCE AND GOVERNMENT. The estimated revenue and expenditure for the fiscal year 1909 balanced at 33,871,328 yen; for the fiscal year 1910, 29,951,449. Revenue consists largely of inland taxes, customs, and subsidies from Japan; expenditure is chiefly for internal administration and public works. Japanese government in Formosa began March 31, 1896. The Governor-General in 1909 was General S. Sakuma. A campaign against the aborigines has been going on for the last few years. A special force is employed against them consisting in 1908 of 1086 constables and 4930 Aiyu, the latter enlisted from the natives. By the close of 1908 it was reported that the objects of the campaign were nearly attained, the aborigines being confined to the mountain regions, but some resistance was offered in 1909.

FORTIS, ALESSANDRO. An Italian statesman, died December 4, 1909. He was born at Forti in 1842, and after studying law at the University of Pisa, he settled in Bologna and soon acquired a good practice as an advocate. He was an enthusiastic Liberal and fought under Garibaldi at Mentana, and on his return to Bologna he became a noted agitator on behalf of the Republican party, and in consequence was one of the leaders arrested at Villa Ruffi. He entered the Chamber as deputy for Forti in 1880, a seat which he retained for five successive Parliaments, until he was defeated in 1897 by Signor Fratti. He soon found another seat, however, which he continued to hold until the time of his death. He entered Parliament originally as an orthodox follower of Mazzini and a Republican, but his ideas gradually changed, and he ultimately confessed the same faith as the constitutional members who surrounded him. He became a leader of the Chamber at the head of the Moderate Radicals and attained great distinction as a politician and an orator. From 1889 to 1891 he held the post of Under-Secretary in the Ministry of the Interior under Crispi, and he did not hold office again until March, 1905, when he was appointed Premier and head of his own cabinet. The Ministry was not successful and fell at the end of the year. It was reconstituted, only to fall definitely in the beginning of 1906. Fortis did not appear prominently in politics again until the occasion of the debate at the end of 1908 on the Italian foreign policy provoked by the rôle played by Italy with regard to the Austrian annexation of Bosnia and Herzegovina. He then spoke ostensibly in support of the government, but his speech was a strongly worded denunciation of the treatment of Italy by her Austrian ally

and the spiritless part played by the Italian Foreign Office. Although Fortis was not prominent in the government of the country, he was always an influence to be counted with in the Chamber.

FRANCE. A republic of western Europe. Capital, Paris.

AREA AND POPULATION. The total area is 207,129 square miles. The total population, according to the census of 1906, was 39,252,245, or 189.5 per square mile. From 1811 to 1820 the average annual excess of births over deaths was 5.7 per thousand of the population; from 1851 to 1860, 2.9; from 1881 to 1885, 1.6. In 1903 the excess of deaths over births was 73,106. In 1904, 1905, and 1906 there was an excess of births of 57,026, 37,120 and 26,651 respectively. In 1907 the excess was again in favor of deaths by 19,920. The movement of the population in the first half of 1908 and the corresponding period in 1909 is given below:

	1908	1909
Births	411,402	398,710
Deaths	401,894	426,913
Marriages	162,495	156,294
Divorces	5,605	6,148

In some of the northern departments (first half of 1909) the births are in excess: Nord, 21,984 births, 18,629 deaths; Pas-de-Calais, 15,062 births, 10,935 deaths; Finistère, 11,536 births, 8,687 deaths. There were in 1903 8919 divorces; in 1904, 9860; in 1905, 10,019; in 1906, 10,573; in 1907, 10,938. The foreign population by nationalities in 1901 was as follows: Italians, 330,465; Belgians, 323,390; Germans, 89,772; Spaniards, 80,425; Swiss, 72,042; English, 36,948; Luxembourgish, 21,999; Austrians, 9790; others, 89,040; total, 1,033,871. The population was divided (1901) according to occupation as follows: Agriculture and forestry, 8,176,569; manufactures, 5,819,855; commerce, 1,822,620; public service, 1,297,569; personal service, 1,015,037; transport, etc., 830,643; liberal professions, 399,839; extractive industries, 266,351; fisheries, 67,772. The urban population (1901) was 15,957,190; the rural, 23,004,755. According to the census of 1906, Paris had 2,763,393 inhabitants; Marseilles, 517,498; Lyons, 472,114; Bordeaux, 251,917.

EDUCATION AND RELIGION. Education, public and private, is under control of the Minister of Instruction. Primary instruction is free and compulsory. The total number of primary schools in France in 1906-7, public and private, lay and clerical, was 83,301, with an enrollment of 5,425,444 pupils. The closing of the congregational schools in accordance with the law of July 1, 1901, increased the attendance of the public and private lay schools between 1902 and 1907 by 931,065. The number of secondary schools for boys in 1908 was as follows: Lycées, 107, enrollment 58,998; communal colleges, 227, enrollment 35,282; private institutions, lay and clerical, 619, enrollment 62,558. The secondary schools for girls (1907) were: Lycées, 47, with 16,760 pupils; colleges, 58, with 9044 pupils; secondary courses, 61, with 7046 pupils. The number of primary normal schools (exclusive of the two higher normal schools at Fontenay and St. Cloud) was 123 in 1907, with 8809 students. The Ecole Normale Supérieure prepares teachers for secondary instruction. The state

universities and special schools numbered 73 in 1908, with 39,890 students. There are scientific, technical, military, naval, commercial, musical, and fine arts schools dependent upon the various ministries. In 1906, 3.5 per cent. of the conscripts could neither read nor write. The state recognizes no religion and tolerates all creeds. Since the separation of church and state by the law of December 9, 1905, the state, the departments, and the communes have been relieved of all financial obligations toward the churches, though pensions and allowances have been granted to avoid working hardship during the transition period. The arrangements made by the government to acquire administrative control over buildings used for public worship have not been agreed to by the clergy; nor have the clergy acquiesced in the law of December 9, 1905. No definite conclusions have for that reason been reached in the matter of pensions and grants. The amount expended in 1909 was 505,880 francs, of which 318,000 was for direct assistance to the clergy and their families. Before the passing of the law (July 1, 1901,) requiring every monastic association to be specially authorized, there were 910 recognized associations, and 753 not recognized. The total establishments numbered 19,514, and the members 159,628 (30,136 men and 129,492 women). Of the 753 unrecognized associations, 305 dissolved themselves upon the passing of the law, and 448 requested authorization, which the Chambers refused in the majority of cases.

AGRICULTURE. Of the total area, 8,397,131 hectares (1 hectare = 2.47 acres) are under forests and 36,977,098 hectares are under crops and grasses or fallow. The chief product of the soil is wheat, of which France grows sufficient for her own needs and for a large export flour trade as well. The home consumption per capita is greater than in any other European country (excepting Belgium), being slightly under $\frac{7}{4}$ bushels. The vine is extensively cultivated, France being the home of Bordeaux, Burgundy, champagne, etc. The horticultural production, officially valued in 1892 at about 295,337,000 francs, increased to the value of about 398,964,000 in 1908. The principal agricultural products other than wheat, are barley, rye, maize, oats, potatoes, and sugar beet root. The vine growers numbered, in 1907, 1,601,332; the 1907 yield was valued at 965,375,906 francs. The area planted to vineyards in 1908 was 1,654,366 hectares against 1,649,157 in 1907; the wine yield amounted to 60,545,000 hectolitres (1 hectolitre = 26.417 U. S. gallons) against 66,070,000 in 1907. The acreage under vines in the Department of Marne, the champagne district, was 34,233 acres, against 34,718 in 1907. A comparative table of the production in the department by arrondissements for 1907 and 1908 is given below, showing a decrease of over 41½ per cent. in 1908:

Arrondissement	1907 Gallons	1908 Gallons
Rheims	4,295,261	1,488,237
Epernay	2,902,121	1,333,578
Vitry le Francois	437,289	390,075
Châlons	404,958	121,358
St. Menehould	4,856	7,219
Total	8,044,485	3,341,127

The cider yield in 1908 amounted to 19,976,000 hectolitres, against 3,360,000 in 1907—the

latter being the lowest figures on record. The average production for the decade from 1898 to 1907 was 16,000,000 hectolitres. The government especially encourages silk culture, which is carried on in twenty-four departments of the

Republic, Gard, Drôme, Ardèche, and Vaucluse being the most important. There were employed in this industry in 1907, 124,463 persons, against 122,045 in 1906; 188,360 ounces (of 25 grammes) of eggs were put in incubation, against 178,303 in 1906, and the total production of cocoons was 8,396,201 kilos (in 1906, 7,520,477 kilos). The number of live-stock in France on January 1, 1908, was as follows: Sheep and lambs, 17,460,284; neat cattle, 13,939,722; swine, 7,049,012; horses, 3,094,898; goats, 1,421,009; mules and asses, 552,778. See AGRICULTURE; FORESTRY; and STOCK RAISING.

MINING AND METALS. Of the 1,489 conceded mines in the Republic, 808 were in operation in 1907, with 183,900 workers. The yield of conceded mines was valued in 1907 at 625,024,301 francs; of the non-conceded, at 12,811,049 francs. The leading mineral and metal products were, in 1907: Coal and lignite, 36,753,627 tons; iron ore, 9,196,474; pig iron, 3,590,200; worked

(34,128 men, 1957 women, 1140 children), and yielding 636,832 metric tons. The production of alcohol in 1907 amounted to 2,514,810 hectolitres. See LIQUORS, FERMENTED AND DISTILLED.

FISHERIES. There were, in 1905, 95,804 persons engaged in the various fisheries, with 27,645 sailing boats of 186,030 tons, and 201 steamers of 13,874 tons. The total value of the products was 122,891,036 francs, of which the cod fisheries contributed 18,880,855 francs, the herring fisheries 13,829,036, and the sardine fisheries 10,054,367. The sardine catch in 1908 was estimated at 8,000,000 kilos, against 6,000,000 in 1907.

COMMERCE. The general commerce (which includes all goods entering or leaving France) was valued in 1907 as follows: Imports, 7,874,600,000 francs; exports, 7,256,100,000. The special trade includes only imports for home consumption and exports of French origin; the imports in 1907 were valued at 6,223,000,000 francs, and in 1908 at 6,000,800,000; the exports (1907) at 5,596,100,000 and (1908) 5,271,900,000. The chief classes of the special trade were valued in francs as follows:

	Imports		1st 9 mos. of
	1907	1908	1909
Food products	1,038,000,000	920,000,000	645,900,000
Raw materials	4,013,000,000	4,020,000,000	2,850,011,000
Manufactured goods	1,172,000,000	1,150,000,000	842,727,000
Total	6,223,000,000	6,090,000,000	4,338,638,000

	Exports		
	1907	1908	1909
Food products	747,000,000	736,000,000	563,126,000
Raw materials	1,508,000,000	1,476,000,000	113,261,000
Manufactured goods	3,341,000,000	3,059,000,000	1,978,926,000
Total	5,596,000,000	5,271,000,000	2,655,313,000

steel, 1,860,300; finished iron and steel, 580,000. There were fifty-nine smelting works in operation, with 122 blast furnaces. The production of zinc amounted to 44,113 tons; of antimony, 24,359; manganese, 18,188; lead and silver, 18,068; arsenic, 7860; copper, 2404. The output of salt was 1,225,700 tons. The quarries produced building stone, slate, cement, etc., to the value of 248,183,265 francs. Returns for 1908 give the coal output, including lignite, at 37,-

The principal imports in 1908 were wool, cotton, coal, silk, oleaginous fruits and seeds, machinery, raw skins, copper, timber, wines, coffee, rubber, cereals, and minerals. The principal exports were flour, cotton, silk, and woolen tissues, wines, silks, automobiles, raw hides, tools and metal goods, dressed skins, chemical products, pig iron, and iron and steel. The countries of origin and destination in the special trade for 1907 and 1908 were as follows:

	Imports (francs)		Exports (francs)	
	1907	1908	1907	1908
Great Britain	883,000,000	852,000,000	1,369,000,000	1,216,000,000
United States	670,000,000	741,000,000	396,000,000	321,000,000
Germany	638,000,000	626,000,000	649,000,000	641,000,000
Belgium	426,000,000	436,000,000	861,000,000	798,000,000
Argentina	287,000,000	292,000,000
Algeria	291,000,000	273,000,000	393,000,000	403,000,000
Russia	271,000,000	251,000,000	57,000,000	80,000,000
Italy	194,000,000	187,000,000	264,000,000	274,000,000
Spain	169,000,000	157,000,000	126,000,000	135,000,000

622,556 tons; pig iron, 3,412,393; worked steel, 2,743,045.

MANUFACTURES. In view of capital invested and value of annual output, the flour-milling industry is the most important in the country. The duty on flour is more than twice the duty on wheat, and except in the event of a serious crop shortage there is little opportunity under the existing laws for flour imports for home consumption. There were in 1907-8 sugar works to the number of 255, employing 37,225 persons

The figures for the 1907 flour exports are given in bags of 220 pounds each as follows: To Egypt, 848,911 bags; Turkey, 404,625; Switzerland, 384,428; Great Britain, 306,991; Belgium, 217,679; Tunis, 142,386; Free zones, 137,223; Holland, 100,151; Algeria, 60,471; Germany, 57,974; various colonies, 55,221; Spain, 47,436; Indo-China, 41,378; Senegal, 34,280; Norway, 20,448; Russia, 19,066; other countries, 154,687; total, 2,933,355. The Bordeaux wine exports for the first six months of 1909 amounted

to 10,265,904 gallons; of which Germany received 2,315,186, Great Britain 1,412,675, Argentina 1,123,991, and Belgium 1,121,983 gallons.

The imports and exports of specie and bullion for 1907 were (in francs) as follows:

	Gold	Silver	Bronze	Total
Imports	444,431,030	360,860,377	108,750	805,400,157
Exports	154,573,532	215,500,836	703,430	370,777,538

COMMUNICATIONS. The railways are nearly all conceded to companies, and will lapse to the State upon the expiration of the concession. The total length of general lines January 1, 1908, was 25,000 miles, besides 4850 miles of local lines. The total length of navigable rivers in 1907 was 7964 kilometres, of which 6986 kilometres were actually navigated; the total length of canals was 4989 kilometres, of which 4884 were in actual use. An enumeration of all vessels of over three tons' capacity engaged in inland navigation, taken by direction of the Minister of Public Works (1909), shows the total number to be 15,310, with a tonnage of 3,841,745 and carrying an aggregate of 45,559 employees. Of these vessels 2649 are foreign owned. There were in 1905 in all France 38,308 kilometres of national road. The total length of telegraph lines in 1906 was 104,770 miles, with 388,770 miles of wire. There were 17,038 telegraph offices, of which 13,073 belonged to the State; the messages carried during the year numbered 57,874,120; the total receipts amounted to 38,760,571 francs. The mercantile marine, January 1, 1908, included 15,639 sailing vessels of 662,828 tons net, with crews numbering 73,747; and 1554 steamers of 739,819 tons, with crews numbering 16,389. The total tonnage entered at French ports in 1907 was 34,489,032 tons (French, 13,929,156); cleared, 34,618,915 (French, 13,907,789). The Chamber of Commerce has under consideration a plan for joining the Loire and the Garonne regions by canalization, so that central Europe may have an all-water route outlet at Bordeaux and the Atlantic Ocean, by way of Périgueux, Limoges, Guéret Montucon, Moulins, and Dijon. A law passed by the French National Assembly (1909) provides for the construction at Havre of a special avant-port, a tidal basin, and a dry dock 984 feet long and 115 feet wide, to cost in the neighborhood of 86,528,500 francs and to be completed not later than 1915.

FINANCE. The total revenue for 1909 was estimated at 3,973,265,048 francs; the total expenditure at 3,973,035,678. The principal estimated sources of revenue were: Direct taxes, 570,187,986 francs; indirect taxes, 2,278,080,600; government monopolies, 895,944,900; various, 228,452,762. The principal classes of expenditure were: Public debt, 1,263,540,781 francs; war, 789,327,606; marine, 332,902,510; finance, 313,007,977; posts and telegraphs, 309,288,172; instruction, 274,523,286; public works, 248,609,070; interior, 126,589,558; colonies, 92,369,689; commerce and industry, 56,812,637; agriculture, 46,525,494; justice, 37,542,733; President, Chamber, Senate, 19,652,660; foreign affairs, 19,623,000; fine arts, 19,025,416; labor, etc., 14,189,289; worship, 505,800. The estimates finally voted were (including in the receipts the sum of 55,000,000 francs from bonds): Receipts, 4,005,445,069; expenditures, 4,005,224,676; surplus, 220,393.

The capital of the debt stood, January 1, 1909, at 30,394,655,240 francs, being the heaviest debt ever yet incurred by any nation in the world; the funded debt was 28,998,659,840, and the floating debt, 1,395,095,400. The interest and annuities to be paid under the various heads of the

public debt, according to the budget estimates for 1909, were as follows: Consolidated debt, 655,841,611 francs; redeemable debt, interest and amortisation, 316,036,220; floating debt, 291,862,950.

The Bank of France is the only bank of issue. Its financial situation, December 24, 1908, was reported as follows: Cash (gold, 3,488,386,000; silver, 889,846,000), 4,378,032,000 francs; portfolio, 654,938,000; advances, 700,525,000; securities and real property, 256,111,000; capital and reserves, 225,018,000; notes and circulation, 4,954,658,000; accounts current, 575,489,000. The number of postal savings banks in operation in 1906 was 7883, with total deposits during the year of 512,294,958 francs. The total number of depositors, January 1, 1908, was 3,977,755, and the total amount, including interest at 2½ per cent., due depositors on that date was 1,338,729,192 francs. The municipal and private savings banks at the close of 1904 numbered 550 principal and 1461 branch offices, with 7,422,326 depositors and deposits amounting to 3,246,117,046 francs.

There is a double standard of value, gold and silver, the ratio being theoretically 15½ to 1. Of silver coins, however, only the 5-franc piece is legal tender, the free coinage of which has been suspended since 1876. The franc, the monetary unit, is worth 19.3 cents. It was announced in 1909 that the French government had decided to coin for the first time 25- and 10-centime pieces (fractional currency) made of aluminum to take the place of the old copper coins, which are to be withdrawn from circulation. The nickel 25-centime piece will not be withdrawn.

NAVY. The larger vessels of the effective navy were as follows in 1909: First-class battleships: six of 14,865 tons each; one of 12,728 tons; one of 12,205 tons; one of 11,924 tons; second class battleships: one of 11,986 tons; one of 11,882 tons; one of 11,824 tons; three of 11,260 tons each; one of 10,983 tons; one of 10,581 tons; one of 8948 tons; first-class armored cruisers: one of 13,844 tons; one of 12,750 tons; three of 12,550 tons each; one of 11,270 tons; four of 10,000 tons each; three of 9516 tons each; second-class armored cruisers: three of 7735 tons each; one of 6300 tons; one of 5365 tons; two of 4750 tons each. In 1909 there were building six first-class battleships of 18,320 tons each and two first-class armored cruisers of 14,000 tons each. The number and displacement of effective war ships, built and building, of 1000 or more tons, and of torpedo craft of 50 or more tons, were as follows in 1909: Battleships of 10,000 tons and over, 23, aggregating 323,450 tons; coast defense vessels, 10, of 59,140 tons; armored cruisers, 23, of 220,732 tons; cruisers over 6000 tons, three, of 24,036 tons; cruisers 6000 to 3000 tons, 12, of 48,505 tons; cruisers 3000 to 1000 tons, five, of 11,766 tons; torpedo-boat destroyers, 72, of 26,672 tons; tor-

pedo boats, 259, of 24,270 tons; submarines, 96, of 28,335 tons; total, 503 war vessels, aggregating 766,906 tons. In 1909 parliamentary investigation into the condition of the navy revealed much extravagance, negligence, and confusion. In the ten-year period from 1900 to 1910 the expenditure on the French navy amounts to about \$628,500,000, and on the German navy about \$590,700,000; yet in tonnage, if not in effectiveness, the French fleet has been surpassed by that of Germany. The investigation showed that armaments for new battleships were not ready long after the ships themselves were completed, that many guns were so defective as to cause the abandonment of firing practice, that not only were there huge stocks of condemned shells, but that shells of the same pattern were still being manufactured, that there was no graving dock capable of accommodating the new battleships, as the credits voted for new docks had been spent elsewhere. See paragraphs on *History*.

ARMY. Personal military service in France is compulsory for all citizens between the ages of twenty and forty-five, and involves two years with the colors, eleven years in the reserve of the active army, six years in the territorial army and six in its reserve. The soldiers of the reserve and territorial army are called out for periodical training. The active army has about 590 battalions (163 regiments) of infantry, thirty battalions of chasseurs, twelve foreign battalions, twenty-four battalions of zouaves, twenty-four of Algerian Tirailleurs and five of African light infantry, or in all about 685 battalions. The cavalry comprise thirty-one regiments of dragoons, twenty-one of chasseurs, fourteen of hussars, thirteen of cuirassiers, six of chasseurs d'Afrique, and four of Spahis; each regiment divided into five squadrons. The artillery, which was to be increased, consisted of 433 field batteries, fifty-two horse batteries, twenty-six mountain batteries and 109 foot (or fortress) batteries. The engineers included twenty-six battalions and three railway companies, with signal and telegraph corps, aeronautical divisions, etc. The military train had twenty squadrons of seventy-two companies. The strength of the active army by arms was as follows:

	France	Algeria and Tunis
Infantry	332,845	43,200
Cavalry	56,764	8,450
Artillery	76,936	3,875
Engineers	12,250	1,118
Train	10,560	1,850
Total	489,355	58,493

In addition there were 2200 non-commissioned officers and 13,000 men of the administrative troops, 4000 unattached officers, 420 officers and 3220 men in the military schools, and 2400 officers and men supernumerary. This made a peace strength for the active army of 22,000 officers and 553,782 men, with 120,474 horses. There was in addition a gendarmerie of 683 officers and 24,034 men. The active army is divided into twenty corps, each of which occupies one of the military districts into which France is divided. Each military district is (generally speaking) divided into eight sub-divisions. Each corps is usually made up of two divisions of in-

fantry, one brigade of cavalry, one brigade of artillery, one battalion of engineers, and the appropriate administrative auxiliary troops. The headquarters of the corps are at Lille, Amiens, Rouen, Le Mans, Orleans, Chalons-sur-Marne, Besancon, Bourges, Tours, Rennes, Nantes, Limoges, Clermont-Ferrand, Lyons, Marseilles, Montpellier, Toulouse, Bordeaux, Algiers, and Nancy. In addition there are a colonial corps in Tunis and the troops attached to the military department of Paris.

The French Reserve comprised 245 three-battalion regiments of infantry with skeleton organization, thirty battalions of chasseurs, forty regiments of cavalry, forty-one squadrons, and 216 batteries. The territorial army comprised 145 regiments of infantry, seven battalions of chasseurs, forty-two squadrons of cavalry, about 100 batteries, twenty battalions of engineers, and various miscellaneous civil and other troops.

The decreasing birth rate was affecting the army of France and the annual contingent drawn for service was found to be diminishing in numbers. From 215,000 in the period 1896-1905 it fell to 210,000 in 1908 and was estimated at 207,000 for 1909 and at 204,000 for 1912. This reduction was considered as bound to work eventually a decrease in the effective strength of all the army corps. The peace strength of the army in 1909 was stated at 22,000 officers and 553,782 men (56,110 in Algeria, 20,000, of which one-third are native, in Tunis), and 120,474 horses. There was in addition a gendarmerie of 683 officers and 24,034 men. The mobilized field army of France would consist of 725,000, the First Reserve of 475,000 and the depots of 625,000. The organized territorial army was estimated at 550,000 and the unorganized at 700,000. In other words the total war effective of the French army was estimated at 2,350,000 with resources from which a million additional could be drawn for service.

In France, as in other European countries, a reorganization of the artillery was commenced during 1909. By the terms of the law of July 24, 1909, an increase as well as reorganization was provided for, to take effect within two years, though the four-gun battery was retained. The scheme called for forty-two coast and forty-seven fortress batteries, 619 field batteries, twenty-one Rimailho 6-in. field howitzer batteries, fourteen mountain batteries, and sixteen horse batteries. For colonial service, there were to be eight coast, fifteen field and four mountain batteries. The increase in the number of batteries thus provided was 128, for officering which the infantry was being drawn upon. The Chamber made special appropriations, \$6,500,000, towards the cost of new ammunition. The army estimates for 1909 amounted to 696,454,265 for the troops at home, 66,049,443 francs for extraordinary expenses and 37,371,242 francs for the colonial troops.

GOVERNMENT. The constitution of the Republic vests the executive authority in a president, elected by the National Assembly for seven years, and assisted by a cabinet responsible to the Chambers. The legislative power devolves upon the National Assembly, composed of the Senate and the Chamber of Deputies. The members of the Senate (300) are indirectly elected for nine years; those of the Chamber of Deputies (584), by universal suffrage for four years. The President (1909), Armand Fallières, was born November 6, 1841, and was elected

January 17, 1906. The Cabinet, July 24, 1909, was composed as follows: Premier, Minister of the Interior and Public Worship, Aristide Briand; Foreign Affairs, Stephen Pichon; Finance, Georges Cochery; Justice, Louis Barthou; Public Instruction, M. Doumergue; War, General Brun; Marine, Admiral Boué de Lapeyrière; Commerce and Industry, Jean Dupuy; Public Works, Posts, and Telegraphs, Alexandre Millerand; Colonies, Georges Trouillot; Agriculture, M. Ruau; Labor, M. Viviani.

HISTORY

THE MOROCCAN QUESTION. The government was interpellated on the subject of Morocco on January 15. On this occasion M. Delcassé criticised the Moroccan policy and M. Jaurès asked the government to present a definite plan and demanded the publication of General Lyautey's report containing certain proposals made to the government. Upon M. Pichon's refusal on the ground that this was not the proper time to explain the basis of the government's policy as furnished by the report and that the government would set forth the facts later, M. Jaurès presented the arguments for an obligatory arbitration between France and Germany and demanded that France renounce any sort of ambitious designs in Morocco. On behalf of the government it was said that the time had not come for France to back down before Germany in Morocco. M. Pichon presented an outline of the policy that had been pursued. The Chamber supported the government by a vote of 380 to 98 in a resolution declaring its confidence that the government would "pursue in Morocco the policy of collaboration and civilization dictated by its interests, traditions, and agreements, and by the engagements undertaken at Algeciras." The Moroccan credits were passed on January 18 by a vote of 459 to 67. In criticism of M. Jaurès it was urged that he seemed oblivious of the fact that France and Morocco had a common frontier of 1000 km., that he seemed to wish the withdrawal of troops, the non-intervention of France, and the recall of General Lyautey. M. Regnault was sent on a mission to Fez in January to discuss the question of indemnity and the conditions of evacuation. The chief event in Moroccan affairs during the year was the signing on February 9 of the agreement between France and Germany which will be discussed in a separate paragraph. In general the programme of the French government as outlined in M. Pichon's answer to the arguments of M. Jaurès was the restoration of order in Morocco. M. Pichon declared that the government would continue its work of familiarizing the Moors with European civilization while respecting their customs and their national independence, and he referred to the valuable work done by Great Britain and Russia toward keeping the European peace. The credit which the government asked for was ultimately granted. Early in March it was reported that twenty-five deserters of German origin had been sentenced for trial at Oran to varying terms of penal servitude ranging from two to eighteen years and in the case of the leader to twenty years' penal servitude and twenty years' expatriation. In the spring a Moroccan mission under El Mokri arrived in Paris to discuss the points at issue between the two countries, including the questions as to French evacuation, as to the satisfaction of French pecuniary claims, and as to a loan.

Protracted negotiations followed. In October General d'Amade, the hero of the Moroccan War, fell into disfavor with the government on account of an interview in a French newspaper in which he declared frankly that the Spanish operations in Morocco were injurious to France. (See SPAIN and MOROCCO, paragraphs on *History*.) It was necessary, he said, that Algeria should have an outlet to the Atlantic through her zone of influence in Morocco, and that she must make haste or the central route, that is from Ujda to Rabat by way of Taza and Fez, would be lost, and that Taza was to France what Fashoda was to England in Upper Egypt. For this indiscretion he was temporarily deprived of his command and placed on the unemployed list. Negotiations with the Sultan for settlement of points at issue dragged along through the last half of the year. On August 14 the French government informed the Sultan's representatives that it would evacuate the Shawia region and Casablanca as soon as the Maghzen organized an effective force for the policing of those regions and a police service on the Algero-Moroccan border, and paid its debts and reimbursed the cost of the French military operations. In the course of a debate on the Moroccan question which began on November 23, M. Pichon referred to the perfect accord between France and Spain and the latter's complete justification for her action at Melilla; and gave warning to the Sultan that he must not violate the terms of the Act of Algeciras, and that while France would remain loyal to its decisions and abstain from military enterprises she would not relinquish her hold on the Shawia and Casablanca without satisfactory assurance that her claims would be satisfied. The negotiations had gone on long enough. The Chamber voted confidence—433 to 68.

FRANCO-GERMAN AGREEMENT. The agreement between France and Germany in regard to Morocco was signed on February 9. Its purport was as follows:

"The government of the French Republic and the Imperial government of Germany animated equally by a desire to facilitate the execution of the Act of Algeciras, have agreed to indicate precisely the meaning they attach to its clauses with a view to avoiding all cause of misunderstanding between them in the future.

"Therefore the government of the French Republic, completely bound to the maintenance of the integrity and independence of the Sherifian Empire and resolved to safeguard economic equality and in consequence not to impede German commercial and industrial interests therein,

"And the German Imperial government seeking only economic interests in Morocco, recognizing on the other hand that the political interests of France therein are closely bound up with the maintenance of order and internal peace, and being therefore resolved not to hamper these interests,

"Declare that they will not take or encourage any measure of a sort to establish an economic privilege in their favor or in favor of any Power whatsoever, and that they will endeavor to associate their nationals in business enterprises of which they may obtain the concession."

The agreement was well received in both France and Germany. In France it was taken as an assurance that Germany would desist

Retiring Premier

from her irritating diplomatic tactics of the past four years. Great resentment had been felt in France at what seemed to be a deliberate intent on Germany's part to embarrass France in her Moroccan policy. No move had been made by her without a display of ill-feeling in Germany, and fear of German hostility had caused France to make mistakes and neglect opportunities. There was considerable comment on the clause providing for economic co-operation. This was, however, only a reasonable concession to Germany under the circumstances, according to French opinion, for France had gained much in securing from Germany the admission of French political interests in Morocco to which she had hitherto demurred. Moreover, there was no reason why the two countries should not be associated in such enterprises as might be made the subject of concession. There had been such co-operation in the Ouenza enterprise. In criticism of this clause it was remarked that no such arrangement was included in the Anglo-French accord of 1904, and that economic equality was not extended to all the nations. On February 16 the Kaiser telegraphed his satisfaction with the agreement to the German ambassador in Paris. On May 22 the Hague Tribunal rendered its arbitral judgment in the affair of the Casablanca deserters. The difficulty had arisen, it will be remembered, in 1908, when some of the soldiers of the Foreign Legion, including three Germans, were arrested by the French gendarmes. Employees of the German consulate in Casablanca resisted this arrest, and a struggle took place between them and the gendarmes. Later the German consulate demanded the release of the three Germans. When the affair came to the notice of the governments concerned, the French government immediately made it known that it was ready to submit the case to the Hague Tribunal. Germany, however, demanded from France an expression of regret before the case was submitted for arbitration. France refused this, but proposed a simultaneous expression of regret by both governments, which was accepted by Germany, and the protocol for arbitration was signed in Berlin on November 24, 1908. The arbitral award decided the theoretical questions in favor of France. In general it held that the consular jurisdiction did not extend over the men of the consul's nation who were serving in a foreign army occupying the consular district, that is to say, the French Foreign Legion. On the other hand the course of the French gendarmes was blamed as too summary, and it was held that a less offensive means of withholding the German consul's excess of his authority should have been employed. This decision satisfactorily terminated the matter. The French government showed its good will by pardoning the deserters in July. See ARBITRATION, INTERNATIONAL.

The award was criticized in certain quarters as offering a compromise rather than settling definitely and decisively a question of international law. It put an end, however, to a quarrel which a few months before had dangerously exasperated public opinion in the two countries.

POSTMEN'S STRIKES. By far the most important question in internal politics during the year arose from the strike of civil servants against the government. Two of these

strikes occurred among the postal telegraph and telephone employees. The first was declared on March 13.

On March 12, 300 employees in the postal service entered the central offices of the Paris Telegraph Department to declare their disapproval of M. Simyan, the Under-Secretary of State for Posts and Telegraphs. The removal of M. Simyan was demanded. On March 13, about 1200 men in the Telegraph Department went on strike as a protest against the administration of M. Simyan and as a proof of sympathy with the men who had made the demonstration the day before. From Paris the strike spread to other centres, and the confusion in the postal departments was at first very serious. On March 17, it was estimated that 3,000,000 letters were awaiting delivery in Paris, and for a whole week France was virtually without a postal system. The telegraph service was also interrupted, and for a time telegraphic communication with London practically ceased. The chief grievance had been the decision of the Ministry as to the promotion of civil servants in the postal department. The main question involved in the affair, was the right of civil servants to form trade unions and go on strike. Hitherto Parliament had left this question to the Ministry, which had always held that nothing like trade union action could be allowed to civil servants. The limits of the latter's rights, however, were not fixed precisely, and a bill as to their status was at this time before the Chamber. The specific demands of the strikers were that the Under-Secretary, M. Simyan, who had made himself especially obnoxious to them, should resign, and that after the strike no one who had participated in it should be punished or disciplined. The strike ended on March 23. The strikers felt that they had won the victory, the government having agreed not to punish strike offenses, and having made certain promises which the strikers interpreted in their favor. They believed that M. Simyan would soon resign, although the Ministry merely left the question of his status to Parliament. On March 30 M. Simyan explained his course to the Chamber and received a vote of confidence, 417 to 67. The postmen promised to await patiently the redress of their grievances. They soon threatened, however, to begin a new strike unless M. Simyan was dismissed. The government was inclined to change M. Simyan's status from Under-Secretary of State in the Ministry of Posts and Telegraphs, to that of a Minister responsible to Parliament, but it wished to make the change in its own time and not under compulsion. The postmen now declared that they would present their ultimatum to M. Clemenceau, but the latter refused to receive them. At a large meeting of workingmen, including some civil servants organized by the General Confederation of Labor, and held at the Hippodrome on April 4, a resolution was passed asserting the unity of the interests between government employees and the proletariat. When the new strike was under discussion a meeting of railway employees in Paris declared that they would support the postmen if they went on strike. Meanwhile, on May 3, fifty-three post-office employees were dismissed for making revolutionary speeches, and on May 8 seven postmen, who had been suspended from duty, were summoned before the disciplinary court. This led to a Socialist interpellation in the Chamber, where the government defended its

course. The discussion was not finished, however, and was deferred to the 13th. Meanwhile, on May 11, the postmen, angered by the hostility shown to their cause by the Chamber during the debate, declared a general strike. On May 13, the Chamber resumed its debate on the dismissal of the postmen. M. Jaurès accused the government of breaking its promise to dismiss M. Simyan, and of dismissing some of the postmen for a mere expression of opinion. M. Barthou, on behalf of the Ministry, declared that the postmen to whom M. Jaurès referred had abused the privilege of speech and M. Clemenceau attacked M. Jaurès for encouraging the revolutionary element. The Chamber voted confidence in the government, declaring that civil servants had no right to strike. From the first the strike showed no such proportions as had been expected by the postmen, and as early as May 15 it was manifestly on the decline. As soon as the strike was declared, the government dismissed 228 employees, and on May 15 it dismissed 313 more. During the previous strike, owing to the enterprise of the government and of private business men, a fairly good postal service was improvised. The Chambers of Commerce had set up post-offices of their own, and a government officer was placed in charge of the cancelling of stamps. Special associations of commerce set up branch post-offices and business men supplied their own employees for postal service. The government and the Chambers of Commerce were fully prepared for the May strike. The Chambers of Commerce had provided a postal service of their own employees, and the employers' unions were ready to assist. A large number of automobiles were ready to carry the mails. During the May strike the Paris Chamber of Commerce handled about 200,000 letters a day for eight days. During the March strike public sympathy had been largely with the strikers. This was not true of the May strike, which from the start was almost a complete failure. There were some acts of violence and many telegraph and telephone wires were cut. Only 1500 to 2000 men, however, out of 26,000 employees, left work. Although the General Confederation of Labor came to the postmen's assistance with a proclamation of a general strike on May 18, it was too late. The Confederation's proclamation had slight effect, for the strike was then practically over. Realizing this the Confederation ordered a return to work on May 21. A Socialist resolution for amnesty to the postmen dismissed during the strike, was lost by 338 to 141 (May 28). The government, however, finally reinstated them, which led to criticism in the Chamber in August. The government's reply to this was that they had taken back only those whom their chiefs recommended.

IMPORTANT ISSUES INVOLVED. The May strike was less effective than the strike in March, but more revolutionary in tendency, showing an advance in the programme of syndicalism. The civil servants had real grievances to complain of. The chief of these was the activity of politicians in civil service, as under the American "spoils system." There were evidences of favoritism, irregular promotion, and other abuses. The servants of the state included among them school teachers, workmen in the state arsenals and factories and on state railways, and numbered more than a million voters. Although the right to strike was denied in

theory, unions had actually been formed among these civil servants as in private industries, and this policy had been encouraged under republican ministers. As a matter of fact, the May strike was actually the fourth strike attempted by civil servants. The logical result of this would be syndicalism, that is to say, government by the unions, and this was the great menace of the country at the time. A "statute of functionaries" was drawn up and laid before Parliament with the design of doing away with the abuses which the postmen complained of, and of protecting their essential interests against politicians. The chief representative institution of syndicalism in France was the General Confederation of Labor which thus far had not allied itself with the Socialists. (See SOCIALISM.) The working class numbered about 9,000,000, and of these only 900,000 were organized, 300,000 were in the 2500 unions affiliated with the General Confederation, and about 100,000 were classed as revolutionaries. The specific grievances of the postmen had to do with the delay in the normal promotion as the result of certain new measures on the part of the authorities, and also with certain acts of favoritism. In the debates during the March strike, the government took its stand on the principle that a civil servants' strike was inadmissible, and the Chamber resolved that such a strike was not to be endured and expressed its confidence that the government would restore peace in the service. The government also declared that there had been no favoritism shown in the service. During the whole affair the Chamber repeatedly voted confidence, and on July 15 rejected by a vote of 284 to 177, an amendment offered for the purpose of securing the reinstatement of the civil servants dismissed during the strike. There was, however, evidence of great dissatisfaction throughout the country with the political abuses in the service, especially the matter of patronage. The trade unions urged the civil servants not to trust Parliament's promises and to reject the proposed law as to the status of functionaries. The extremists among the postmen's associations were in communication with the Confederation of Labor, but the rank and file were not fully decided in favor of syndicalism. At the end of November it was announced that associations representing over 180,000 civil servants had decided to form a national federation. See STRIKES AND LOCKOUTS.

CRITICISM OF THE NAVAL ADMINISTRATION. During the first part of the year the press teemed with complaints of irregularities and inefficiency in the naval department. It was said that the criticism of Admiral Germinet as to the lack of readiness for war which had caused his reprimand in December, 1908, was well founded. On March 25 on the discussion of the credit of 30,000,000 fr. asked for by the government for the Marine, M. Delcassé criticised the government's use of naval appropriations in recent years and demanded a Naval Commission of Inquiry. Such a Commission was voted, to consist of thirty-three members, and the appointment was made in April. The Naval Commission had its headquarters at Toulon and was under the presidency of M. Delcassé. Anticipating the report of the Commission, M. Doumer published articles on the demoralization of the fleet in which he said it was without "men, guns, or projectiles," that

15,000 ton battleships of the *Patrie* type had not carried their full complement, and that one of them, which had been in commission for nearly a year, had not fired a shot, being unable to get ammunition. At the end of June the report of the Commission was published. It condemned the practice of sanctioning the building of ships before the plans had been decided on. It referred to hundreds of alterations that were made in the original contracts for the six vessels of the *Danton* type. It blamed the successive ministries for their lamentable failure to secure competitive bids for boilers, for lack of diligence and foresight in allowing the steel shell ammunition to fall short, for negligence in failing to put through the programme for the modernization of the ports and dock yards, except in a few particulars, and the almost complete failure to provide docking facilities for the new large battleships. The Chamber was asked for a vote of censure. The report further declared that the arsenals were not in readiness to carry out the work of construction and repair fast enough, that lower prices would be secured if contractors were not obliged to assume risks, and in general that the system showed too high a degree of centralization. The Commission urged that many matters requiring prompt attention should be decided by the commanders-in-chief and the maritime prefects. It recommended that the central body be reorganized and that the head of each department should execute the measures agreed upon under the general supervision of the Minister of Marine. Meanwhile the newspaper criticism continued. The Comptroller-General complained of carelessness in the supervision of food supplies, and in April it was reported that petty officers of the naval commissariat and a contractor had been arrested for supplying food of inferior quality. There were conflicting reports as to the plans for an enlarged navy. One *Dreadnought*, that is to say, a warship of the *Danton* type, was launched in January. Two others were launched in April, and three more were on the stocks. It was reported in the newspapers that the plans for increasing the navy contemplated 45 ships of the line, 12 scout cruisers, 60 large destroyers, and 64 submarines, to be ready by 1920. The cost of building the armored vessels, which were to be completed within the next ten years, was estimated at \$600,000,000.

MINISTERIAL CRISIS. The Clemenceau Ministry, which had held office longer than any other under the Third Republic, came to an end in consequence of these criticisms and exposures. A debate began in the Chamber on the reading of the report, and finally on July 20, M. Picard, the Minister of Marine, made a speech explaining the government's course. M. Delcassé, president of the Naval Commission, sharply censured the ministries of the last few years as responsible for the present conditions in the navy. In a bitter debate which followed between him and M. Clemenceau, the latter remarked on the inappropriateness of such an attack coming from the man who had brought the country to the humiliation of Algeciras without means of defense, and M. Delcassé in reply defended his course, pointing to the agreements with Spain, Italy and England as a result of his policy, and condemning Clemenceau in turn as the president of a former Naval Commission,

who had nevertheless permitted these abuses to develop. He also declared that it was not he who ought to be ashamed of Algeciras, but the persons whose relentless criticism had so frightened the country that it had yielded to the commands of another Power. There was much excitement in the Chamber, and finally on the question of confidence, the vote stood 212 to 176 against the government, which thereupon resigned. Many of the deputies had gone for the holidays, and out of the 591 only 388 voted, 175 being absent on leave. The defeat was interpreted as a personal overthrow of Clemenceau rather than a condemnation of the government's policy.

THE NEW MINISTRY. A new ministry was formed, known as the Ministry of "Republican Conciliation," under the premiership of M. Briand, President of the Council, and Minister of the Interior and of Public Worship. Five members of the old Ministry were retained in the new, namely, M. Viviani (Labor), M. Pichon (Foreign Affairs), M. Barthou (Justice), M. Doumergue (Public Instruction and the Fine Arts), and M. Ruau (Agriculture). (See above, paragraph on *Government*.) To the new Chamber, which met on July 27, the new Ministry declared that its programme rested on the principles of "peace, reform, and progress," fidelity to existing alliances, and the furtherance of naval reorganization. As to specific measures, it referred to workingmen's pensions, the income tax, the statute of functionaries, and tariff revision. The Chamber voted confidence by 306 to 46.

In August the new Minister of Marine announced that he was preparing a law for the reconstruction of the French navy. He declared that he personally was in favor of the creation of five squadrons, each with eight units, that he did not favor armored cruisers and would order their construction suspended, but that he did approve of torpedo boats and submarines. He also declared that he would put an end to the practice of detailing sailors to miscellaneous shore duties instead of keeping them on board ship. In the same month changes were made in the distribution of the fleet. The vessels in Moroccan waters were to constitute a single division. A single division was also to be formed out of the vessels in the Far East and the Pacific, and the Mediterranean and Northern Squadrons were to be known respectively as the First and Second Squadrons.

PARLIAMENT. Partial elections to the Senate were held on January 3. They comprised thirty-two departments. The general results were favorable to the Radical government. Sixty Radicals and Radical Socialists were returned, 27 Republicans of the Left, 9 Progressists, 5 Conservatives, and 2 Independent Socialists. The elections in 15 constituencies, early in March, returned to the Chamber 4 Radicals, 1 Republican Socialist and 1 Independent Socialist. There were signs of Socialist gains throughout the country. Parliament met on January 12 and M. Brisson was elected president. The most important debates in January were on the amnesty bill, the income tax, and on the interpellation of the government by Mr. Jaurès in regard to Morocco, which is described in a preceding paragraph. The amnesty bill concerned the granting of pardon to the workingmen arrested on account of the strike riots of September, 1908. The Conserva-

tives demanded amendments granting amnesty to reactionaries, and the Left contended for amendments extending it to anarchists and anti-militarists, but the amendments were rejected and the bill was passed by 470 to 6. The debates on the income tax were resumed on January 19. Progress on it had been and continued to be slow. In two years only 53 of the 97 clauses had passed. Clause 64 concerned the taxation of foreigners, and was discussed on February 2, and the Minister of Finance, M. Cailleaux, agreed to a reduction of income for foreigners residing in France, from ten to seven times the rental. On March 9 the income tax bill passed the Chamber by a vote of 406 to 166. On behalf of it it was said that it reduced the burden on small land owners and small shopkeepers, and did away with a number of antiquated and burdensome taxes, such as the taxes on doors and windows. Day laborers were to be exempt and the tax on incomes over 5000 francs was to be progressive up to 4 per cent. Foreign residents were to be taxed four times as heavily as before, their incomes being estimated at seven times their annual rental. There was no chance of its passing the Senate in its present form. The tariff question came up before Parliament early in the year. (See article TARIFF.) The Customs Committee proposed an increase on between 800 and 900 classes of imports. This caused some uneasiness in foreign countries, to allay which it was said on behalf of these changes that they would impose a surcharge on foreign goods of only \$5,000,000, which, owing to changes in foreign tariffs since 1892, the surcharge on French exports was nearly \$10,000,000. Early in March it was announced, after a conference between the Customs Committee and the Ministry, that the new scale would impose on British imports a surcharge of only 4 per cent., and would not affect 87 per cent. of the classes of goods imported, and that, as regarded other countries, the new tariff scale levied only half of the additional duties which those countries had by their tariff changes imposed on French exports. In the course of a tariff debate, which began on June 28, it was urged in favor of revision that it was a necessary measure of self-defense, that Germany was evading the Treaty of Frankfort, which accorded the French the most favored nation treatment, and that during the last three years, while French exports to Germany were declining, German exports to France had considerably increased. On October 16, at a meeting of the Cabinet, M. Dupuy, Minister of Commerce, urged the acceptance of the Chamber's Customs Committee's proposals, which would tend to bring the duties on certain articles down to date, but the rejection of some of the proposed increases. The subject was still under discussion when the new Ministry came into power. For nearly two years a committee of the Senate had been engaged on the Chamber's Workingmen's Pension bill, and in February it offered a substitute measure. This proposed a pension of 120 francs for members of the working classes 65 years of age or more, to be provided by employers, who were to pay annually 9 francs for every employee over 18 years of age, and 4 francs 50c. for those under. It also provided for an old age pension system, based on monthly payments by employers and employed, as a result of which workingmen

would receive considerably more than they paid in. (See OLD AGE PENSIONS.) The amount to be paid in annually was three francs between the ages of 15 and 18, and from that time on six francs. A Railway Servants' Pension bill was also passed fixing the age limits of the traveling staff, the station staff and the administration employees at 50, 55 and 60 years, respectively. The Statute of Functionaries submitted by the government guaranteed the promotion of civil servants without the interference of political influence, and permitted state employees to form unions, but not a confederation which should include different departments.

The new Ship Subsidies bill was introduced and debated on June 2. It sanctioned the agreement of the government with the Messageries Maritimes, whereby the state guaranteed new loans of capital for construction, and reserved in return the right to share in the profits under certain conditions. This was opposed by the Chamber as a menace to private shipping, and in July the question of a convention with the Messageries Maritimes was referred by the Chamber to the Budget Committee, after a resolution was passed, declaring that companies applying for subsidies must be under state financial control, must give the state a share in the profits, and must be subsidized in proportion to earnings. The Senate granted the amnesty for strike offenses in June. During the same month the budget was presented.

To meet the deficit for 1910 new taxation and short term bills were proposed. But the proposals of the new Ministry which were made known in September were more radical. They looked to the raising of the whole amount by new taxes.

On October 2 the Chamber began the discussion of proposals of electoral reform submitted by members. The government was disinclined to initiate any sweeping measure of proportional representation, but was said to be considering the introduction of a bill for proportional representation in elections for municipal councils in towns of more than 50,000. In the following month an attempt to overthrow the government on the question of the new taxation proposed in the budget was checked by the prompt demand of M. Briand of a vote of confidence, which was granted.

On November 8 the Chamber accepted the principle of the *scrutin de liste*, and of proportional representation as embodied in the first clause of the electoral reform bill, but upon the threat of the Ministry to resign if the discussion of the measure continued, the assembly voted against the clause. The electoral question was prominent at the close of the year, which turned on the relative merits of the two electoral systems, the *scrutin de liste* and the *scrutin d'arrondissement*, the latter system being the one that now prevails. This divides each department into single member districts or arrondissements, and each voter votes for the single candidate of his district. Under the former system of the *liste*, the voter cast his ballot for all the candidates of the department. This system prevailed in 1871-1876 and in 1885-1889.

RELATIONS WITH THE CHURCH. Some Catholic criticism was occasioned by the appointment on March 2 of the Abbé Loisy to the Chair of Religions at the Collège de France, which was

formerly occupied by M. Réville. Cardinal Andrieu and other prelates were fined for condemning the use of certain text-books in the schools or for attacking the government in their public addresses. Early in September the Roman Catholic deputy, Abbé Gayraud, interpellated the government on its policy toward the Catholics. This threatened to bring up the question between the Church and the state in the autumn session. Toward the end of the month, M. Briand attended, contrary to the practice of Republican ministers hitherto, the funeral services of the victims of the *République* disaster at the Versailles, which was taken as a sign of a conciliatory attitude; but in October the archbishop and bishops of France issued a pastoral letter in regard to the schools which lamented the disappearance of the free schools in which Christianity was taught, and told the people that it was their right and duty to choose such schools as gave the religious instruction which they desired for their children. The public schools or so-called neutral schools excluded religious training, and this in the opinion of the ecclesiastics discredited religion. In his speech of October 10 M. Briand declared the government policy to be one of conciliation and tolerance, and he said that the government had assured the Church of sufficient funds for the clergy and public worship in spite of the obstinacy of the Church authorities, which had prevented them from gaining full possession of the endowments. The Archbishop of Toulouse demanded the complete restoration of religious teaching in the schools. In his reply to the Church manifesto as to the schools, M. Briand declared that the government had taken effective measures to defend the neutral schools, but that the best defense came from the teachers themselves and from the French spirit of national independence, which would resent this attack on the school system, inspired by a foreign power. On November 18 the Pope in an address to the French pilgrims attacked the French government for its persecutions of Catholicism as shown by its proceedings against Bishop Andrieu and other bishops, by the state monopoly of schools and by the threatened legislation to insure the protection of irreligious teachers.

OTHER EVENTS. Serious disturbances arose in the Department of Oise in consequence of the strike of the button makers. The labor demonstrations of May Day passed off without serious disorder. On the occasion of the May strike, the Railwaymen's Union of France, and the Colonies, threatened to strike if the old age pensions measure was not passed, and a strike occurred on the Corsican railways. In consequence of a seamen's strike on May 24, six mail steamers were unable to sail for Tunis and Algiers. For a time there was a risk of stopping the movement of the greater part of the merchant marine. Later, however, the trouble subsided. In June a strike riot occurred at the race meeting at Auteuil, occasioned by the Stable Boys' Union, which had been formed in affiliation with the General Confederation of Labor, and some of the buildings were burned. At the end of June the seamen's strike in the merchant marine came to an end, but there were threats of its resumption. On March 30 the treaty with Canada was under discussion in the Senate. In May the Beatification of Joan of Arc was celebrated at Com-

piègne with effective pageants. The fiftieth anniversary of Mistral's *Mircille* was celebrated at Arles, beginning with torchlight processions on May 28. Features of the affair were the unveiling of the poet's statue, a speech by Mistral himself, and the founding of a Provençal museum out of Mistral's Nobel prize money. The Carnegie gift of \$1,000,000 for French heroes was accepted by the government, which announced that it should be called the Carnegie Foundation. An earthquake occurred on the night of June 11. It extended over a wide area, including all the French Mediterranean coast and was felt in Spain and Portugal. It was most severely felt at Bouches-du-Rhône. Fifty-five persons were reported killed, and the village of Saint Cannat was destroyed. M. Bompard, formerly Ambassador at St. Petersburg, was appointed to succeed M. Constans at Constantinople in June. The Nancy exhibition was opened by M. Barthou, the Minister of Public Works, on June 10. The bicentenary of Malplaquet was celebrated on September 12 by leading French citizens, and a memorial column of stone made by the sculptor Theunissen, engraved with flags and the portrait of Villars, was erected. Disturbances occurred at Hazebrouck in the Department of the Nord, and a workingman's house was wrecked. In April the button strike was arbitrated, but without avail, and by the end of the month it became general. In his speech at the unveiling of the Gambetta statue at Nice on April 25, M. Clemenceau referred to the nation's peril in the present emergency and said that France would perish if she allowed public servants to interrupt its service by acts of violence. The General Confederation of Labor, under the influence of its revolutionary element, appointed August 30 for an anti-militarist congress. The anti-militarist movement appeared to be gaining strength, and as proof of its effectiveness, the fact was cited that the number of young soldiers who failed to join the colors increased from 4567 in 1906, to 11,782. This was attributed to the agitation in large towns where the General Confederation of Labor had distributed among the troops many thousands of anti-militarist pamphlets. There were many complaints of espionage in the latter part of the year. These cases were under investigation early in September. Swarms of spies were said to infest the eastern and frontier districts. It was suspected that the recent theft of a machine gun could be traced to German sources, and that the gun was actually in the possession of German military authorities.

The bad condition of the Paris streets, owing to the slackening of the work of improvement and of repaving, was the subject of much complaint, as was also the condition of the telephone service. M. Millerand, the new Minister of Public Works, declared his intention to reform the Paris telephone service. In the summer the Duke of Orleans started on the *Belgica* for the coast of Greenland, to continue his soundings of 1905. The King of Italy was chosen as arbitrator in the dispute between France and Mexico, as to the sovereignty of the Clipperton Islands. The Czar, who visited Cherbourg on July 31, was cordially received and presents and compliments were interchanged. The deserters from the Foreign Legion at Casablanca were tried and

found guilty, but pardoned. French colonial expansion in Africa was illustrated by the successful military operations at Adrar which added to the prestige already gained by the French arms in that region, by the capture of the capital of the Wadai district. The execution of Professor Ferrer (q. v.) by the Spanish government, occasioned much agitation in France (see SPAIN, paragraphs on *History*), and a serious riot occurred in the neighborhood of the Spanish Embassy, in reply to an interpellation of the government, on the subject of Professor Ferrer, by the Socialists, M. Pichon, the Foreign Minister, declared that the execution was purely a domestic concern of the Spanish government, and that France had no right to interfere.

During the latter part of the year public attention was drawn to the very sensational murder trial of Mme. Steinheil, charged with the killing of her husband and mother in May, 1908. It was held before the Assize Court in November, and resulted in acquittal. The case was of especial importance in calling attention to the need of reforming French judicial procedure. The Council of Ministers on November 25, signed a decree for an extra-Parliamentary Commission to study the question of reform. M. Barthou, in his report to President Fallières declared judicial procedure out of date, complicated, and ill-adapted to the discovery of truth. The commission, which began its sittings November 27, drafted a measure for submission to the Chamber. It proved that a preliminary statement of the charge should be made by the public prosecutor, proposed the abolition of cross examination by the presiding judge, and drew up rules as to the examination of witnesses in States:

court. For an account of the Socialist movement in France, see SOCIALISM. For a description of the French colonial possessions, see separate articles under their respective titles. See also ARBITRATION, INTERNATIONAL; STRIKES AND LOCKOUTS; TARIFF; FRENCH LITERATURE; STOCK RAISING; DRAMA; PAINTING; SCULPTURE; AERONAUTICS; and the various articles on industries.

FRANKLIN, SAMUEL RHOADS. A rear-admiral (retired) of the United States navy, died February 24, 1909. He was born in York, Pa., in 1825, and was appointed midshipman in 1841. He served throughout the Civil War, and took part in many important engagements, including the bombardment of the forts at Sewall's Point. In 1863 he was fleet captain of the West Gulf blockading squadron, and he took part in the naval operations in Mobile Bay in 1865. He was made captain in 1872, commander in 1880, and rear-admiral in 1885. He was superintendent of the United States Naval Observatory in 1884-5, and commander-in-chief of the European station 1885-7. In the latter year he retired after forty-six years of service, most of which were spent at sea.

FRATERNAL ORGANIZATIONS. A title applied to those secret societies which maintain a death, sickness, or accident fund for their members. Many of these societies are under the surveillance of the State insurance departments, which exact from the governing bodies such statistical information as tends to check betrayal of trust. The following are the principal organizations of the kind in the United States:

	Date of foundation	Membership
Ben Hur, Tribe of.....	1894	107,903
B'nai B'rith, Independent Order of.....	1843	35,164

FRENCH ACADEMY. See ACADEMY, FRENCH.

FRENCH CANALS. See CANALS.

FRENCH CONGO. A French possession (total area, 669,280 square miles; population in 1906, 10,000,000), extending along the west coast of equatorial Africa, between the Belgian Congo and the German Kamerun colony. By decree of February 15, 1906, it is divided into four circumscriptions forming three colonies: The Gabun Colony (capital Libreville), with an area of 120,745 square miles and a population of 4,000,000; the Middle Congo Colony (capital Brazzaville), area 170,255 square miles, population 3,000,000; and the Ubanzi-Shari-Chad Colony (capital, Fort-de-Possel), area (Ubanzi-Shari) 154,400 and (Chad) 223,800 square miles; population (Ubanzi-Shari) 2,000,000 and (Chad) 1,000,000. The Chad region is for some purposes administered as a territory. The natives are mostly negroes. There are fifty-three mission schools, with about 3600 pupils. The natives cultivate manioc; the Europeans, coffee, vanilla, and cacao. Valuable woods are found in the forests, as is also rubber. The Mindouli mine produced 1500 tons of chalcosine in 1906, valued at about 450,000 francs. Other minerals found are gold, copper, and iron. The imports (cotton goods, spirits, ammunition, tobacco, rice, salt, etc.) were valued in 1907 at 15,162,000 francs (France, 6,899,000 francs); the exports (ivory, rubber, cacao, coffee, ebony and other woods, gum-copal, and palm-oil), 19,594,000 francs (France, 9,216,000 francs). A railway is projected to connect Libreville with the Congo. The total length of telegraph line in operation is 870 miles. There were (1906) thirty-nine post-offices. In 1906, eighty-two vessels of 118,306 tons entered, and ninety-seven of 117,528 tons cleared, at the ports, of which Libreville is the chief. The revenue and expenditure for 1909 (general budget) balanced at 6,877,000 francs, against 6,434,985 in 1908. The estimated expenditure of France on the French Congo in 1909 was 3,502,313 francs. The debt stood at 1,706,000 francs. The military force consists of 4177, of whom 322 are Europeans. The Middle Congo Colony is governed by an administrator-in-chief, the others by lieutenant-governors, all under the control of the Commissioner-General (M. Merlin in 1909), who is assisted by a secretary-general and a council of government.

The state of Kanem, northeast of Lake Chad (capital Ma'd), and Wadai (capital Abeshr; area about 170,000 square miles), are included in the French Congo.

HISTORY. The government was criticised for maintaining in its Congo possessions practically the same system that Belgium was so severely blamed for maintaining in her Congo dominions. This criticism was acknowledged by those familiar with the conditions to be well founded, but assurance was given that the system would be abandoned as soon as that in the Belgian Congo disappeared. Considerable progress was made in the construction of the railway from upper Congo to the central African lakes, and it was expected that communication with Katanga would be opened by the end of next year.

FRENCH GUIANA, or CAYENNE. A French colony and penal settlement on the northeast coast of South America. Area, 34,061 square miles; population, (1906), 39,117. In

1907 the penal population numbered 6140. Capital and only seaport, Cayenne, with 12,426 inhabitants. There are twenty-four primary schools, with about 2230 pupils, and a college at Cayenne. Only about 8800 acres are under cultivation. The crops are corn, rice, manioc, cacao, coffee, sugar-cane, and tobacco. Gold-mining (placer) is the principal industry. In 1907, 139,059 ounces were declared for entry at Cayenne. Silver, iron, and phosphates are also mined. The imports and exports for 1907 were valued at 14,013,078 and 12,331,702 francs, respectively. A few roads connect the capital with the interior. There were (1906) twenty-one post-offices. A mail steamer from Martinique touches at Cayenne once a month. In 1907, 247 vessels of 46,764 tons entered at the port. The local budget for 1908 balanced at 3,497,304 francs. The expenditure of France (budget of 1909) was 6,494,523 francs, of which 6,221,800 was for the maintenance of the penal settlement. The outstanding debt (1907) was 76,000 francs. The Bank of Guiana has capital, 600,000 francs; statutory reserve fund, 300,000. The colony is administered by a governor, (M. Rodier in 1909), assisted by a privy council of five members. There is a council-general of sixteen members, and the colony is represented in the French Parliament by one deputy.

FRENCH GUINEA. A French colony in French West Africa (q. v.), lying on the coast between Portuguese Guinea and Sierra Leone. Area, 92,249 square miles; population (1906), 1,497,770. Capital, Konakry (about 7000 inhabitants), on the Isle of Tombo. There were in 1906 seventeen government schools, with 1400 pupils; and seven mission schools, with 220 pupils. The chief products are palm oil and nuts, millet, ground nuts, gum, rubber, and coffee. Futa Jallon raises cattle; Bouré and Siké produce gold (16,864 grammes, valued at 42,160 francs in 1906). Imports (1907), 16,344,215 francs; exports (mainly rubber, cattle, ground nuts), 15,989,746. Length of railways open to traffic (1908), 136 miles; under construction, 220 miles. The railway from Konakry to the Niger is nearly completed as far as Koumii—186 miles. A highway runs from Konakry to the Niger. There are 1512 miles of telegraph line. There were in 1907 31 post-offices. In 1906, 470 vessels of 474,554 tons entered, and 443 of 465,519 tons cleared at the ports. The local budget (1903) balanced at 4,036,000 francs. A lieutenant-governor (C. M. Liotard in 1909) administers the colony, under the direction of the Governor-General of French West Africa.

FRENCH INDIA. The French possessions in India have a collective area of 198 square miles, and a population, 1908, of 273,185; (1906, 277,723; 1891, 282,923). Pondicherry (area 111 square miles, population, 1908, 174,456), the chief of these dependencies, is on the Coromandel coast, 85 miles from Madras. The town of Pondicherry has 46,887 inhabitants. The fortifications—once strong, but destroyed in the war with England—must not be rebuilt, and the French are allowed to maintain a garrison sufficient only for police purposes. The minor settlements are Chandernagore (area 4 square miles, population 26,831), on the Hooghly, 17 miles from Calcutta; Karikal (area 51 square miles, population 56,595), in the Kauvery delta; Yanan (area 9 square miles, population 5005) in the Godaverry delta; and Mahé (area 23

square miles, population 10,298), on the Malabar coast. Rice and pulse are cultivated. The chief industry is cotton spinning, for which there are four mills employing about 5000 hands. In 1908 the sea-borne imports were valued at 9,989,100 francs, and the exports at 27,293,450. The chief exports are ground nuts, cotton goods, and oilcakes; the imports, raw cotton, cotton goods, seeds, and pulse. There were 30 miles of railway in 1908, connecting Pondicherry and Karikal with the South Indian Railway. In 1907 398 vessels of 782,705 tons entered, and 387 of 785,819 tons cleared at the three ports—Pondicherry, Karikal, and Mahé. The estimated revenue for 1909 amounted to 2,083,940 francs, of which 252,250 francs was contributed by France. Outstanding debt, January 1, 1907, 795,963 francs. The colony is represented in the French Parliament by one senator and one deputy. There is an elective general council. The Governor in 1909 was F. E. Leveque.

FRENCH INDO-CHINA. A French dependency in southeastern Asia, consisting of five states: Annam, Cambodia, Cochinchina, Tongking, and Laos (qq. v.). The capital is Hanoi, in Tongking (population 103,238). The collective area is estimated at about 309,979 square miles, and the population (1906), largely of the Annamite race, at 16,315,063, inclusive of about 15,500 French. The whole country is under a governor-general (1909, A. Klobukowski), assisted by a secretary-general. Each state is administered, according as it is a protectorate or a direct French colony, by a resident-superior or a lieutenant-governor. French Indo-China has been rapidly developed since 1893 by the construction of public works, by the influx of capital and enterprise, and by the reorganization of the finances. Its financial and political unity was finally established in 1898. Rice is the most important article of production; corn, pepper, silk, cotton, tea, sugar and tobacco are raised. The total output of the mines in 1907 was valued at 4,502,000 francs. The amount of coal and lignite produced was 320,000 tons; zinc ore, 6000; antimony, 310; tin and wolfram, 128; gold, 58 kilos. About one-fifth of the foreign trade is transit trade passing to and from the Yunnan treaty "port" of Mengtz through Tongking. The total imports amounted in 1908 to 287,388,425 francs; exports 244,102,325. The chief articles of export were valued in 1907 as follows: Rice, 154,416,000 francs; tin, 12,812,000; fish, 11,538,000; cotton, 11,243,000; pepper, 6,431,000; corn, 4,052,000; coal, 3,967,000; skins, 3,679,000. The principal imports are metal manufactures, cotton manufactures and yarns, jute bags, liquors, machinery, petroleum, silk goods, paper, and opium. The total length of railways open to traffic, December 31, 1908, was 809 miles, total trackage, 1084 miles; the cost of construction is estimated at 130,337,052 francs. The lines under construction or projected have a total length of about 530 miles. All the railways belong to the government. The length of telegraph lines is reported as 8438 miles, with 284 offices. There are 269 post-offices. In 1907, 2718 vessels of 2,138,319 tons entered, and 2770 of 2,142,225 cleared at the ports. There is a common budget for the whole dependency, and a separate budget for each state. The general budget, which in 1909 balanced at 75,081,400 francs, provides for military and judicial services, public works, and other matters common to the states as a whole.

The revenue is from customs, government monopolies, indirect taxes, posts and telegraphs and railways. The outstanding debt, January 1, 1907, amounted to 392,557,000 francs. There is a French Bank of Indo-China. The French budget for 1909 provided 13,209,529 francs for Cochinchina and 24,113,117 for Annam and Tongking, principally for military purposes. The military force in 1909 consisted of 12,042 Europeans and 14,492 natives. Two brigades were stationed at Tongking and one at Saigon in Cochinchina. The naval force consists of 1 armored battleship, 3 armored cruisers, 3 protected cruisers, 4 torpedo-boat destroyers, 1 armored gunboat, 12 torpedo-boats, 4 submarines, and a number of small craft, manned by about 4500 men.

HISTORY. A punitive expedition was reported at the end of January, as undertaking the suppression of the pirates which infested the Wen-te district and the restoration of order in that region. On July 25 a fight occurred with the pirates in which, according to the reports, the French having made a tactical blunder, suffered considerable loss, namely, 13 killed and 11 wounded, including a captain who died later. Afterwards the French blew up a redoubt inflicting a loss upon the rebels estimated at 25. In February the French Parliament authorized a loan of \$11,000,000 on the Yunnan Railway.

FRENCH LITERATURE. In comparing the year 1909 in French literature with the two preceding years, one realizes once more the specially close relation between social and literary life in France. While 1907 and 1908 were still echoing the great internal struggles of the Dreyfus affair and of the question of separation of Church and State with all the social problems connected indirectly with them (France's *Jeanne D'Arc*, Bourget's *L'émigré*, Frapié's *Figurantes*, etc.,) the year 1909 is distinctly a year of general good will; writers endeavor rather to understand the standpoint which is not theirs than to judge it and pass condemnation. Everybody is willing to make concessions and suggest concessions. The amount of literature which is not didactic has grown; and such works written for the mere entertainment of the reader are often among the very best. Only in one domain an exception might be made: the political uneasiness in Europe has caused the patriotic note to be sounded in connection with the question of Alsace and Lorraine in several novels of a rather fighting spirit.

DRAMA. As the drama in 1909 is treated more fully under a special heading, need we only recall a few of the most important productions of the French stage. The *théâtre à thèse* is in favor with the great playwrights. Herivel's *Connais-toi* is a plea for moral indulgence, reminding one of Molière's *Misanthrope*, except that the hero is not a ridiculous Alceste, but a really superior man, so good himself that he cannot believe in human weakness until he sees his own beloved wife threatened by sin; then he understands and forgives. H. Bataille's *Scandale* is another play with humanitarian tendencies. Devore's *Page blanche* is a warning to well-intentioned but blind parents who bring their children up in ignorance of the ways of the world. Wolf and Leroux in *Le Lys* suggest rather advanced views, i. e., that a woman who does not marry might be allowed compensation in free love. Among psychological dramas the most discussed were Trarieux's *La*

dette and A. Herman's *Trains de luxe* (a study of wealthy foreigners in Paris). Excellent comedies are Lavedan's *Sire*, Capus's *L'oiseau blessé*, Renard's *La Bigote*, R. de Flers' *L'âne de Buridan* (a not over-intelligent young man to whom every woman takes a fancy), Bernière's *Papillon dit Lyonnais le juste* (a story of inheritance). Sensational was the famous *Arsène Lupin*, Leblanc's detective drama. Special mention must be made of R. Fanchois's *Becthoven*, a musical drama showing the musician betrayed in his love, by nature (becoming deaf) and in his family affections, but on his deathbed consoled by the apparition of his immortal daughters, the nine symphonies. Jean Richépin made a poetic drama of Demolder's exquisite *Route d'Emeraude*, a novel of Dutch life. Joan of Arc has inspired a drama to Em. Moreau, which was acted by Sarah Bernhardt. The Comédie Française has taken up Brieux's *Robe rouge* (1901). Verhaeren has published his two dramas, *Philippe II.* and *Le Cloître*. The whole world has mourned the death of Coquelin Aîné (January 22) and of Coquelin Cadet (February 8).

POETRY. There has been some good and original fanciful poetry, for instance, *Cent ballades* by Jaubert, a lively revival of the old ballad of Villon and La Fontaine, or P. Courtois's *De l'aurore au clair de lune*, in which appear all the popular characters of French songs, Pierrot, Marlborough, Cadet-Roussel, Polichinelle, Pandore, La Palisse, etc. In general, however, the poets were in earnest moods. We note a decidedly ethical, even Cornelian attitude towards life, meant evidently as a reaction against the Nietzschean attitude. A. Droin's *Le collier d'Emerande* and V. E. Michelet's *L'espoir merveilleux* both praise strength and energy, not in order to crush the weak, however, but to fight our lower passions. A. Delacour, in *Le bon de soi*, preaches the virtue of self-sacrifice, especially in family life; marriage ought to be a means to rear children, not a mere means of egoistic happiness for parents. E. Hollande, the excellent poet in *La vie passe*, combines poems destined to bring comfort to those struck hard by destiny, with poems of dignified resignation in the style of Vigny. An original attempt is made by E. Blémont, in his *Beaux rêves* to express poetically and mythologically the dreams of the praises of people; as the warlike nations have created gods that express their aspirations, or as agricultural people, like the peasants of Russia, have given to their saints a specific character, so our workingmen classes ought to inspire a new folklore to modern poets; call it superstition or imagination, the popular mind delights in creating poetical legends; the poet must beg to express them.

A clever and amusing skirmish between progressives and conservatives in the realm of poetry ought to be mentioned. The editor of the international review *Poésia*, in Milan, M. Marinetti, publishes a manifest "d'une violence culbutante et incendiaire" (they are his own words) in favor of up to date poetry; he will sing the noisy modern railroads and "les gares gloutonnes avaleuses de serpents qui fument," the "automobile rugissante qui a l'air de courir sur de la mitraille," the somersault, fighting in all its forms, including "la gifle et le coup de poing," victories that will be greater than the victory of Samothrace; he sings *Futurism*.

When the Paris *Figaro* reproduced this exciting document, poets were aroused and protested, Misral among others. The best retort is that by the French review *Poésie* in Toulouse opposing *Primitivism* to *Futurism*, i. e., the beauty from the earliest time of human history, as well as modern beauty. This counter-manifest is well worth reading.

So far the movement called "regionalism," i. e., protest against the idea that Paris alone could inspire literature, was confined to novel-writing. This year we have it in poetry, not only in such volumes as Verhaeren's *Villes à pignons* (*Toute la Flandre*), but in collections like Van Bever's *Poètes du Terroir*, Vérain and Gaubert's *Anthologie de l'amour provençal*, and Jean Amade's *Anthologie catalane*.

Among the increasing number of women poets, no new original talent has been revealed. Mme. Delarue Madrus sings in *La figure de Proue*, the proud Normans sailing south, and finding among those conquered by them the revelation of a world of the mind and of art. Mmes. de Sormion in *Vie triomphante*, Dortsal in *Le jardin des dieux*, and Barratin in *Heures de brume*, all could adopt as motto the latter's line "Sois la grande croyante et la grande ouvrière." Mme. Picard's *La Fresque* is a belated production in the style of early symbolism. Three poets who were at one time stars of the Parnassian School, died: C. Mendès (by a railroad accident); A. Mérat (by suicide), and Jean Lahor. Léon Dierx, elected a few years ago by his colleagues in France "Prince des poètes," for thirty years a modest clerk at the Ministry of Public Instruction, has now retired on a pension of \$240 a year.

THE NOVEL. It is here especially that the large output referred to at the beginning is noticeable; there was, however, no sensational success. Discrimination and classification is no easy matter; still let us try: Among the novels of the ordinary type, but which are above the average value in point of art, one may quote: R. Bazin's *Mariage de Mlle. Ginnel, dactylographe*, and Lichtenberger's *Un drame de cœur*. The latter has also *Petite*, one of those child stories that made his reputation. Of the so-called psychological novels, probably the most admired by connoisseurs has been A. Gide's *La Porte étroite*. It could be defined as story of protestant love asceticism. Two young people, sincere, earnest, with the highest aspirations, bring about their own unhappiness by this very excess of conscience; they consider that not happiness but sanctity is the goal of life, and they torture themselves atrociously, until finally the girl pretends that she does not love and then dies of her sacrifice, while the young man learns of her saintly deceit, after her death, by a diary. Paul Margueritte's *La flamme* relates the agony of a man who sees his dearly beloved wife gradually yielding to nervous prostration; both her and his tortures are minutely described, and how in his deep need of human affection, the man seeks consolation elsewhere, but in vain. Romain Roland's *Antoinette* is the story of a touching devotion of a sister to her brother. The strongest naturalistic novel is J. H. Rosny's *Marthe Baraquin*, a girl in a large city's slums, struggling against the worst, the most hopeless of nauseating conditions. The end is less gloomy than in other novels from the same pen. Let us now come to the very numerous "romans à thèse." Marcel Prévost

in *Pierre et Thérèse* discusses the ethics of the modern business man who considers the law an impediment to the free development of his individuality and therefore feels no remorse in breaking it. His wife, Thérèse, an excellent woman, with a mind not broad enough to view things in this light, does feel remorse, but is overawed by the prestige of the powerful man. Géniaux, in *Forces de la vie* offers a somewhat similar case. Two men with modern ideas establish a flourishing industry in Bretagne, face to face to the Celtic monuments, respected with a sort of superstition as the sacred witnesses of a past which one ought not to violate. In spite of the vigorous opposition of bigot peasants and sentimental artists they succeed.

The vigorous dialectic of the author will render somewhat uneasy those who think that, in Europe, only the past has a right to existence. C. Nisson's *Cadet* relates a case of struggle between the prejudices of old nobility against modern life, while Guet's *Victoire* tells strikingly the story of a workingman who, taking advantage of modern means of self-education, rises to the position of owner of a great industrial undertaking; but at the same time he loses contact with his own people, his wife deserts him, no longer understanding him. The divorce problem was approached in a new way by two excellent writers: suppose free love be adopted, which is meant to better conditions for women, what would happen? E. Rod in *Les Unis* shows a father who does not marry, but simply "unites" his daughters to men; now, the latter no longer feeling bound by law, the one deceives his wife, the second robs her, and the third ill-treats her. L. Lefebvre in *Le couple invincible* studies the case of two good people absolutely devoted to each other, and depending upon each other absolutely; but even then the results are bad; as they are not married, the woman lives in constant fear lest something may happen to break their happiness; she suffers more than an unhappily married woman. René Boylesve in *La jeune fille bien élevée* shows the tragic results of a too lofty education, as it creates expectations which life does not fulfill. Another group is that of patriotic or chauvinistic novels. Maurice Barrès's extremely artistic *Colette Baudouche* is one of the best books of the year. A typical German professor comes to Alsace with pan-Germanistic ideas, but he is won over to the other side by the distinction and refinement of the conquered people, especially by the charming Colette; the latter, however, does not complete her work of conversion, for when the professor proposes to her, she declares that the country in mourning stands between them. Aderer, in *Le drapeau de la foi* treats a similar case in connection with the Franco-Prussian war. The "regionalist" movement has inspired a deeply moving picture by E. Bouloc, in *Les Pâris* (peasants); they are the peasants who, thanks to the French Revolution, became landowners, and now at the cost of great sacrifices and energy, try to remain true to their farms and struggle against the tendency to leave the country for the city life. H. Bordeaux's *La Croisée des chemins* is a work of sentimentalism, and unbearable moralizing character. As a counterpart to those national novels, there are some which point out defects of modern French society: In *L'or*, V. Margueritte gives a striking description of the love for Mammon invading the different strata of

society. Vignaud's *La Passion de Claude Bernier* shows the vain attempt of a politician who for a long time struggles to get to the top honestly. The poet, L. le Cardonnel writes a witty satire on *Les Soutiens de l'Ordre*, priests, magistrates, judges, all canvassing, arranging, cheating. At the end an old man, satisfied that all those people who talk so much are simply deceiving the poor, throws, in disgust, in the box a ballot where the name of a candidate is replaced by the word of Cambonne. We pass rapidly exotic novels, like Loti's *La mort de Philæ* (in Egypt) or Nolly's amusing *Hien le Maboul* (in Annam); novels discussing the oriental question and struggle of races, like Farrère's *La bataille* (showing admirably how the Chinese and Japanese quietly take advantage of our mania for civilizing them, in order to get ready and oust us one day with the arms we procure them); historical novels, like E. Daudet's *La course à l'abîme* (time of the Terror); G. d'Esparbès's *Le vent du boulet* (history of a soldier of Napoleon I.); Herman's *Confidences d'une biche* (supposed memoirs of the Second Empire); scientific novels, like J. Clarétie's *L'obsession* (a case of double personality); novels depicting theatrical life, like Ginisty's *Françine*; but it will not be out of place to mention specially Ohnet's *Mariage Américain*, with a first-class captain of industry of Yankee origin; the book is bristling with all sorts of exciting adventures, and is a fine specimen of a "rattling" story with nothing to it. Tinseau's *Sur les deux rives* is an infinitely superior production, drawing an interesting parallel between France and Canada, not always to the disadvantage of the latter.

The usual embarrassing crop of novels by women: a remarkable wealth of talents with a no less remarkable lack of original philosophy. Mme. Marni's really strong *Souffrir* adds one more to the list of novels in which women, miserably crushed by brutal, untrue, cowardly men, are angels of courageous abnegation and resignation. Mme. Nerval's *Ciel rouge* is a case of the same nature, a woman having made a bad choice; she finds consolation in the company of a delicate young poet, who is then slain by the husband, and the wife, for the sake of the child, consents to live on with the murderer. D. Lesueur's *Le droit à la force* maintains that a woman has a right to have recourse to might against the inevitable brutal man, when law does not protect her. By none of these writers the really interesting problem is treated: why—at least in their works—such capital women invariably marry such capital fools or brutes. But this literature shows that writers of both sexes agree at least on one point, i. e., that woman is certainly the most interesting half of humanity.

Many volumes of short stories of unusual interest: H. Rosny in *Nymphée* has two prehistoric love stories, in Asia and in Africa, based on thorough anthropological researches. Frapié publishes a volume called *M'amé Préciat*, realistics as usual. Haraucourt's *Trumaille et Péllicire* are two stories, the first of a peasant, envied and persecuted because he is more successful than his neighbors, the second (which reminds one of Flaubert's *Cœur simple* in treatment) tells of a poor harmless husband, henpecked by a terror of a wife, who finally drives him insane. Anatole France also touches the feminine question from the man's point of

view, but he strikes the note of satire instead of drama. In *Les sept femmes de Barbe bleue et autres contes merveilleux*, he claims to have discovered a document giving the true story of Bluebeard, who was shamelessly slandered; the real fact is that he was the sweetest and most unfortunate husband, who could not find a decent wife; the whole trouble was that he loved his wives too much and they took advantage of his shyness: The first was showing bears at a fair before she made him marry her, the second was a drunkard, the third smelled of onions, the fourth was too hospitable, the fifth was a fool, the sixth a liar, and the seventh a cruel being who finally had him slain by her brothers. Needless to say they were shrewd enough to lay all the blame at the door of their victim. The lighter vein in short story was also adopted in Kahn's *Contes hollandais* (Dickens's style), in Bergerat's *Contes de Caliban* (a sort of wager in the Boccaccio manner to tell risky things with such art that they become exquisite); Keim tells fantastic stories in his *Contes hypothétiques*. A posthumous work of Villiers de l'Isle Adam, *Derniers Contes* (romanesque and wild) must also be mentioned. Very entertaining are Tristan Bernard's *Véillées d'un chauffeur*. The prix Goncourt went to the brothers Marius and Ary Leblond, for their volume *En France*.

MEMOIRES. None particularly important this year. The following deserve, however, to be named. Bauchard, *Les événements de 1870-71*, memoirs of the Commune, by a grown boy. Mme. Alphonse Daudet, *Souvenirs d'un groupe littéraire*, Fr. Coppée's *Souvenirs d'un Parisien* (in the "Annales").

LITERATURE. Of special importance are: Brunot's 3d Vol. of *Histoire de la langue française*. Bédier's 2d Vol. of his *Légendes épiques*. G. Boissier's *L'Académie française de l'ancien régime* (posthumous work). The period of Romanticism is much studied both in reviews and books, e. g., Souriau, *Népomucène Lemercier*; Séché, *Cénacle de la Muse française*; Boulenger, *Marceline Desbordes Valmore* (in which we learn that her famous Olivier was the poet Latouche). Of Mérimée's friend are published some *Lettres de l'Inconnue*. The posthumous works of Baudelaire were issued. Doumic has a *George Sand*, Ferney an *Hippolyte Taine* (crowned by the Academy), Jean Dornis an *Essai sur Leconte de Lisle*, J. Bertaut, *La littérature féminine d'aujourd'hui*.

Famous dates were commemorated. Among others the bicentenary of Port Royal. Great festivities were organized to celebrate the 50th anniversary of Mirville's publication, and Mistral's statue was dedicated at Arles in presence of the original. The fourth centenary of Calvin's birth was the occasion of a world manifestation in honor of Protestantism, Ex-President Roosevelt being the honorary president of the Committee of the Monument of the Reformation. Paris celebrated the 50th anniversary of the first volume of Victor Hugo's *Légende des siècles*. No end of monuments were erected, to Du Bellay, to Regnard, to A. de Vigny, to Barbey d'Aurevilly, to Guérin, etc., etc.

The FRENCH ACADEMY has received the following members: Aicard, Brieux, Charmes, Doumic, Poincaré, and Prévost.

FRENCH SAHARA. By a convention between Great Britain and France, the former recognized the right of France to all territory

west of the Nile basin, which practically includes the entire desert of Sahara (exclusive of the Libyan Desert), and the State of Wadai. The French Sahara may be roughly estimated at a million and a half square miles and the population at 800,000. A line of posts for the safeguarding of caravans extends from Cape Blanco on the Atlantic to the oasis of Bilma, north of Lake Chad. Bilma is an important source of salt and sends most of the output to the Sudan.

There is a Bank of West Africa, with a capital of 5,835,000 francs and reserve funds of 254,000.

FRENCH SOMALI COAST. A French protectorate lying between Eritrea and British Somaliland on the Gulf of Aden. Capital, Jibuti (population about 11,000, of whom 500 are Europeans). Area 46,320 square miles; population of the Danakil, or the Somali race, 208,061. A mission school for boys and one for girls were opened at Jibuti in 1902, with 50 pupils. The industries are insignificant, with the exception of the coast fisheries. The imports (principally cotton goods), which are chiefly in transit to Abyssinia, amounted in 1907 to 15,855,647 francs, of which 3,950,218 came from France; exports (chiefly coffee, ivory, and hides), 23,091,018 francs, of which 1,406,607 went to France. There were in 1908 193 miles of railway. Much of the traffic which formerly passed by way of Zailah and Aden now goes by the Jibuti-Harrar Railway, which has been open to traffic since December 26, 1902, between Jibuti and Diré-Dawa, the station for Harrar proper. There are four post-offices. The local budget for 1908 balanced at 1,191,800 francs. The estimated expenditure of France on the protectorate for 1909 was 562,500 francs. In 1907 (exclusive of Arab and Indian craft), 218 vessels of 375,793 tons entered, and 218 of 376,392 tons cleared, at Jibuti. The country is administered by a governor assisted by a privy council. The Governor in 1908 was M. Pascal; the envoy to the Emperor Menelik of Abyssinia, M. Brice.

FRENCH WEST AFRICA. A dependency of France divided into colonies, etc. (decree of 1904), as follows: Senegal, French Guinea, Ivory Coast, Dahomey, Upper-Senegal-Niger, Mauritania (territory), and the Military Territory of the Niger (qq. v.). The total area is estimated at 1,510,514 square miles. Population (1906), 8,811,849. A uniform system of education has been devised, under the supervision of a director of education for the whole of French West Africa. Over 10,000 children are receiving elementary instruction; the expenditure on the schools for 1908 was estimated at 1,252,000 francs. The imports (94,801,549 francs in 1907), are chiefly food-stuffs, textiles, and beverages; the exports (79,763,395 francs), fruits, oils, and oil seeds. There were (December 31, 1908) 970 miles of railway. A general budget has been created, to be estimated by the Governor-General in council, which applies the funds derived from the customs and navigation duties of the constituent colonies to the expenses common to all. The separate colonies have at their disposition, therefore, only their internal revenues; on the other hand, they have been relieved of many expenses which have been transferred to the general budget. Provision is also made therein for subventions to colonies

in need of financial assistance. The general budget for 1909 balanced at 82,175,000 francs, against 51,592,000 in 1908. The expenditure of France on the entire territory amounted, according to the budget for 1909, to 15,340,387 francs, mainly for military purposes. The outstanding debt, January 1, 1907, was 68,949,000 francs. There is a Bank of West Africa, with a capital of 5,895,000 francs and reserve fund of 254,000. The use of French money is compulsory. The military force of 8956 includes 2098 Europeans. Each of their five colonies is under a lieutenant-governor, and Mauritania under a commissioner; these are subject to the control of the Governor-General (A. W. Merland-Ponty in 1909), who resides at Dakar, a fortified naval station in Senegal.

Hostilities were reported in August in the upper region of the Ivory Coast, where the French military expedition of June was opposed by the natives. Fighting was reported in December between the French and tribesmen near Belma, a frontier post west of Tibesti, and also in the region lying between the Algerian outposts and the French Niger territory in West Africa.

FRIENDS, THE; OR THE SOCIETY OF FRIENDS, often called QUAKERS. A denomination of Christians which resulted from the preaching of George Fox about 1647. There are in the United States four bodies of the denomination, the so-called Orthodox, the Religious Society of Friends, to whom the name Hicksite is sometimes given by those outside of the denomination, the Wilburite, and the Primitive. They differ chiefly in matters of church administration. In point of numbers the largest branch is the Orthodox, which numbered in 1909 99,623 communicants, with 1341 ministers and 568 monthly meetings. This branch of the denomination is strongest in the States of the Middle West. It has fourteen yearly meetings in the United States and one in Canada. Thirteen of these are combined in a federation known as the Five Years' Meeting. The next meeting of this body will be in 1912 at Indianapolis. The Orthodox branch has 12 colleges under its control, the best known of which are Haverford College for men, Earlham College for men, and Bryn Mawr for women. The most important event during the year was the reopening of Pickering College in New Market, Ontario, Canada. The former Pickering College was burned five years ago. A new secretary, employed by the American Friends' Board of Foreign Missions, spent the early months of 1909 visiting mission stations in Jamaica, Cuba and Mexico.

The Religious Society of Friends has in round numbers 20,000 members, with 183 annual meetings. It has seven yearly meetings in the United States and Canada. The Society has under its auspices Swarthmore College at Swarthmore, Pa., with thirteen preparatory and twelve secondary schools in New York, New Jersey, Pennsylvania, Delaware and Maryland. Its schools and colleges are all co-educational. In 1908 a new monthly meeting was established in Pasadena, California, the first of its kind belonging to this branch of Friends on the Pacific coast. In July, 1910, the Biennial General Conference will be held in Ocean Grove, New Jersey. The Religious Society of Friends carries on active philanthropic work, especially in the line of temperance. The Wilburite

branch had in 1909 about 4500 communicants, with 38 members. It has seven yearly meetings, each of which is independent, relations between them being maintained by an annual exchange of epistles. The Primitive body is very small. It numbers about 235 communicants and 11 churches. The Orthodox body maintains missions in 12 countries, and contributions are made for the maintenance of about 115 missionaries and 200 native workers. Among the institutions maintained by this body are the Friends' Asylum for the Insane, Frankford, Pa.; the German Dispensary and Hospital; the Pennsylvania Hospital for the Sick and Indigent; and the West Philadelphia Hospital for Women. Homes for the aged, widows and orphans are also maintained. The official organ of the Orthodox Friends is *The American Friend*, published in Philadelphia. The Religious Society of Friends publishes the *Friends' Intelligencer*, also located in Philadelphia.

FRITH, WILLIAM POWELL. An English artist, especially known as a figure and genre painter, died November 2, 1909. He was born near Ripon in Yorkshire, 1819, and studied in Sass's Art School in Bloomsbury. In 1840 he exhibited his "Malvolio before the Countess Olivia," which attracted considerable attention. His "Village Pastor," painted in 1845, made him an associate member of the Academy. For some time after he continued to paint in a similar vein, producing "The Parting Interview of Leicester and the Countess Amy," "The Coming of Age," "Pope Making Love to Lady Mary Wortley Montagu," etc. In 1853 he was elected a Royal Academician and shortly thereafter he began the "Portraiture of the Humorous Aspects of an English Crowd." Among the best known of his pictures is his "Life at the Seaside, Ramsgate," which was purchased by Queen Victoria. His "Derby Day," painted in 1858, was a vivid representation of this English carnival and was executed with admirable effect. He painted, as a commission from Queen Victoria, in 1865, "The Marriage of the Prince of Wales." Among his later works are: "The Railway Station," "The Road to Ruin" (1878), and "The Private View of the Royal Academy" (1881). He published in 1887 a volume entitled *My Autobiography and Reminiscences*, and in the following year published a second volume, entitled *Further Reminiscences*.

FRUIT GROWING INDUSTRY. See AGRICULTURE AND HORTICULTURE.

FUNGICIDES. See BOTANY.

GALLIFET, GASTON ALEXANDRE, AUGUSTE, Marquis de. A French military officer, died July 8, 1909. He was born in Paris in 1830. In 1853 he was commissioned sub-lieutenant, and he fought with such distinction in the Crimean War that he was attached to the staff of the Emperor. In 1862 he was transferred to the staff of the general in command of the Mexican expedition, and was severely wounded at the battle of Puebla. He saw service, in the same year, in Algiers, and again in 1868. He was made commander of a brigade in the Franco-German War, and was among those who surrendered at Sedan. Following the war he was effective in suppressing the Commune, and in 1872 he took charge of the El Golah expedition to crush revolting tribes in Africa. General de Gallifet was one of the strongest supporters of the Republic, and he became a personal friend

of Gambetta. He was given command of a division in 1875 and of an army corps in 1879. He greatly improved the methods of cavalry manœuvres, and he was called the greatest cavalry officer of his time. In 1894 he retired from active service, but he became conspicuous in the Dreyfus affair. He entered the Waldeck-Rousseau Cabinet as Minister of War, chiefly, he said, "in order to keep the Dreyfus affair in the proper path, neither for nor against the accused."

GALLOWAY, CHARLES BETTS. An American bishop of the Methodist Episcopal Church, South, died on May 12, 1909. He was born in Kosciusko, Miss., in 1849. He graduated from the University of Mississippi in 1868, and in the same year entered the Mississippi Conference of the Methodist Episcopal Church. He served in various churches in his native State. From 1882 to 1886 he was editor of the *New Orleans Christian Advocate*. In the latter year he was made bishop. He was a delegate to many conferences, and visited missions in Japan, China, Korea and Brazil. He was a trustee in many educational institutions.

GALVESTON, TEXAS. See ELECTORAL REFORM.

GAMBIA. A British Crown colony and protectorate on the west African coast. Area (colony and protectorate), 3615 square miles; estimated population, 137,516. The colony, consisting practically of St. Mary's Island, has an area of 4 square miles and a population of 8807. Capital, Bathurst, with 8807 inhabitants. There are government and mission schools. There is an armed police force of 80 men, and a company of the West African Frontier Force of 126. Imports (cotton goods, £82,023; rice, £71,889; kola nuts, £39,942; tobacco, £8248; spirits, £4872) amounted in 1907 to £445,359. Exports (ground nuts, £256,685; rubber, £5686), £408,467. In 1908 the imports and exports amounted to £390,740 (Great Britain £133,824) and £374,138 (Great Britain, £51,197) respectively. The revenue and expenditure for three successive years was as follows: 1906, £65,245 and £56,900; 1907, £65,892 and £57,729; 1908, £57,898 and £61,097. There is no public debt. The Governor (Sir George C. Denton) is assisted by an executive and a legislative council.

GAME LAWS OF 1909. The legislation affecting game enacted in 1908 was greater, and in some respects more important, than that of any previous year. All the States except seven held regular legislative sessions, and special sessions were held in Alabama and Ohio. At all the regular sessions game bills were under consideration and also at the extra sessions in Texas and Washington, but in Georgia, Kansas and South Carolina all legislation affecting game failed, leaving thirty-eight States which amended their game laws. In Canada game bills were passed in Alberta, British Columbia, Manitoba, New Brunswick, and Nova Scotia, and changes were made through Orders in Council in two or three other provinces. The total number of new laws passed in the United States and Canada was about 220, nearly half of which were local measures. The legislation of the year encountered unusual difficulties and obstacles. Besides the failure of the game laws in Georgia, Kansas and South Carolina, a general game bill and a section of another bill were

vetoed by the Governor of Washington, but at the extra session a general law was finally enacted on August 23. In Texas the bill passed at the regular session, but was vetoed and the measure passed at the second extra session failed of approval by the Governor, but was filed in the office of the Secretary of State and became a law without the Governor's signature. In California uncertainty was caused by the new deer law, due to the fact that through some mistake the bill signed by the Governor was different from the bill actually passed by the legislature, but it was nevertheless declared to be a law, as the only one which had received executive approval. A confusion somewhat similar regarding the elk statute in Wyoming was caused by the fact that a section of the new law closes the season until 1912, while another section provides an open season from September 25 to November 30, and still another section authorizes the holder of an ordinary or special license to kill one elk under each license. The State warden announced that licenses would be sold as usual during 1910. In Washington the entire game law was declared unconstitutional on account of certain defects of the title in some of the sections. An attempt, which failed, was made in South Dakota to invoke the referendum to defeat the game law passed by the legislature, after its passage.

GAME CODES. New game codes were adopted by Idaho, Missouri, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, Pennsylvania, South Dakota, Utah, West Virginia, Wyoming, and Manitoba, and commissions to codify the game laws were appointed in California, Maryland, and New Jersey. Protection to non-game birds was extended by the adoption of the so-called "model" law in Oklahoma and North Dakota, and by important amendment in California; while in Illinois, New Mexico, Pennsylvania, South Dakota, and West Virginia protection was removed from a number of predaceous birds without proper discrimination between injurious and beneficial species.

GAME REFUGES. Among the notable features of the year's legislation were certain provisions for game refuges in parks; protection accorded to Hungarian partridges in a dozen or more States rendered necessary by large importations of these birds during 1909; and the rapid increase in popularity of the alien licenses which was shown by the doubling in the number of States adopting this provision. Several novel provisions were adopted, among which were the authorization given to governors as a result of the severe forest fires of 1908 to suspend the hunting season in time of drought in Maine, Massachusetts and Vermont, and in New York to prohibit camping, hunting or fishing on lands in forest preserve counties. Provisions were also made in Massachusetts for making State game refuges of all State parks and the same action was taken in regard to State parks and national forests in Minnesota. A measure was passed in the Pennsylvania Legislature requiring persons intending to establish deer parks to drive off wild deer before enclosing their lands. In Colorado and Wyoming laws were passed providing for feeding big game during severe winter weather. The use of silencers on guns was prohibited in Maine, North Dakota, and Washington.

CHANGES IN SEASONS. The most notable changes in seasons were several giving added

protection to big game and some important species of game birds and a few reopening seasons for deer. Complete protection was given antelope in Montana, Nevada, Oregon, and Wyoming, thus prohibiting the killing of antelope everywhere in the United States except in Washington. Protection was given to elk and sheep in Oregon, does in Colorado, Missouri, and Oregon; cow moose in Nova Scotia; grouse and prairie chickens in Missouri and South Dakota; doves in Montana; doves and quail in Nebraska, and sage grouse in several counties in Utah. Spring shooting was prohibited in Massachusetts and North Dakota, and extended two weeks in Indiana, Nevada, and Oregon; three weeks in Nebraska, and the open season was extended from January 1 to March 1 in Idaho. Protection was given to various varieties of birds in Oklahoma, California, Illinois, New Mexico, and Oregon. Measures were adopted in Iowa, South Dakota, and West Virginia prohibiting the sale of all game throughout the year. Other States passed measures prohibiting and limiting the sale of game.

LICENSES. The growing popularity of the license system was shown by the prominent part it occupied in legislation in 1909. All the States except Arkansas and Georgia now license non-resident hunters, three-fourths of the States license residents, and about one-half license aliens. License legislation was enacted for the first time in Nevada, New Mexico, and Oklahoma. Resident licenses were established in New Hampshire, Vermont, Rhode Island, New Jersey, West Virginia, Iowa, Oklahoma, Texas, New Mexico, and Nevada, and alien licenses in a dozen or more States.

WARDENS. Several States made important changes in the warden service. South Dakota established the office of the State Game Commissioner, and North Dakota modified its system by providing a Game and Fish Board of Control to take charge of all matters relating to game.

GAME PRESERVES. An important feature of the new laws passed in 1909 was the provision made by several States for the establishment of game preserves and game refuges. Massachusetts provided for making game refuges of all State parks; New York made appropriation for the purchase of a State game farm; Minnesota enacted two bills making all State parks and national forests within its boundaries game refuges; Wyoming established a game preserve in the Big Horn Mountains; Idaho created a State game refuge on the Payette River; and California modified its law relating to State game refuges and created a new refuge of the Pinnacle National Forest in San Benito county. Twenty-six national bird reservations were created by executive order, making the present number 51. The President also set aside a small island in Alaska as a breeding ground for moose, and the high summits of the Olympic Mountains in Washington, which include the summer range of the Roosevelt elk, were set aside as an Olympic national monument.

GAMGEE, ARTHUR. An English physiologist, died March 29, 1909. He was born in Florence, Italy, in 1841, and was educated at Edinburgh University. From 1863 to 1869 he was assistant professor of medical jurisprudence at Edinburgh University. In 1873 he was appointed the first Brackenbury professor of physiology in Owens College, Manchester. From

1882 to 1885 he was Fullerian professor of physiology at the Royal Institute of Great Britain and assistant physician and lecturer on *materia medica* in St. George's Hospital, London. He was also examiner at several universities in Scotland and England. In 1902 he delivered the Croonian lecture of the Royal Society. From 1903 to 1905 he conducted for the Carnegie Institution at Washington an inquiry "On the present state of our knowledge of the Physiology of Nutrition." Among his published works are the translation of Hermann's *Human Physiology*; *Text-Book of the Physiological Chemistry of the Animal Body* (1880-93), and original papers on physiology and especially physiological chemistry.

GARBAGE AND REFUSE DISPOSAL.

The chief events in this field in 1908 were the letting of contracts for a mixed-refuse (garbage, rubbish, and ashes) incinerating plant for the city of Milwaukee, Wis., and for a garbage reduction plant for the city of Columbus, O. Neither plant had been completed at the end of the year. The Milwaukee incinerator will be of the high-temperature British type (Heenan & Froude), with provision for converting the heat generated into electric light or power. It will have a contract capacity of 300 tons of mixed refuse, and will be built under strict guarantees as to cost of operation and other results obtained. On the basis of the contractors' bids, the plant will produce a yearly revenue of \$7960, assuming that the steam produced is sold or utilized for power at the rate of 4 cents per 100 pounds of steam or 1½ cents per kilowatt-hour of electricity generated from the steam. The Columbus reduction plant, which will treat garbage only, and which, like all completed reduction works, will convert the garbage into marketable grease and a fertilizer base, will be the second example of a municipally owned and operated garbage reduction works. See "Statistics of Cities" for 1907 (*Special Bulletin, United States Census, 1909*) for some figures on the practice of American cities of 30,000 population and over.

GARRISON, WILLIAM LLOYD. An American merchant and publicist, died September 12, 1909. He was born in Boston in 1838, and was the son and namesake of the famous abolitionist. His education was obtained from private and public schools. At eighteen years of age he began his business career. He held various positions in banks in Lynn and Dorchester until 1864, when he went into the wool business, establishing in 1865 a commission house of which he was the head for twenty years. He retired from active business in 1900. Mr. Garrison took no part in public affairs until after the death of his father in 1879. Following that, he engaged in the various movements of the day for the improvement of social and political conditions. He was an advocate of Henry George's Single Tax theories, and also of the principles of the American Free Trade League.

GAS. According to the *Mineral Resources* of the United States Geological Survey, published in 1909, the total quantity of artificial gas produced in the United States in 1908 amounted to 156,909,310,000 cubic feet, valued at \$133,571,122. This total includes the gas manufactured at gas-house retorts, at water-gas works, and the surplus gas produced at by-product recovery coke plants. In 1907 the total production of all kinds of artificial gas amounted to

149,454,307,000 cubic feet, valued at \$126,635,416, compared with which the production in 1908 showed an increase of 7,455,003,000 cubic feet in quantity and of \$6,935,706 in value. The associated products in 1908 amounted to 6,253,125 tons of coke, valued at \$21,507,045; 110,430,663 gallons of tar, including 9,168,834 gallons of water-gas tar, valued at \$2,766,700; 30,615,835 pounds of anhydrous ammonia (the ammonia liquor reported being reduced to its equivalent in NH_3), valued at \$2,065,169; and 44,093,437 pounds of ammonium sulphate, valued at \$1,322,807.

The total quantity of coal carbonized at coal-gas works and in by-product ovens in 1908 was 9,252,978 short tons, of which 5,699,058 tons, or 62 per cent., were consumed in by-product oven plants, and 3,553,920 tons, or 38 per cent., were used at gas works. In 1907 the total quantity of coal carbonized was 11,490,661 short tons, of which 7,460,587 short tons, or 65 per cent., were consumed at by-product coke works, and 4,030,074 tons, or 35 per cent., at gas works. Notwithstanding the decrease in the quantity of coal carbonized in the gas-house retorts, the quantity of coal gas produced and sold increased from 34,302,954,000 cubic feet in 1907 to 37,355,886,000 cubic feet in 1908, while the output of surplus gas at by-product coke plants decreased from 20,516,731,000 cubic feet in 1907 to 16,205,925,000 cubic feet in 1908. The coke produced at gas works decreased from 2,510,106 short tons in 1907 to 2,051,899 tons in 1908, and by-product coke decreased from 5,583,038 short tons to 4,201,226 tons. The quantity of water gas produced and sold in 1908 amounted to 103,347,497,000 cubic feet, valued at \$90,343,221, against 94,634,620,000 cubic feet, valued at \$90,173,112, in 1907.

The quantity of coal gas sold for illuminating purposes in 1908 was estimated by the Geological Survey at 32,485,571,000 cubic feet, valued at \$23,590,930, an average of 73 cents per thousand cubic feet, while that sold for fuel was 21,076,242,000 cubic feet valued at \$13,627,971, or 65 cents per thousand cubic feet. In 1907 the quantity of gas sold for illuminating purposes was 30,156,774,000 cubic feet, valued at \$23,119,423, or 77 cents per thousand cubic feet, and the gas sold for fuel was 24,662,913 cubic feet, valued at \$13,342,881, or 54 cents per thousand.

Oil and water gas production had developed with marked rapidity, and a number of companies formerly producing coal gas changed over to oil or water gas, in whole or in part. In 1907 there were 516 coal-gas companies which reported to the Geological Survey, and in 1908 there were 506, a decrease of 10, and in 1907 there were 13 less than in 1905. The number of oil and water gas companies reporting increased, however, from 477 in 1905 to 520 in 1907 and to 552 in 1908. In the quantity of oil and water gas produced there was an increase from 82,959,229,000 cubic feet in 1905 to 102,139,875,000 in 1907, and to 110,237,203,000 in 1908. Of the total production of oil and water gas in 1908 approximately 7,000,000,000 cubic feet were lost or unaccounted for, leaving 103,347,497,000 cubic feet as the net production sold. This was nearly double the quantity of coal gas sold in 1908. It was also to be noted that the values of oil and water gas are higher than those of coal gas, the average price for all of the oil and water gas sold in 1908 being 93 cents,

against 70 cents for coal gas. A part of this was due to the larger proportion of oil and water gas sold for illuminating purposes and part to the inclusion in the coal gas of the product from by-product coke ovens, most of which is sold for fuel purposes while the proportion sold for illuminating purposes is usually turned over to other distributing companies at a much lower price than that at which it reaches the consumer. About 75 per cent. of the total quantity of oil and water gas produced in 1908 was sold for illuminating purposes and 25 per cent. for fuel purposes.

On January 4, 1909, the United States Supreme Court handed down a decision on the appeal of the State and city of New York from the decision of the Circuit Court of the United States for the Southern District of New York, and decided that the "80 cent gas bill" passed by the legislature of the State of New York in 1906 was legal and that the rate was not confiscatory so as to render the law unconstitutional, as was decided by the lower court, which restrained the city from enforcing the provisions of the acts and the order relating to rates and penalties. The original laws concerned in this litigation were passed in 1905 and 1906, the latter year bringing forth the law (Chap. 125, Laws of 1906) limiting the prices of gas in the Borough of Manhattan and the Bronx to other consumers than the city of New York to 80 cents per thousand. The Supreme Court, after examining the facts in the case, decided that the 80 cent law was not confiscatory in that returns of 6 per cent. upon the total value of the property would be produced. Subsequent events, said the Court, might show that the rate of 80 cents was unreasonable and in such event relief might be demanded by the company without prejudice. Immediately after the announcement of the decisions steps were taken to repay to consumers the excess payments which had been held under the direction of the Court until a final decision was reached in the matter. This was done, and during the year the many thousands of customers of the gas company received checks in settlement of their claims. This marked the conclusion of one of the most significant attempts to regulate a large public utility, and the outcome of which was awaited with interest in other States than New York.

In London during the year 1909 high-pressure gas found increased application for illumination and high-power lamps were installed both for public street lighting and in adjoining works and factories. Inverted gas lamps of approximately 1500 candle-power for high-pressure mains were used in Fleet Street, and were found decidedly economical, consuming but 25 cubic feet of gas per hour apiece. Similar lamps displaced electric arc lamps in Berlin and other European cities for street lighting, and so successful have they proved that considerable encouragement in the future of this department of the industry was manifested by gas engineers. Reinforced concrete construction was making itself felt in the gas industry, as elsewhere, and a number of large tanks were built of this material. The Turin Gas Works built such a tank 136 feet in diameter and 33½ feet in depth, and other gas-holding tanks standing clear of the ground have been built of this material. A steel tank 216 feet in diameter and nearly 40 feet deep was contracted for to be erected

at Toronto, and when completed will rank as the largest tank of this class. A serious accident occurred on December 7, when a large tank of steel and concrete of about 7,000,000 cubic feet capacity, at the Grassbrook Works of the Hamburg Corporation failed shortly after the gas-holder had been put into use. The roof of the vault within the annular tank collapsed, permitting the escape of the gas from the holder, and this becoming ignited produced a serious fire, which destroyed adjoining property and another gas-holder. The accident caused a loss of 20 lives and injury to many other people. Another serious accident took place at Geneva on August 23, when an explosion occurred, resulting in the destruction of a large quantity of buildings and machinery.

Blau Gas, a compressed gas mixture, where gases rich in carbon, which liquefy under pressure, have not been eliminated, as in the usual forms of compressed gas, figured prominently in the year 1908. In Germany the mixture, which was put on the market in steel cylinders, contained the liquefied heavier gases and was especially useful for incandescent gas lamps. It found considerable application in Germany for lighthouse illumination and figured in some of the more important installations. The cylinders of liquid gas could be distributed with as much facility as supplies of oil, and when used with incandescent mantles furnish a very satisfactory illuminant for lighthouse lanterns.

GAS, NATURAL See **NATURAL GAS**.

GAS ENGINES. A number of the large gas engines were being installed during 1908 at the Gary Works of the Indiana Steel Co., and the large power plant with an ultimate capacity of over 200,000 horse-power was gradually being brought into use. These engines maintained their position for size among the largest ever constructed and fully met anticipations. In marine gas engines progress was made, but nothing very much in advance of the work of previous years. The non-magnetic yacht *Carnegie* was put into commission with auxiliary gas engines and a producer for gasefying coal, and the machinery which was constructed with a minimum of steel met all expectations. Several yachts with producers and gas engines were built during the year but none of extraordinary size.

During the year 1909 these appeared as Bulletin 416 of the United States Geological Survey, *Recent Development of the Producer-Gas Plant in the United States*, by Robert Heywood Fernald, in which the progress of the gas engine and the gas producer in the United States is traced and the details of tests and of the operation of various plants are given. The conditions for 1909 as a result of a personal inspection are contrasted with those of 1906, when a similar investigation was made by Mr. Fernald. He concludes that many circumstances "point directly toward the development of highly efficient gas power units which can operate on many types of fuel and can be installed at a total cost that compares favorably with that of the corresponding steam plant and at the same time insures the manufacturer a fair profit." It is further shown that there had been a definite increase in the manufacture of and demand for gas-producer plants, a demonstration of their reliability approximating if not equaling that of a steam plant, that they

are more satisfactorily designed, sold and operated, and in the main show satisfactory economy. Manufacturers and owners report that considering the very brief period of development that has passed since the introduction of this type of power the plants as a whole are giving remarkable satisfaction. There still was a lack of competent operators, though not as marked as formerly, but selling conditions were vastly improved and more intelligent and better informed salesmen and sales engineers were working for the manufacturing companies. Finally the plants themselves were being carefully studied by all concerned.

One of the chief economies in the generation of power with the gas engine and the producer is the availability of less expensive grades of fuel. In America experiments have centred chiefly around lean coals, but in Europe other substances were being taken into consideration. Thus there was a demand for a suction producer that would generate gas direct from wood. There is no record of such an achievement, but a producer was designed to operate with coconut shells after they have been charred in a suitable retort, while saw-dust from wood-working mills, which is not only waste product but difficult to dispose of, can be utilized in a type of producer made by an English works. It was also possible to transform tannery refuse into gas in a special apparatus. These same manufacturers built a plant where peat was the fuel employed, and like other gas engine makers were working with a producer for bituminous coal, a device that previously had not been developed in a satisfactory form. A recent device was a suction producer so modified that gas for both power and heat was obtained. With producers thus taking care of various wastes of manufacturing, the hope was expressed that street and domestic refuse eventually could be utilized more economically than by burning under boilers as is now done occasionally, and that power as for electric lighting could be generated at a municipal station. British manufacturers reported a striking increase in the number of gas engines ordered for textile mills, where despite a prejudice against this form of power, improved gas engines are securing a footing. They were found advantageous as they would start against the load without friction clutch and run steadily as is required in a cotton mill. See also **PUMPING MACHINERY** for description of new Humphrey Gas Pump.

GATUN DAM. See **DAMS**, and **PANAMA CANAL**.

GAYNOR, WILLIAM JAY. An American jurist and public official, on November 2, 1909, elected Mayor of New York City. He was born in Whitestown, N. Y., in 1851, and was educated at Whitestown Seminary and in Boston. In 1873 he removed to Brooklyn and was for several years engaged in newspaper work on New York and Brooklyn newspapers while studying law. He was admitted to the bar in 1875 and immediately began practice. He appeared in many important cases, among them the famous case of John Y. McKane, the political boss of Long Island City, who was convicted of election frauds. He took an active interest in politics and was generally known as a Radical Democrat. In 1903 he was nominated by Republicans and Independent Democrats for judge of the Supreme Court and

was elected. He declined the Democratic nomination for Governor and also for judge of the Court of Appeals in 1894 and 1897 and for mayor of Brooklyn in 1896. In 1904 he declined the Democratic nomination for governor. He became justice of the Appellate Division of the Supreme Court of New York in 1899. Judge Gaynor, although for many years a bitter enemy of the methods of Tammany Hall, accepted the endorsement of that body for mayor in 1909. After a bitter conflict in which he was opposed by Otto T. Bannard, Republican, and William R. Hearst, Independent, he was elected by a majority of 70,000, although the remainder of his ticket was defeated. See NEW YORK.

GEOGRAPHICAL SOCIETY, AMERICAN. A learned society organized in 1852 to investigate and disseminate new geographical knowledge by discussion, lectures and publication; to encourage geographical exploration and discovery and to establish in the chief maritime city of the country, for the benefit of commerce and navigation and the great industrial and material interests of the United States, a place where the means shall be afforded of obtaining accurate information for public use concerning every part of the globe. The membership of the society in 1909 was 1250. It has a constantly increasing geographical library of over 40,000 volumes and a large and very valuable collection of maps, charts and atlases relating to every part of the world. It publishes a bulletin and cooperates and interchanges information with over 300 domestic and foreign geographical and other scientific societies. The Society has a house at 15 West Eighty-first Street, New York City. The officers in 1909 were: President, Archer M. Huntington; Vice-Presidents, D. O. Mills, John Greenough, and Anton A. Raven; Foreign Corresponding Secretary, Professor William Libbey; Domestic Corresponding Secretary, Archibald D. Russell; Recording Secretary, Hamilton F. Kean; Editor, Cyrus C. Adams, and Librarian, Frederick S. Dellenbaugh.

GEOGRAPHIC SOCIETY, NATIONAL. A learned body, founded in 1888, for the publication of the results of geographic exploration and research. The data thus gathered is published in an illustrated monthly magazine, and the Society publishes in addition large maps and various books. The library it maintains at its headquarters in Washington, where gold medals are awarded and a series of addresses is given. In June, 1909, the Society sent an expedition to make a study of glaciers in Yukatat Bay and Eastern Prince William Sound, Alaska, under the leadership of Professor Ralph S. Tarr, of Cornell University, and Professor Lawrence Martin, of the University of Wisconsin, who, with a party of five, took the field, returning in September with matter rich in scientific value. The outfitting of this expedition, entirely contributed by the Society, amounted to \$6000. During 1909 there were four awards of gold medals for notable geographic achievement by

the Society. The Hubbard medal awarded to Commander Robert E. Peary was presented to him at the annual dinner of the Society on December 15, on which occasion a gold medal was also presented to Captain Robert Bartlett, his navigating officer, for distinguished achievement in Arctic exploration. A gold medal was awarded Edward H. Shackleton for exploration in the Antarctic, which will be presented when he appears before the Society, March 23, 1910. A gold medal was also presented to Professor Grove Karl Gilbert for distinguished geographic research. The Society sent to Sicily a trained geologist to investigate the Messina earthquake, and the report, as well as that of its Alaskan expedition, was given to the world in the *National Geographic Magazine*. The membership of the organization is 55,000. The officers in 1909 were: President, Willis L. Moore; Vice-President, Henry Gannett; Secretary, O. P. Austin; Treasurer, John Joy Edson; Editor of the magazine, Gilbert H. Grosvenor. The officers elected for 1910 are: President, Henry Gannett; Vice-President, O. H. Tittman; Secretary, O. P. Austin; Editor and Director, Gilbert H. Grosvenor.

GEOLOGICAL SOCIETY OF AMERICA. See GEOLOGY.

GEOLOGY. The progress of geological investigation during 1909 conformed essentially to the course noted for the few preceding years. It was characterized by cumulative gains rather than by extensive advances in particular departments. A review of the year's contributions as a whole showed, perhaps, a more manifest effort than for some time toward the coordination of materials already in hand and their systematic study. The Darwin centenary gave a strong impetus in that direction, for it was the occasion of a general discussion of evolutionary theories in relation to the biological sciences. Within the field of inorganic geology there was a similar striving for a more definite statement of principles on the basis of recent discoveries in physics and chemistry.

GLACIAL GEOLOGY. In a paper on the physical geography of the Pleistocene period, R. D. Salisbury referred to the important changes of altitude which took place at the close of tertiary time and which were probably related to the profound climatic change that brought on the continental glaciation. The land of eastern North America seems to have stood a few hundred feet higher than the present level, though some geologists are inclined to place the elevation at a thousand feet or more above the existing surface. The same relative conditions obtained in the Mississippi valley. The West experienced a greater uplift, ranging from 1500 to 6000 feet. It is thought that the elevation did not lead directly to the revolution of climate, but more rapid erosion ensued, and so a greater consumption of carbon dioxide. With the abstraction of this gas from the atmosphere, the temperature was correspondingly reduced, while the cooler oceanic waters were able to hold a larger proportion of it in solution, thus reducing the temperature still further. The glaciation had a profound effect upon life. The inhabitable land of the globe was reduced by one-seventh and conditions of existence were made very inhospitable over a still larger area. Migration was forced upon many forms, and those which could not migrate were reduced in numbers or exterminated.

Penck and Brückner, who have devoted many

years to the study of the glaciation of the Alps, gave some interesting data as to the duration of the glacial period and the time that has elapsed since the disappearance of the ice-sheet. They distinguish four stages of glacial activity, called the Gunz, Mindel, Riss, and Würm, the names being taken from places in the Alpine foreland. A comparison of the relative weathering and erosion of the different deposits indicates that the Riss stage is about three times, the Mindel at least twelve times and the Gunz about eighteen times the age of the Würm, which is the most recent. The culmination of the last stage is placed at a round 20,000 years ago, on the basis of various evidences. The opening of the Glacial period may thus have been about 350,000 years ago. Evidences of human culture can be traced back to the interval between the Riss and Würm stages, a period of human development known to anthropologists as the Moustérien. The Swiss lake dwellings date back 4000 years, if not more.

The report of an international committee of geologists showed that the greater number of present glaciers are retreating. In Scandinavia alone are to be found marks of a general advance, the number of growing glaciers being fifteen, as compared with three that are in retreat. Of fifty glaciers in the Swiss Alps that have been under observation, only one (Glacier de Vorab, in the Rhine basin,) has shown a growth.

PRE-CAMBRIAN FORMATIONS. F. D. Adams divides the Pre-Cambrian into three periods—Eo-Proterozoic, with the Laurentian and Kee-watin subdivisions; Meso-Proterozoic, including the Lower and Middle Huronian; and Neo-Proterozoic, which embraces the Upper Huronian and the Keweenawan subdivisions. This classification is based on the results of study in the great area of Pre-Cambrian rocks in Canada called Laurentia. It is a striking agreement, however, with the recent work of Willis in China. The three main periods are separated by two great epochs of diastrophism that are marked by profound unconformities. The subdivisions are practically equivalent to those adopted in the dual classification of Van Hise, but Adams emphasizes the importance of the unconformity between the Middle and Upper Huronian, which he believes to be of the same rank as the break between the Laurentian-Kee-watin period and the Lower Huronian. In the Upper Huronian he places the Nastopoka series of sandstones, limestones, jaspilites and iron ores that is so strongly developed in Labrador and the Hudson Bay region. The series of coarse sandstones which occupies an area of 24,000 square miles in the vicinity of Lake Athabasca is correlated with the Keweenawan series of Lake Superior.

The principles to be used for the classification of Pre-Cambrian rocks and their correlation were summarized by Van Hise under the following heads: Lithological character, continuity of formations, likeness of formations, like sequence of formations, subaërial or subaqueous deposits, unconformities, relations to series of known age, relations with intrusive rocks, amount of deformation, degree of deformation, degree of metamorphism. In his view the division of the Pre-Cambrian into Archean and Algonkian is the only one of general or world-wide application. The Archean is a

group dominantly of igneous rocks, largely volcanic and for extensive areas submarine. The Algonkian is mainly a group of sediments with subordinate volcanic rocks. While the deposition of Algonkian sediments probably was effected by agencies very similar to those of the present day, in Archean time the physical conditions had not yet become favorable to an orderly succession of sediments. The great contrast between the two groups is shown wherever the Pre-Cambrian has been studied.

DYNAMICAL GEOLOGY. The character and cause of the widespread deformation of the earth that is revealed in its past history were discussed by T. C. Chamberlain, who inclines to the view that movements of upheaval and subsidence have been periodic rather than continuous and that they are due to deep-seated causes. Some influence may be conceded to the effects of erosion in one area and deposition in another on the principle of isostatic adjustment, but these processes are incompetent to explain the cycles of deformation through which the world has passed. The study of deformation is of fundamental importance, as it affords invaluable assistance in the correlation of rock formations.

The modifications of climate during previous ages were ascribed by W. R. Eckhardt to the following causes: Displacement of the earth's axis; changes in the distribution of land and water, and vertical movements of the earth's surface. The character of the climate can often be inferred from the colors of the soils; for example, bright red and yellow soils are characteristic of the tropics, and gray, brown, and yellow of the temperate zones. Tracing back the conditions into past eras we find that land plants were absent in Algonkian time and that the character of the sediments points to a desert climate. During the Cambrian period the climate was strongly differentiated; reddish colored rocks of this age prevail in the lower latitudes, and yellow gray and green strata in the higher latitudes. Indications of glacial phenomena are found at the North Cape, in Australia, and China. During the Silurian, Devonian and Carboniferous periods an oceanic climate prevailed over the greater part of the land surface which was distributed in the northern hemisphere. From the occurrence of coal seams it may be assumed that the climate in the Carboniferous was somewhat varied for the measures are found mostly between the parallels of 35° and 60° north latitude and 25° and 45° south latitude, or in those belts where the formation of peat bogs is taking place at the present time. Coal is not, however, a product of peat, but has been derived from plant tissue through a process of fermentation. In the Permian period glaciation was widespread, due possibly to the shifting of the poles combined with crustal movements. The Mesozoic continental lands had a desert climate, while the early Cenozoic climate was perhaps warmer than at present, at least in Europe.

In a study of the more recent changes of climate, subsequent to the Glacial period, Ellsworth Huntington stated that the climate of most of Asia and apparently of all continental regions between the parallels of 20° and 50° has gradually become warmer and drier. The change from the cold moist conditions of Glacial time can be said to be still in progress.

PETROLOGY. Wright and Larsen have made some interesting observations on the behavior of quartz at high temperatures, based on the fact that an inversion of optical characters takes place at 575° and at 800° C., the mineral is unstable, passing into tridymite at a temperature above the latter limit. It was found that these critical points can be used to indicate the approximate limits of temperature within which quartz has been formed in nature. The quartz of veins, geodes and certain vein pegmatites has the characters that belong to temperatures below the inversion point. On the other hand, the quartz of granite, granitic pegmatites, and porphyries seems to have crystallized at above 575°, but probably below the critical point of 800°.

E. H. L. Schwartz brought up the question of meteoric falls in past ages and pointed out the possibility that some rock masses which have hitherto been considered volcanic outpourings may be really of meteoric origin. The great lava sheets of the Snake River in Idaho, the Deccan traps of India and the Kapte Plains of British East Africa are suggested for study in that connection. The district of Prieska, south of the Orange River, in Cape Colony, contain amygdaloidal melaphyres that in their geological relations seem to be intrusive, but they have the structures of volcanic rocks. There are, however, no known vents through which they could have been erupted; they have not the appearance of surface flows and involve a large amount of crushed materials. Their derivation from a meteoric swarm under the circumstances seems the most probable explanation. The crater of Coon Butte, Arizona, is mentioned, and probably correctly so, as the result of a meteoric collision, though in this case the meteor seems to have been metallic and to have been vaporized by the heat of the impact.

The relation of stony meteorites to terrestrial rocks was considered at some length by G. P. Merrill. Meteorites which fall upon the earth may be divided into three classes: First, those which consist of an alloy of iron and nickel, nearly or quite devoid of silicate minerals; second, those made up of spongy iron with globular aggregates of silicates; and third, those consisting nearly or entirely of silicate materials. Comparing them with the components of the earth, we might consider the purely metallic varieties as representative of the interior part, the silicates as representing the outer crust, and the spongy masses as perhaps a transition phase between the crust and the interior. By combining chemical analyses of the stony meteorites Merrill arrives at an average composition, which he compares with the averages for terrestrial rocks as calculated by Clarke and Washington. The comparison brings out a striking difference, due not alone to the relative proportion of the constituent elements, but to their manner of combination. This variation is shown in the low silica content of the meteorites and their high percentages of metallic iron, ferrous oxide, and magnesia; whereas the percentages of alumina, lime, and alkalies are correspondingly higher in the terrestrial rocks. The closest approximation to the meteorites is found in the class of rocks known as peridotites, which are the most basic of all; while the stony meteorites represent the most acid types

that have come to us from space. It is therefore apparent that the meteorites cannot represent the actual materials of which the earth is composed, for by no process of differentiation would they yield a series so widely variant in composition as are the igneous rocks of the earth.

In his *Natural History of Igneous Rocks*, which was published during the year, Harker gives a very clear presentation of the subjects of igneous activity, magmatic differentiation, and rock classification with suggestive criticism of current views. The work will be appreciated also for its review of recent developments from the side of physical chemistry. An important contribution to the theory of petrology is Iddings's *Igneous Rocks*, of which the first volume, now issued, deals with composition, texture, and classification.

ECONOMIC GEOLOGY. The views regarding the origin of petroleum that have been, or are still held by students were summarized by L. V. Dalton, who presented strong arguments in favor of the derivation from organic matter. Aside from geological considerations, which have been its main support in the past, the organic theory is validated by recent chemical work which has thrown new light on the composition of natural mineral oils. It has been found that cholestol, a compound inherent in all mineral oils and fats, and phytosterol, a similar compound peculiar to plants, are common to petroleum, in fact are the principles which determine its optical activity. On the other hand, oils made by chemical synthesis are optically inactive, however much they may resemble the natural products. It is believed that marine life has afforded most of the material for the formation of petroleum, though the relative importance to be attributed to animal and vegetable organisms is not yet determined. That terrestrial plants have not had any prominent part in the process is probable, owing to the high temperature required for the destruction of their tissues.

In a discussion of the methods by which oil and gas are accumulated in rocks, M. J. Munn called attention to the defects that arise in previous explanations when these are put to practical test. The anticlinal theory of Orton found wide acceptance at first, as it seemed to meet the conditions in many of the Appalachian fields, but later work uncovered inconsistencies that have limited its usefulness. It fails most signally in that it does not account for the great pressure under which oil and gas frequently exist in the rocks. Pressures up to 1500 pounds to the square inch are encountered in gas wells, whereas the extreme pressure explainable by the difference of gravity between water and gas or through hydrostatic pressure under ordinary conditions is from 10 to 55 pounds. The active agent in the accumulation of oil and gas, according to Munn, is water moving under hydrostatic and capillary pressure, which assembles the small quantities distributed through the strata and pushes them ahead of its course until they are trapped by conflicting currents. The pools of commercial value would accumulate in the more porous strata. Once assembled the pressure is maintained by the expansive force of the gas, which may have been collected with the oil or have been generated subsequently from it. The diffusion of the gas is prevented

by the saturated condition of the surrounding rocks. In applying this explanation to practical uses it is necessary to take cognizance, not only of the structural features as influencing the flow of underground waters, but also of the general characters of the beds and all facts bearing upon their relative porosity.

The deposits that constitute the Rand gold-field of the Transvaal have naturally received a great deal of attention, inasmuch as they represent by far the largest field of gold mining operations in the world. The opinions of geologists have been divided in regard to the origin of the gold, which is distributed through a conglomerate called pebble reef or basket. The sedimentary derivation of the conglomerate is unquestioned, but the point of main interest is whether the deposits should be considered ancient placers or whether the gold has been introduced subsequent to the deposition of the beds. According to J. W. Gregory, the conglomerate is probably of Pre-Cambrian age. Its gold content is to be traced to auriferous quartz veins that occur in an older series of schists, at least the weight of evidence points to such a source. There are no apparent channels through which mineralizing solutions may have circulated and no marks of chemical changes in the rich basket, as one would expect in deposits due to underground waters. Furthermore, the limitation of the gold to certain beds, and its absence from other beds equally favorable for the circulation of such waters are features inconsistent with the view of its secondary introduction. The placer theory is therefore to be accepted. The question is not without economic importance, since it has a more or less direct bearing upon the continuation of the deposits in depth.

GEORGE JR. REPUBLIC. An experiment in practical philanthropy, begun in 1895 by William R. George at Freeville, N. Y. Its objects are "to prevent crime, develop character, and to promote good citizenship." The government of the republic is modeled upon the government of the United States, and is presided over by the President, who is assisted by the President's Cabinet. Practical affairs of the republic are administered by the citizens under the supervision of officers. Each student works five hours and attends school five hours each day. The curriculum includes a college preparatory course. The support of the republic is practically from voluntary contributions, and its affairs are carried on by the George Jr. Republic Association, which has about 1400 members. There were in 1909 about 160 boys and girls in the republic, with a waiting list nearly equal to that number. In the property occupied by the republic there are 350 acres, with thirty buildings, including cottages, shops, and barns. The year 1909 was the most successful one in the history of the republic. The efficiency of the industries was greatly increased and the standard of the school raised. The experiment has been widely observed and similar associations have been formed in other parts of this country. The president of the Association is Thomas M. Osborne; secretary, Joseph Burden; and the treasurer, A. G. Agnew.

GEORGETOWN UNIVERSITY. An institution of higher learning, under the auspices of the Roman Catholic Church, at Wash-

ington, D. C., founded in 1789. There were in attendance in 1908, 859 students, with 144 members of the faculty. There was received during the year in benefactions \$35,000. Rev. J. B. Creeden was appointed Dean of the Faculty of Arts and Sciences, and the Hon. Wade Ellis was appointed lecturer on international law. A new seismographical observatory was established during the year. There are 102,500 volumes in the library. The president is Rev. Joseph J. Hemmel, S. J.

GEORGIA. One of the South Atlantic Division of the United States and one of the thirteen original States. Its total area is 59,265 square miles, of which 540 are water. The population in 1900 was 2,216,331, of whom 46.7 per cent, were colored. According to a Federal estimate made in 1909 the population in that year was 2,557,412. The capital is Atlanta.

MINERAL PRODUCTION. This State is an important producer of minerals, including coal and iron. There were produced in 1908 321,060 long tons of iron ore, as compared with the product of 1907 of 444,114 long tons. The total production of coal in 1908 was 284,822 short tons, having a spot value of \$364,279. This is a marked decrease over the production of 1907, which was 362,401 short tons, valued at \$499,686. The output in 1908 was less than in any year since 1899, which can be attributed almost entirely to the depression in the iron trade, which particularly affected the production of high grade coal and the manufacture of coke. There were employed in the coal mines of the State in 1908 670 men, as compared with 808 in 1907. Coke was manufactured in 1908 to the value of \$137,524, from 394,222 tons produced. There were two coking establishments, with 350 ovens. The State is one of the largest producers of asbestos and bauxite. There were produced in 1908 2719.01 fine ounces of gold, valued at \$56,207, as well as a small amount of silver. Other products are Portland cement, pyrite, precious stones, copper, lead, and mineral water. The value of the mineral products of the State for 1908 was \$5,200,881, as compared with a value of the product of 1907 of \$6,841,003.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops of the State in 1908 were as follows, according to the figures of the United States Department of Agriculture: Corn, 61,160,000 bushels, valued at \$52,598,000, from 4,400,000 acres; winter wheat, 2,450,000 bushels, valued at \$3,552,000, from 245,000 acres; oats, 6,650,000 bushels, valued at \$4,722,000, from 350,000 acres; rice, 100,000 bushels, valued at \$87,000, from 4200 acres; potatoes, 810,000 bushels, valued at \$810,000, from 10,000 acres; hay, 117,000 tons, valued at \$1,849,000, from 87,000 acres; tobacco, 1,470,000 pounds, valued at \$499,800, from 2100 acres. The corn crop of 1909 showed a considerable increase over that of 1908, when the production was 53,750,000 bushels. The acreage also increased by 100,000; winter wheat showed an increase over the crop of 1908, which was 2,208,000 bushels, while the acreage increased 5000. The oat crop was over 1,000,000 bushels greater in 1909 than in 1908, while the acreage increased about 50,000. The rice crop increased from 87,500 bushels to 100,000 in 1909 and the acreage increased from 3500 to 4200.

The tobacco produced showed a considerable falling off from the crop of 1908, which was 2,705,625 pounds, while the acreage fell from 2375 to 2100. Cotton is the most profitable agricultural product in the State. In 1909-10 the production was 1,800,000 bales. Other valuable crops of the State are peanuts, sweet potatoes, and fruit. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 141,000; dairy cows, 314,000; other cattle, 673,000; mules, 248,000; sheep, 245,000; swine, 1,647,000. All varieties of farm animals have increased considerable since 1900. The wool clipped in 1909 was 571,040 pounds.

FISHERIES. The products of the fisheries of the State for the year ending December 31, 1908, amounted to \$699,660. Of these the most important in amount in value was oysters, of which 1,423,000 bushels, valued at \$332,990, were taken for market purposes and for seeding purposes 23,000 bushels, valued at \$4600. Next in importance was shad, of which 1,333,300 pounds, valued at \$190,000, were taken. Red snapper were caught to the amount of 880,000 pounds, valued at \$30,000. Terrapin and turtles amounted to 42,500 pounds, valued at \$21,030. Among other important fishes were catfish, 279,500 pounds, valued at \$14,730; sea bass, 233,000 pounds, valued at \$13,730; squeteague or trout, 139,500 pounds, valued at \$11,610; sturgeons, 100,000 pounds, valued at \$7000; prawn, 394,000 pounds, valued at \$12,700. The number of independent fishermen in the State during the year was 634, and 1891 wage-earning fishermen were employed. There were 88 vessels engaged in the fisheries of the State, valued at \$83,672.

EDUCATION. The school attendance in 1908, the latest date for which statistics are available, was 322,050. There were 2860 male teachers and 8036 female. The average salary of teachers was, for white, \$44.29, and for colored teachers, \$20.23. The expenditures for education during the year were \$3,742,946. The compulsory education law, which went into effect in 1908, has been followed by excellent results. The State appropriation for 1909 was \$2,250,000.

FINANCE. According to the report of the State treasurer, the balance at the end of the fiscal year 1908 was \$638,717. The income for the fiscal year 1909 was estimated at \$5,113,381, while the expenditures were \$5,104,806, leaving an estimated balance at the end of the fiscal year 1909 of \$847,292. The chief sources of revenue are *ad valorem* on property, polls, railroads, and other specific taxes, railroad rentals, "near-beer" license fees, interest from State depositories, etc. The chief disbursements are for public schools, pensions, charitable institutions, civil establishment, legislature, etc. The bonded debt at the end of the year 1909 was \$7,036,202.

CHARITIES AND CORRECTIONS. The most important event in the history of the correctional institutions of the State in 1909 was the operation of the law which puts an end to the leasing of convicts to private individuals and corporations (see *Politics and Government* below). The legislature of 1907 established a municipal farm for persons convicted of minor misdemeanors. The State has no Department of State Charities, but charity organization societies exist in nearly all the large cities and towns.

POLITICS AND GOVERNMENT. On April 1 the convict lease system, for so many years in operation in the State, came to an end as the result of action of the legislature in 1908, which responded to the demand of the platform on which Joseph M. Brown was nominated for governor, and 2500 prisoners were transferred from various private stockades to the respective counties in which their crimes were committed. The State had been leasing convicts for forty years. The system was abolished because the lease term had expired and popular sentiment demanded it. Instead of being leased to mines, brick kilns and factories, convicts, in accordance with this law, will work on the public roads of the State, under the supervision of the counties, and a great system of highways will be developed. On April 17, Judge Sheppard of the United State Court handed down a decision on the demurrer in the case of the United States against the American Naval Stores Co., of the so-called "Naval Stores Trust." The court overruled the demurrer on the first and second counts of the indictment, but sustained it as to the third count. This charged monopolizing and attempting to monopolize, and the court overruled both for the reason that two separate offenses should not have been charged in the second count and because of its uncertainty. The effect of the court's decision is to uphold the penal provisions of the Sherman Anti-Trust Law and to order the defendants to trial on the charge of conspiracy in restraint of trade. On June 26 Joseph M. Brown was inaugurated Governor of the State to succeed Hoke Smith. After taking the oath of office, Governor Brown made a brief address, expressing the hope that peace might prevail during his administration. On July 6 the State Legislature by a unanimous vote reelected Alexander Stevens Clay to the United States Senate.

The report of the Chief of Police of Savannah, made public on June 6, showed in the first year of the operation of the Prohibition law a decrease of 147 in the number of arrests for drunkenness, compared with 1907, when the saloons were opened. A remarkable feature of the report was the statement that there were no gambling houses in the city, all having been closed during 1908. There was considerable opposition to the enforcement of the law in Savannah, and it was charged by the Prohibitionists that the city treated the law with contempt. The legislature of 1908 imposed a State tax of \$200 on the so-called "near-beer" saloons, but when the State attempted to collect this tax in Savannah, the effort met with much opposition. The State Senate on August 5, in the closing weeks of the session, by a vote of 37 to 2, refused to consider the income tax amendment to the Federal Constitution, postponing action to the summer session in 1910, on the ground that there was plenty of time, and that even by then but few States would have acted.

OTHER EVENTS. On August 21 a race riot at Marietta was averted only by the prompt action of Governor Brown in ordering out State troops. The trouble was caused by a negro stabbing a young white man. The negro was lodged in jail, but the building was attacked by the mob, who threatened to lynch the negro and uttered threats also against all the negroes in town. Governor Brown was in-

formed of the situation and hurried to Marietta. On the arrival of the militia the mob dispersed. In May a serious strike occurred on the Georgia Central Railroad and for a considerable time the entire road was tied up. The strike was caused by alleged discrimination on the part of the railroad in favor of negro firemen. For an account of this strike, see the article **STRIKES**.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below. The most important measure enacted was the new election law prescribing the qualifications for electors, the registration of voters, and containing other provisions. The qualifications of the electors as defined in this measure are as follows: (1) All persons who have honorably served in the land or naval forces of the United States in the Revolutionary War or in the War of 1812, or any other war carried on between the States or with foreign countries. (2) All persons lawfully descended from those mentioned above. (3) All persons who are of good character and understand the duties and obligations of citizenship under a republican form of government. (4) All persons who can correctly read in the English language any paragraph of the Constitution of the United States or of the State of Georgia and correctly write the same in the English language when read to them by any one of the registrars, and all persons who solely on account of physical disabilities are unable to comply with the above requirements, but who can understand and give a reasonable interpretation of any paragraph of the Constitution of the United States or Georgia that may be read to them by any of the registrars. (5) Any person who is the owner of at least forty acres of land situated in this State, upon which he resides, or is the owner of property assessed for valuation at the rate of \$500. This act provides that the right to register under these paragraphs shall continue only until January 1, 1915. Measures were passed providing for pensions to ex-Confederate soldiers and widows of such soldiers. Railway companies are prohibited from employing inexperienced engineers. The laws relating to elections were amended, providing additional regulation for primary elections and for registration of voters. Contributions by corporations for election purposes were prohibited. Farms were established to which may be sent persons committed in police courts and juvenile offenders. An act was passed providing for the inspection of foods and drugs. A sanitarium for tuberculosis was authorized.

OFFICERS: Governor, Joseph M. Brown; Secretary of State and ex-officio Commissioner of Public Lands, Philip Cook; Treasurer, J. P. Brown; Comptroller and ex-officio Commissioner of Insurance, W. A. Wright; Adjutant-General, A. J. Scott; Attorney-General, John C. Hart; State School Commissioner, Jessie M. Pound; Commissioner of Agriculture, Thomas G. Hudson—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, William H. Fish; Associate Justices, Horace M. Holden, J. H. Lumpkin, M. W. Beck, Beverly D. Evans and Samuel C. Atkinson; Clerk, Z. D. Harrison—all Democrats.

The State Legislature of 1909 was composed of 44 Democrats in the Senate and 181 Democrats in the House. The State Representatives

in Congress will be found in the section *Congress* of the article **UNITED STATES**.

GEORGIA, UNIVERSITY OF. An institution of higher learning at Athens, Ga., founded in 1785. There were in attendance in 1909 503 students, with a faculty of 138 members. The library contains 35,000 volumes. The requirements for admission were advanced during the year to meet the requirements of the Carnegie Foundation. The productive funds amount to about \$540,000. The president is D. C. Barrow.

GERITES. See **CHEMISTRY, INDUSTRIAL**, paragraph *Explosives*.

GERMAN BAPTIST BRETHREN. See **BRETHREN, CHURCH OF**.

GERMAN EAST AFRICA. A protectorate of Germany on the Indian Ocean, between British East Africa and Portuguese East Africa. The estimated area is 365,000 square miles, and the estimated population 7,000,000, mostly of mixed Bantu race. The European inhabitants in 1908 numbered 2845 (2014 Germans). Along the coast are Arabs, Syrians, and East Indians numbering over 10,000. Estimated populations of the principal towns in 1906 were: Dar-es-Salaam, the capital, 24,000; Tabora, 37,000; Ujiji, 14,000; Tanga, 5690; Bagamoyo, 4980. In 1908 there were thirty-one government schools, with 3367 pupils; Protestant and Catholic mission schools have over 16,500 pupils.

Many minerals, including gold, iron, copper, lead, coal, and various precious stones, are found in the protectorate, and the forests contain many valuable varieties of wood. To some extent the natives cultivate corn, pulse, and bananas, and rear cattle, sheep, and goats. Near the coast the Germans have plantations for various products, including coco-palms, vanilla, coffee, rubber, tobacco, cacao, sugar, tea, and cotton. By means of several experiment stations, the government is attempting to promote agriculture and cattle-raising. Imports and exports in 1907 were valued at 23,806,000 marks (8,973,000 from Germany) and 12,500,000 (6,008,000 to Germany) respectively. At the end of 1907 there were 210 miles of railway and 1500 miles of telegraph. For the year 1909-10 estimated revenue and expenditure balanced at 14,308,037 marks (including Imperial subvention of 3,578,804 marks). In addition the statement of receipts and disbursements include the proceeds of a loan amounting to 17,450,000 marks. The military force in 1909 consisted of 2799 men (2528 natives). The Governor in 1909 was Baron von Rechenberg.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. A religious denomination, which grew from the founding in 1840 at Gravois Settlement, near St. Louis, of the Evangelical Church Association of the West. It was organized by six German pastors for the purpose of making provision for the religious needs of the pioneers, who were largely German immigrants. It united successively with the German Evangelical Church Association of Ohio (1858), the United Evangelical Synod of the East (1860), and the Evangelical Synod of the Northwest (1872), and was ultimately organized as the German Evangelical Synod of North America. Doctrinally, this Synod represents the Prussian union of 1817.

Its articles of faith are for the most part those of the evangelical churches, and in case of disagreement it adheres closely to the passages of Scripture bearing upon the matter in dispute and avails itself of the liberty of conscience prevailing in the Evangelical Church. The strength of the organization, which comprises eighteen districts, covering almost all of the States of the Union and parts of Canada, is greatest in the Central and North Central States. The most recent statistics show 1013 pastors, 1303 churches, 256,895 communicants, 115,006 Sunday school scholars. The total value of church property is \$11,883,194; the amount contributed for the maintenance of churches, \$1,628,439; for church work and benevolences, \$163,276. Foreign missions are actively carried on in the Central provinces of India by 9 missionaries, 7 women missionaries, 57 native helpers and 78 native teachers. Elmhurst College, at Elmhurst, Ill., and Eden Theological Seminary, at St. Louis, are the educational institutions of the denomination. The work of the Synod, which was formerly carried on exclusively in the German language, is now, to a considerable extent, being done in the English language, especially in the larger cities. The official organs of the Church are *Der Friedensbote* and *The Messenger of Peace*. A number of other periodicals, covering all departments of church work, are issued in both languages. The Deaconess work is receiving considerable attention; the mother house is situated in St. Louis. Charitable institutions are maintained for orphans, superannuated ministers and the widows and orphans of deceased ministers in different parts of the Synod.

GERMAN LITERATURE AND DRAMA.

The literary world of Germany has for the past year been in a peculiarly unsettled state. It seems as if the craze of great sellers had been transplanted from America to Germany, for the book-market of that country suddenly manifested alarming symptoms of an adjustment of critical standards to the commercial scale. The illegitimate methods employed in advertising Edward Stilgebauer's *Götz Kraft*, published in 1904, and now in its 68th edition, are an example not yet forgotten. Then came the vogue of the novel filled with advanced thoughts on faith, ethics, love and marriage, which culminated in the sensational success of Frenssen's *Hilligenlei*, published in 1906, and now in its 128th edition. About the same time psychological analysis and sociological interest combined in producing that curious document of auto-vivisection and self-revelation, Margarete Boehme's *Das Tagebuch einer Verlorenen*, published in 1905, and now in its 125th edition. But after the fierce denunciation of the means whereby *Götz Kraft* was launched and interminable discussions of the merits and demerits of *Hilligenlei*, and the morality and immorality of the *Tagebuch einer Verlorenen*, which in the meantime had been followed by a numerous progeny, the public seems to have become less susceptible to the suggestions of the advertising and the reviewers' column and the book-market has resumed its wonted more normal course. Although no connection is evident between the great sellers in fiction and the unusual dramatic successes of the same period, it is interesting to note that these, too, have not been equaled. From the standpoint of the box-office the student-play

Alt-Heidelberg and the anti-militaristic drama *Zapfenstreich*, seem to have had no successors of equal drawing power.

The year 1909 is not likely to be remembered in the literary annals of Germany for the high quality of its productions. Dramatists, novelists, and poets were, perhaps, more than ever engaged in eagerly seeking extraordinary themes and in earnestly striving for novel effects, but their achievements were not commensurate to their endeavors. The taste of the reading public, too, as far as it can be gauged by the record of books most in demand and books most frequently reprinted, showed a marked uncertainty and some puzzling contradictions. While the sensational success of the translation of Artzibaschew's ultra-modern story, *Ssanin*, did not augur well for the spirit of the reading world of the country, it was rather encouraging to learn that its rival in favor was Helen Keller's *Optimism*. It must be admitted, too, that although Sudermann's novel, *Das hohe Lied*, held the first rank among works of native authors during the first month of the year, it gradually fell behind as the more meritorious works of the year, the stories by George Herrmann, Hans Rudolf Bartsch, and Gabriele Reuter slowly worked their way to the front and continued on the list. That the new novel by Gustav Frenssen, *Klaus Hinrich Baas*, would turn out to be the greatest seller of the season of 1909-10 seemed a foregone conclusion, since it had passed the twenty thousand mark within two months after its publication.

DRAMA. The dramatic situation seems hopeless. The powerful revival of German drama in the '90's has been followed by a steady decline, even of those men in whom the hopes of a future centred. It is almost pathetic to witness the repeated efforts of Gerhart Hauptmann to give plastic form and dramatic life either to the elusive fabrics of his own fancy or to the mediæval legends which he exhumes from the dust of ancient chronicles. For though he undoubtedly feels the charm of their simplicity, when he attempts to reproduce them he fills them with the complex elements of his own personality, and the result is painfully inharmonious. The simple lines of the legend which he attempted to re-create in his *Griseldis* were marred and distorted by the addition of traits foreign to the source upon which he based his work, and the critics, who seem to delight in condemning everything that comes from his pen of late, were only too justified in their censure of the work. Hauptmann's great rival, Hermann Sudermann, was no luckier in his recent productions. His *Strandkinder*, though launched in the Berlin Schauspielhaus, which rarely gives up its stage for the first production of modern plays, and based upon a page of mediæval Prussian history appealing to the nationalistic tendencies, was not over warmly received either by the critics or the audience. Wildenbruch's *Der deutsche König*, though it presents the story of Henry I., which never fails to stir a German heart, with additions that betoken the author's lack of imagination and freedom, had a far better reception, and impressed by the honesty and seriousness of its endeavor even such critics that were never in sympathy with the work of the living poet.

Among the dramatists who by their previous

achievements rank next to those leaders of German drama, a tendency to court the favor of the audience by farcical inclinations spoiled what otherwise might have been excellent comedies, like Ludwig Fulda's *Das Exempel* and Ernst von Wolzogen's *Ein unverstandener Mann*. Two men who had once held out the promise of great things have taken another step backwards. Otto Ernst's *Tariff der Patriot* and Max Dreyer's *Pfarrerstochter von Streldorf* gave proof of the hopeless decline of their author's dramatic power. Karl Schönheit, who in the previous year won the Schiller prize, failed to do honor to the prominent position which this distinction gave him, in his four-act comedy, *Über die Brücke*. Frank Wedekind, who, with his gifted wife, plays his own works to audiences that seem to accept everything that comes from his erratic pen, produced a one-act play, *Die Zensur*, without making clear the meaning of the sub-title, "eine Theodizee," or even the purpose of the play itself. Otto Julius Bierbaum, on the other hand, produced at the festivities of the University of Leipsic a charming student comedy, *Der Musenkrieg*. A few rural dramas showed merit, among them Clara Viebig's *Das letzte Glück* and Carl Friedrich Weigand's *Winternacht*. There were several successful attempts at historical drama: Hans von Gumpenberg's *König Konrad I.*, Wilhelm Weigand's *Lorenzino* and Rudolf Herzog's *Der letzte Kaiser*. Hugo Salus made his debut as a dramatist in a fanciful poetic drama, *Römische Komödie*, which owed its success to his lyrical powers. Johann Wiegand's new play, *Der Fall Henner*, a contribution to the school tragedies, which occupy no little space in drama and fiction of contemporary Germany, proved too much of a *Tendenzstück* to achieve a lasting success. Two plays were dramatizations of successful novels: Josef Lauff's *Der Deichgraf*, a historical drama based on his story, *Frau Aleit*; and Hermann Stegemann's *Daniel Junt*, adapted from the author's story of the same name. Hans Müller, whose advent in the dramatic world a year ago held out promise of great achievement, has been led astray by the craze for originality; his satirical comedy, *Hargndl am Bach oder Die Liga der Persönlichkeiten*, proved so dismal a failure, that it endangered the position of the director of the Burgtheatre, Paul Schlenther. A surprise to the hardened critics was the success of Ottomar Enking's provincial comedy, *Das Kind*, a play full of genuine pathos and humor, splendidly drawn characters, and here and there an undernote of Ibsenish philosophy.

FICTION. The new novel by Gustav Frensen, *Klaus Hinrich Baas*, is the first work that has come from him since he rose to the foremost rank among German novelists which presents a well-balanced, harmoniously organic whole, and is not burdened with messages either religious or social. Absolutely free from *Tendenz*, this story of a self-made man, who has risen from the obscurity of an impoverished peasant home in a Frisian village to partnership in a prominent business house in Hamburg, is an admirable achievement in story-telling and character-drawing. The boy, Klaus Hinrich, and his mother, the two women that successively share his life as wives, and even the more subordinate characters are portrayed with a vitality that visualizes and with a sym-

pathy that endears them to the readers. The book is likely to give the author the place in literature that the more exacting critics had so far denied him. A story of the commercial aristocracy of North Germany is Rudolf Herzog's *Hanscaten*. Three families are actively concerned in the plot of the narrative; one whose life is governed by duty, severe and implacable; another inspired with a wholesome joy of living; and between them a third, in which the husband's greed for vulgar pleasure is offset by the wife's ideal aspirations. The atmosphere is breezy and briny; the grip of reality is strong. Thomas Mann's *Königliche Hoheit* is a departure from the author's wonted milieu, that of the patrician society of North German commercial centres. He depicts life at the court of a little German duchy, hopelessly burdened with debt, and draws a sympathetic portrait of the sovereign who saves his country's finances by marrying an American heiress. The story is told with a charming remoteness from any definite locality and is a delightful piece of art. E. von Keyserling's *Beate und Mareile* is the story of a man and two women, admirably contrasting in the latter the resigned self-control of old nobility and the passionate self-will of a low-bred, though fascinating and gifted usurper. Ernst Zahn, the Swiss writer, who has recently come to the fore, is a master of the quiet twilights in which is passed the life of his heroes, people with strong wills and emotions, but fettered by fate and rarely free to realize themselves. Of such a life he tells in *Einsamkeit*. Dietrich Speckmann, another of the recent newcomers who are doing meritorious work, though not on particularly new lines, has given us in *Herzensheilige* a story full of intimate charm and of human sympathy. Hans Rudolf Bartsch admirably portrays in *Elisabeth Kött* a strong artistic personality, and in telling the life of his heroine has not a few moments of dramatic fervor and some descriptive passages of unusual power.

The young person plays an important part in German fiction to-day. Hermann Bahr tells in *Drut* the story of a boy's infatuation for a great actress and the decisive influence which this love has upon his life and character. Out of the alarming number of books that can be defined and labeled school and college tragedies, the novel by the Swiss writer, Emil Ermatinger, *Der Weg ins Leben*, stands out by its simplicity and sincerity and the wholesome lesson conveyed by the hero's experiences. Johannes Schlaf's story, *Am toten Punkt*, has also a youthful hero and son of an impecunious widow; but his coming into the house of an uncle gives to psychopathic research and immediately making him the subject of his studies and experiments, places this book with the undecreasing number of works devoted to the exploitation of repulsively abnormal types. Two new writers have traced the lives of their unusual heroes from childhood to maturity, Josef Zytlau giving us in *Crescenz Bühlert* the story of a girl who is subject to cataleptic attacks, while Hans Kyser in *Der Blumenhöd* relates a life which from boyhood to its end is one succession of misfortunes. But the redeeming feature of these two books is in the delineation of the two characters and their serene acceptance of their uncommonly hard lot. Two of Germany's most gifted women writers have

given us stories of girls' lives that compel attention. Marie Eugenie delle Grazie treats in her novel, *Heilige und Menschen*, the problem of a convent education in a period when the world outside of the convent walls is alive with the ideas of Haeckel, and has constructed a plot of dramatic interest and drawn characters of convincing vitality and strong individuality. Although she has nowhere denied her point of view, she does not obtrude it upon the readers, and the effect of the narrative is thoroughly artistic. Gabriele Reuter in *Sanfte Herzen* delineates with sympathetic insight the more passive and quiet natures that have little chance in the storm and stress of strenuous present day life. Hers is a book of a rare intimate charm.

The productiveness of some authors is amazing. George von Ompteda is among those who have published two books within the year: *Droesigl* is a story of bourgeois ambition and aristocratic shiftlessness, in which the well-worn theme is redeemed by the cleverly individualized figure of the climber-hero; *Excelsior* is a story of the Alps full of the spell of altitude. Richard Voss, the indefatigable, has also two stories to his credit, one of which treats the more tragic aspects of Alpinism—*Alpentragödie*. Nor has Paul Heyse failed to give us the book to which one has come to look forward every year—*Die Geburt der Venus*. Contemporary history furnishes the background of Königsbrun-Schaup's *Die Bogumilen*, a story of Bosnia, and of Helene Mühlau's *Liviana Saltern-Santos*, of which the Chilean leader, Balmacedas, is the hero. Other authors have gone back to mediæval themes, as Emil Lucka in his story, *Isolde Weisshand*, August Sperl in *Richtza*, and Bruno Wille in *Die Abendburg*, a story of the Crusades, full of the adventurous atmosphere of the period, but with an ethical meaning for all times. The venerable Julius Wolff has contributed a novel which derives its title, *Der Sachsenpiegel*, from a code of civic law, traces whereof still subsist in Northern Germany. Apart from all these stands Ludwig Ganghofer's *Lebenslauf eines Optimisten*, a charming book of childhood, presumably auto-biographical.

Among the volumes of short stories, Otto Julius Bierbaum's *Sonderbare Geschichten* are fair specimens of the author's quaint and capricious originality; Hermann Stehr's *Drei Nächte* reflects the seriousness and sincerity of the writer, whose stories have done as much for Silesia as Gerhart Hauptmann's plays; Keyserling's *Bunte Herzen*, like his novels, deal with lives that pulsate with the intensity of passion; while the stories of Rudolf Stratz collected under the title, *In zwölfter Stunde*, are full of the gruesome spirit of the hour of spooks. A book distinct from all these by subject-matter and style is *Murimellen*, by Wilhelm Fischer, a book of tales of charming simplicity, rippling on like the river from which they derive their title among scenes of rural life remote from the world. Otto Ernst's book, *Vom grüngoldnen Baum*, is a volume of trifles as disappointing to admirers of his *Asmus Semper* as his latest play to those who applauded *Flachsmann als Erzieher*. Adolf Wilbrandt's pen is never idle, though his recent books, including *Op. 23 und andere Geschichten*, fall short of one's expectations. Rosegger's *Lasset uns von Liebe reden* bears the pathetic sub-

title, *Letzte Geschichten*, and Lilieneron's posthumous volume is called *Letzte Ernte*.

POETRY. Books of verse have been numerous, but their quality only deepens the regret that the little volume entitled *Gute Nacht* is to be the last to bear a name dearer than any other to the present generation, and probably the only one that will survive, Detlev von Liliencron. Germany has lost in him the strongest and sanest personality of the modern school and its most inspired poet. Other posthumous volumes of unusual interest were the epic poem, *Das Alexanderlied*, by the poet-painter of Bremen, Arthur Fitger; *Scin und Schein*, by Wilhelm Busch, and *Letzte Gedichte*, by Ernst von Wildenbruch. There have been volumes of lyrics by Bruno Wille, Rainer Maria Rilke, Alfred Mombert, Wilhelm Weigand, Richard Schaukal and Hans Bethge, all of them writers of established position in the world of German poetry. Hans Müller's book, *Die Rosenlaute*, shows a less marked physiognomy than his stories and plays. Hans Kyser's *Einkehr* has much of the spirituality that distinguished his story. Hans von Wolzogen, the faithful champion of Richard Wagner, has published a book of religious verse. Max Geissler's *Soldaten-Balladen* have in them the possibility of popularity. Gustav Schiller's *Gottesucher-Lieder*, on the contrary, appeals to the few. A book of verse by Christian Wagner, a poet who about a dozen years ago sprung from the people, *Späte Garben*, is distinguished by a wholesome philosophy and by simple dignity of language. Epic poems have been rather more plentiful. Richard Zozmann has written *Dantes letzte Tage*, Max Geissler *Die Rose von Schottland*, and Waldemar Bonsels *Don Juans Tod*. But the most important work coming under this head is Hans Benzmann's book of Christ poems, *Eine Evangelienharmonie*. Among the anthologies may be mentioned a selection of variety verse: *Die zehnte Muse*, compiled by Maximilian Bern; a volume of folksongs, *Der Lindenbaum*, edited by Hermann Hesse, Emil Strauss, and Martin Lang, and a volume, *Neue deutsche Gedichte*, published for the benefit of the Richard Wagner scholarship fund.

MISCELLANEOUS. The *causerie* in which the French excel and which is rather foreign to the more ponderous pace of German prose, has been successfully employed by Georg Herrmann in a thoughtful little book called *Schneeskript*. More ambitious and less graceful in style was Arno Nadel's book, *Aus letzten und vorletzten Gründen*. Marie Ebner-Eschenbach has also collected a little book of prose sketches and aphorisms and appropriately called it *Spätsommer*. Wilhelm Bölsche, who as a nature writer occupies a unique position, published a book of thoughts on nature and art—*Auf dem Menschenstern*. Karl Scheffler's essays, *Idealisten*, contain no little criticism of modern Germany. Alexander von Gleichen-Russwurm has written on social customs in *Geselligkeit, Sitten und Gebräuche der europäischen Welt*. The sketches in Felix Salten's book, *Das österreichische Antlitz*, offer an interesting interpretation of the Austrian temperament. Unusually rich in suggestion are these books of travel: Hermann Bahr's *Dalmatinische Reise*, Meyer Graefe's *Spanische Reise*, and Karl Scheffler's *Paris*. In a book called *Eroberer*, Ludwig Brinkmann attempts an interpretation of the American people.

BIOGRAPHY. Eduard Engel's *Goethe—der Mann und sein Werk* heads the list of numerous contributions to Goethe biography, among them his correspondence with the Humboldts, with Frau von Stein and other friends, the letters of his mother, and a group of character sketches by Gertrud Baeumer, Dr. phil.: *Goethes Freundinnen*. There have been popular editions of Theobald Ziegler's life of *Schiller*, and numerous volumes of letters, among them those of Schiller's youth, selections from his correspondence with Charlotte von Lengefeld before their marriage, and a volume of her own letters to her friends. A work of literary and human interest is the first inclusive biography of Johann Christian Guenther, based upon the diaries of the erratic genius. S. Rahmer has written a book on *Kleist als Mensch und Dichter*, and Friedrich Hebbel has been made the subject of studies by Oskar F. Walzel, Anna Schapire and others. Artistically, Josef Ettlinger's *Benjamin Constant* ranks highest in this year's biographies. Gustav Karpeles has given us the memoirs of Heine, based upon letters and diaries. A study of the personality of Wilhelm von Polenz, by Adolf Bartels, has been published simultaneously with an edition of the complete works of von Polenz. Friedrich Paulsen tells the story of his youth in a volume entitled *Aus meinem Leben*.

HISTORIES OF LITERATURE, CRITICISMS, ETC. Eduard Engel has written a brief and popular history of *German Literature*; Dr. Leon Kellner a history of *English Literature in the Victorian Reign*. Karl Wolfskehl and Friedrich von der Leyen have edited the oldest specimens of German poetry, and Richard M. Meyer a selection of folksongs and church hymns—*Meisterstücke des deutschen Volks- und Kirchenliedes*. German Shakespeare literature has been increased by Alexander von Gleichen-Russwurm's *Shakspeares Frauengestalten* and a series of studies by Arthur Boehlingk, *Shakespeare und unsre Klassiker*. Ricarda Hush's *Risorgimento* is a volume of strongly drawn portraits from modern Italian history. Max Nordau is the author of *Der Sinn der Geschichte*.

Since bookmaking is being considered more as an art, new editions of old works have multiplied at an amazing rate. Translations from foreign authors, classical and modern, are far more numerous on the German than on the American or English book market. Of English authors, George Bernard Shaw is the one whose works are now immediately converted into German; editions of the works of Oscar Wilde are much in demand. George Meredith, too, is being translated. Among American writers thus distinguished are Ralph Waldo Trine and Gerald Stanley Lee.

GERMAN METHODIST CHURCH. See *EVANGELICAL ASSOCIATION*.

GERMAN NEW GUINEA, or KAISER WILHELM LAND. A protectorate of Germany, in the northwestern part of the island of New Guinea. Estimated area, about 70,100 square miles; estimated population, about 110,000. In 1908 there were over 200 foreign colored inhabitants (mostly Chinese) and 184 whites (162 Germans). The cultivated area is reported at only 4781 hectares, planted chiefly to coco-palms and rubber. In 1907 imports amounted to 815,000 marks; exports, 303,000

marks (mostly copra). Estimated revenue for 1908-09 balanced at 1,523,409 marks (including Imperial subvention of 1,141,569 marks); for 1909-10, 1,722,225 marks (subvention, 1,065,000 marks). The seat of government is Herbertshöhe, in the Bismarck Archipelago. Attached to German New Guinea, for administrative purposes, are the Bismarck Archipelago, the Caroline Islands, the German Solomon Islands, the Ladrones Islands, and the Marshall Islands.

GERMAN REFORMED CHURCH. See *REFORMED CHURCH IN THE UNITED STATES (GERMAN)*.

GERMAN SAMOA. A dependency of Germany in the southern Pacific, including Savaii and Upolu (the two largest of the Samoan Islands) and several small adjacent islands. Savaii has an area of 660 square miles and a population (1906) of 12,816; Upolu, area, 340 square miles, and population (1906), including Manono and Apolirna, 20,662. In 1908 there were 1050 Chinese, 938 other foreign colored, and 436 whites (261 Germans). The native inhabitants are nominally Christian. Mission schools have over 8000 pupils. Cacao and rubber are cultivated, but the chief product is copra. The white planters depend largely upon Chinese labor. Copra and cocoa beans are the leading exports. The principal imports are haberdashery, kerosene, provisions, etc. Imports and exports in 1908 amounted to 2,889,000 marks and 3,026,000 marks respectively; in 1907, 2,825,957 marks and 1,769,800 marks respectively. Estimated revenue and expenditure for 1909-10 balanced at 763,530 marks. The residence of the Governor is at Apia, formerly the capital of the Samoan kingdom.

GERMAN SOLOMON ISLANDS. The islands of Bougainville and Buka, east of the Bismarck Archipelago, accorded to Germany in November, 1899, and attached administratively to German New Guinea. Area, about 4500 square miles; population, about 45,000. The chief commercial products are tortoise shell and sandalwood.

GERMAN SOUTHWEST AFRICA. A protectorate of Germany on the Atlantic, between Portuguese West Africa and British South Africa (excepting Walvisch Bay, which belongs to Cape Colony). Estimated area, 317,950 square miles; estimated population, about 200,000 (Hottentots, Bushmen, Bantus, and Damaras). The natives, especially the Hottentots and Damaras, have repeatedly made vigorous resistance to German occupation. There was a European population of 8213 (6215 Germans) in 1908, when the military force numbered about 4600 men. There are several small government schools, while mission schools have about 3000 pupils. Government experiment stations encourage farming, gardening, and forestry, and some cotton, tobacco, wine, fruits, and vegetables are produced. But agriculture is backward, the chief industry being pastoral. In 1908 live-stock included 193,200 sheep; 73,331 cattle, 160,237 goats (3956 angora), 6533 horses, 5800 mules, 2298 asses, 2258 swine, 297 camels. The southern and much of the eastern part of the protectorate is barren. Copper is mined in the Otavi region. In 1908 diamonds were discovered near Lüderitz Bay and a company was formed for working the field. From

September to December in that year the output was valued at about \$268,000. In 1907 imports were valued at 32,396,000 marks (25,790,000 from Germany), and exports 1,616,000 marks (1,524,000 to Germany). In July, 1908, the Lüderitz Bay-Keetmanshoop Railway was completed, the total mileage open to traffic in the protectorate being 780, and 106 miles were still under construction. Estimated revenue and expenditure for 1909-10 balanced at 31,029,816 marks (17,124,914 marks Imperial subvention). The seat of government is at Windhoek. Thousands were attracted to the country in 1909 by the diamond mining. A great improvement in the quality as well as an increase in the quantity of the stones found was reported. Many new companies were formed.

GERMANY. An empire of Europe extending from France to Russia. The capital is Berlin.

AREA AND POPULATION. The area in square miles and the population, according to the census of December 1, 1905, of the twenty-five German states and the Reichsland of Alsace-Lorraine are as follows:

States	Area	Population	Pop. per sq.m.
Prussia	134,623	37,293,324	277.3
Bavaria	29,282	6,524,373	222.7
Württemberg	7,828	2,302,179	305.5
Baden	5,821	2,010,728	345.3
Saxony	5,787	4,508,601	778.8
Mecklenburg-Schwerin	5,135	625,045	123.3
Hesse	2,965	1,209,175	407.6
Oldenburg	2,479	438,856	176.8
Brunswick	1,424	455,958	342.5
Saxe-Weimar	1,388	388,095	277.8
Mecklenburg-Strelitz	1,131	103,451	91.5
Saxe-Meiningen	953	268,916	282.2
Anhalt	906	328,029	369.4
Saxe-Coburg-Gotha	755	242,432	317.3
Saxe-Altenburg	511	206,508	404.1
Lippe	469	145,577	310.4
Waldeck	433	59,127	136.5
Schwarzburg-Rudolstadt	363	96,825	266.7
" Sondershausen	333	85,152	255.7
Reuss Younger Line	319	144,584	453.2
Schaumburg-Lippe	131	44,992	343.4
Reuss Elder Line	122	70,603	578.7
Hamburg	158	874,878	5467.9
Lübeck	115	105,857	920.5
Bremen	99	263,440	2661.0
Alsace-Lorraine	5,600	1,814,564	323.8
Total	208,830	60,641,278	290.4

According to the occupation-census of June 11, 1907, the population of the empire was 61,720,529; the estimated population on June 30, 1908, was 62,982,000, and on June 30, 1909, 63,886,000. The 1907 occupation-census showed the following results, the first column indicating the number of persons directly engaged, the second the number indirectly engaged (including domestic servants), and the third the total, in the given occupations:

Manufacturing	10,292,976	13,111,400	23,404,376
Agriculture	9,732,472	7,510,463	17,242,935
Commerce, trans- portation, etc....	3,477,626	4,800,613	8,278,239
Mining	963,278	2,018,853	2,982,161
Professions	1,087,336	1,539,424	2,626,760
Various service, ex- clusive household	471,695	321,058	792,748
Army and navy	651,194	129,172	780,366
Forestry, fish'g, etc	150,785	287,456	438,241
Without occupation	3,404,983	1,769,720	5,174,703
Total	30,232,345	31,488,184	61,720,529

In 1907 there were 503,964 marriages, 2,060,973 births (including stillbirths), 1,178,349 deaths (including stillbirths), and 61,040, still-births. The number of emigrants in 1907 was 31,696 (30,431 to the United States); in 1908, 19,883 (17,951 to the United States). The larger cities, with population in 1905, are: Berlin, 2,040,148; Hamburg, 802,793; Munich, 538,983; Dresden, 516,996; Leipzig, 503,672; Breslau, 470,904; Cologne, 428,722.

EDUCATION. Education in Germany is free and compulsory, and the number of illiterates is almost negligible. In 1906 public elementary schools numbered 60,584, with 166,597 teachers (29,384 female) and 9,737,262 pupils; private elementary schools, 614, with 42,004 pupils. Expenditure on the public elementary schools amounted to 522,861,000 marks. Secondary (1908) are reported as follows: Gymnasia 499; progmynasia, 83; realgymnasia, 138; realschulen, 338; oberrealschulen, 86; public normal schools, 226; other public schools, 35; private schools, 56. The ten State-aided technical high schools (of collegiate rank) had in 1908 an aggregate teaching staff of 753, with 14,149 students. There are large numbers of institutions for various special or technical instruction. The 21 universities had in the winter of 1907-8 46,471 matriculated students (320 women) and 5053 non-matriculated students (2486 women).

AGRICULTURE. Although Germany virtually supports nine-tenths of her population by her own produce, the empire is becoming more and more a manufacturing country, and, with the continuous increase of population, the question of food supply is a constant and pressing one. In 1907 27.95 per cent. of the population were supported by agriculture, against 34.9 per cent. in 1895; the corresponding figures for manufacturing are 37.92 and 35.52 respectively; for commerce and transportation, 13.41 and 11.52 respectively; for mining, 4.83 and 3.57 respectively. In 1900 48.6 per cent. of the total area was under cultivation, 16 per cent. consisted of meadow and pasture, and 26 per cent. forest. The principal German corps are shown in the table on page 286, the production in 1906 and 1907 being given and the area in acres and the production in 1908 and 1909.

The estimated acreage under sugar beets in 1909 was 1,074,622, and the production 11,719,931 tons. Wine production in 1908 was placed at 3,135,053 hectolitres, valued at 126,811,000 marks; tobacco, in 1907, 28,839,814 kilos; hops, in 1907, 26,340,000 kilos. On December 2, 1907, the live-stock in the empire were numbered as follows: Horses, 4,345,043; mules and asses, 10,991; cattle, 20,630,544; sheep, 7,703,710; swine, 22,146,532; goats, 3,533,970. The number of animals slaughtered for food in 1907 was as follows: Calves up to three months old, 4,378,742; bovines over three months, 3,748,282; sheep and lambs, 2,776,790; swine, 22,469,000; goats, 1,197,799; horses, 135,775; dogs, 6461. See **AGRICULTURE**.

FORESTRY. The empire has nearly 35,000,000 acres of forest, of which 31.9 per cent. belongs to the state. Of the whole forest area, about one-third is under foliage trees and about two-thirds under conifers. German scientific forestry has resulted in raising the average yield of wood per acre from 20 cubic feet in 1850 to 65 cubic feet in 1904, and in trebling the pro-

portion of the saw timber secured from the average cut. During the same period the money returns from an average acre of forest increased seven-fold. At present the German forests are probably in better condition than ever before. See FORESTRY.

MINERALS AND METALS. German figures for mineral and metal production include those of the Grand Duchy of Luxemburg. The total amount of minerals raised in 1906 was valued at 1,637,000,000 marks; in 1907, 1,845,000,000 marks. The following table shows the values, in thousands of marks, of the principal mineral products in 1907 and 1908, with quantities, in metric tons, for the latter year:

Minerals	1908		
	1907 1000 marks	Metric tons	1000 marks
Coal	1,394,271	148,537,417	1,631,740
Lignite	156,347	66,746,057	169,878
Graphite	201	4,844	248

Finished cast iron products	1,319,254	8,125,749	1,164,626

FISHERIES. Exclusive of herring to be salted, the catch in 1907 was valued as follows: From the North Sea, 14,166,657 marks (provisional); from the Baltic, 6,233,050 marks; total, 20,399,707 marks.

MANUFACTURES. The trend of population continues away from the farm to the factory. And there is a constant tendency toward the development of larger industrial establishments. The small factory is being absorbed by the combination. The occupation, or industrial, census of June, 1907, shows that the number of industrial employees in that year had increased, as compared with 1895, in a ratio about four times that of the firms employing them, and the proportionate increase of female employees was greater than that of male. The cost of living in Germany has risen along with the increasing population, the movement from country to city, and the development of capital combination; so that, according to the results of an investigation recently conducted by the Imperial government, there is at present the narrowest margin between the income of the

German workingman and the cost of his actual necessities. It appears that Germany has taken a place in the first rank of manufacture at a peculiarly heavy price paid by the German people.

The following statistics of the textile industry of Germany are given in the *Imperial Yearbook* for 1909:

Classification	Firms	Work-men	Work-women
Preparation of spinning			
and fibre material.....	1,012	11,435	11,363
Spinning	3,545	82,711	124,314
Weaving	67,484	249,718	236,738
Hair plaiting and weaving	653	2,649	1,813
Hosiery	30,842	39,280	64,716
Lace	27,334	26,199	53,030
Bleaching, dyeing, printing	12,191	82,481	36,614
Fringe making	11,570	15,216	20,099
Roping	5,976	15,882	7,734
Felt and blanket making	611	4,338	2,960
Total	161,218	529,909	558,381

crease in 1908. In 1906-7 there were 65,405 distilleries in operation, producing 3,841,207 hectolitres of alcohol; in 1907-8, 66,745 distilleries, producing 4,018,311 hectolitres.

COMMERCE. The laws and rules of the German Customs Union (Zollverein), up to March 1, 1906, applied to all the states of the empire, excepting the free ports of Hamburg, Bremerhaven, Cuxhaven, and Geestemünde, a few districts of Baden (with less than 4000 inhabitants) on the Swiss frontier, and the island of Helgoland; included in the customs territory (Zollgebiet) were the Grand Duchy of Luxembourg and the Austrian communes of Jungholz and Mittelberg. On March 1, 1906, the customs territory, retaining all of its area at that time, was enlarged so as to include all Germany excepting the Baden districts above mentioned and Helgoland. In the special trade (imports for consumption and exports of domestic produce), the total imports and exports in marks are shown in the table below.

The general classification of the imports and

Special trade	1906	1907	1908
Imports:			
Merchandise	8,021,891,000	8,746,678,000	7,664,021,000
Precious metals	416,663,000	256,645,000	413,072,000
Total	8,438,554,000	9,003,323,000	8,077,093,000
Exports:			
Merchandise	6,359,029,000	6,850,890,000	6,398,527,000
Precious metals	118,579,000	249,693,000	82,926,000
Total	6,478,608,000	7,100,583,000	6,481,453,000

On March 1, 1909, the estimated number of cotton spindles in operation was 9,881,321, and in construction 416,258; the number in operation in Germany was exceeded only by that in the United Kingdom (53,471,897) and in the United States (27,846,000). During the year ending August 31, 1908, the mill consumption of cotton was 1,793,180 bales. Finished products of iron and steel in 1907 were valued at 1,952,000,000 marks, against 1,754,000,000 marks in 1906. In 1909 reports of the leading iron and steel works showed an average decrease of profits of about 7 per cent. as compared with 1908. At the end of 1907 there were 8618 chemical factories, with 207,000 operatives. In the ceramic industry there is a union of 101 factories; reports from the majority of these in 1909 showed a serious depression of business. The reported number of glass-works in 1908 was 374, with 62,159 employees. The shipbuilding industry in 1908 was not prosperous; during that year there were 99 (against 435 in 1907) sea-going steamships, of 147,270 gross tons, built in German shipyards; at the end of the year 67, of 187,362 tons, were in course of construction. For 1907 the output of the German toy industry, which centres at Nuremberg, was valued at about \$25,000,000. The paper industry suffered depression in both 1908 and 1909. In the year 1907-8 the production of raw (beet) sugar amounted to 1,842,092 tons; refined (beet) sugar, 1,566,895 tons; quantity of beets used 13,491,424 tons. In the year ending March 31, 1907, beer production was as follows: Beer excise district, 45,867,000 hectolitres; Bavaria, 18,364,000; Württemberg, 4,017,000; Baden, 3,278,000; Alsace-Lorraine, 1,381,000; total, 73,159,000; the Bavarian production showed a slight de-

exports of merchandise in 1907 and 1908 was as follows, in millions of marks:

Classes	1907		1908	
Imp.	Exp.	Imp.	Exp.	
Food substances.....	2,217.9	539.9	2,042.6	679.8
Live animals.....	226.8	11.8	224.6	9.5
Raw materials.....	4,910.4	1,656.4	4,154.2	1,577.2
Manufactures	1,391.6	4,638.1	1,242.6	4,182.1
Total	8,746.7	6,845.2	7,664.0	6,398.6

The principal articles of merchandise entered for consumption in 1908 were valued, in millions of marks, as follows: Cereals, 784.1; cotton, 502.5; hides and skins, 392.8; wool, 390.5; coal, 271.8; chemicals and drugs, 264.1; timber, lumber, etc., 244.6; copper, 198; coffee, 163.6; silk, 157.4; iron, 142.1; eggs, 137; fruits, 129.8 (tropical fruits, 63.7); leaf tobacco, 125.5; wheat products, 118.5; linseed, 101.2; animal fats, 99; rubber and gutta-percha, 98.7; rice, 97.8; woolen yarn, 97.5; cotton yarn, 87.8; fish, 85.9; oil-cake, 85.9; cocoanuts and copra, 76.3; flax and hemp, 76; petroleum, 75.3; butter, 72.7; machinery, 68.5; other iron manufactures, 65.2; silk goods, 64.5; lead, 45.8; cacao, 45.5.

The values, in millions of marks, of the leading domestic exports in 1908 were: Iron manufactures (excepting machinery), 704.3; machinery, 415.9; coal, 398.9; cotton goods, 350.2; chemicals and drugs, 331.7; woolen goods, 258.7; cereals, 224.2; dyes and colors, 208.7; apparel, 196.8; sugar, 195.7; paper, 184.3; electrical apparatus, etc., 177.3; pottery, 174.8; silk goods, 167; leather, 165.1; pelts, etc., 114.1; hides and skins, 111.2; gold and silver manufactures, 107; glass and glassware, 104.1; copper manufactures, 102.5; ships, 97.8; wool, 94.8; leather

manufactures, 77.4; toys, 68.8; woolen yarn, 66.1; books, maps, etc., 61.8; musical instruments, 56.6; cotton (raw and waste), 56.5.

In 1907 and 1908 the special commerce (exclusive of precious metals) with the principal countries of origin and destination was valued, in millions of marks, as follows:

Countries	1907		1908	
	Imp.	Exp.	Imp.	Exp.
United States	1,319.8	652.3	1,282.6	507.5
Russia	1,069.9	433.3	920.8	505.5
Austria-Hungary	812.3	716.6	751.4	738.8

German colonies..	22.2	36.8	22.8	35.5

Provisional figures for the first six months of 1909 showed an increase of about 169,000,000 marks in imports and about 94,000,000 marks in exports over the corresponding period of 1908.

SHIPPING. The following figures for shipping relate to 1907; they include vessels in both the foreign and the coasting trade, but a vessel entering more than one port on a single voyage is counted only once. Total entrances, 104,128 vessels, of 28,054,646 tons net; 93,402 vessels, of 26,110,154 tons, entered with cargo; 10,663 vessels, of 1,944,492 tons, entered in ballast; 69,355 vessels, of 25,182,869 tons, were steamers. Total clearances, 104,051 vessels, of 28,074,365 tons net; 75,819 vessels, of 17,888,818 tons, cleared with cargo; 28,883 vessels, of 10,185,549 tons, cleared in ballast; 69,650 vessels, of 25,205,466 tons, were steamers. Of the total entrances, 79,523 vessels, of 15,821,653 tons, were German (53,980 steamers, of 13,878,412 tons); and 24,602 vessels, of 12,232,993 tons, were foreign (15,375 steamers, of 11,304,457 tons). Of the total clearances, 80,150 vessels, of 15,877,400 tons, were German (54,294 steamers, of 13,924,400 tons); and 24,501 vessels, of 12,196,905 tons, were foreign (15,356 steamers, of 11,281,006 tons). Of the foreign net tonnage entered and cleared nearly one-half was British and nearly one-fifth Danish.

The merchant marine on January 1, 1909, consisted of 4638 vessels, of 2,825,404 tons net, with crews numbering 72,450 (including 1953 steamers, of 2,302,910 tons, with 58,451 men). The vessels registered at North Sea ports numbered 3712, of 2,529,878 tons, with 64,139 men; those registered at Baltic ports numbered 926, of

295,526 tons, with 8311 men. Of the total, Hamburg had 1315 vessels, of 1,563,896 tons, with 32,446 men (707 steamers, of 1,288,278 tons, with 27,877 men); Bremen, 724 vessels, of 837,245 tons, with 22,841 men (462 steamers, of 676,213 tons, with 20,230 men); and Prussia, 2238 vessels, of 283,053 tons, with 13,152 men (631 steamers, of 218,148 tons, with 7709 men). On January 1, 1908, the merchant marine consisted of 4571 vessels, of 2,790,435 tons, with 71,853 men.

COMMUNICATIONS. The total length of railways in the empire on August 1, 1909, was 37,094 miles, of which 34,286 miles were owned or operated by the states. Of the total, 35,808 miles were standard gauge, and 1286 miles narrow gauge. Of government line, Prussia was credited with 22,825 miles; Bavaria, 4740; Saxony, 2034; Alsace-Lorraine, 1222; Württemberg, 1128; Baden, 1078. At the end of 1907 68.1 per cent. of the mileage was comprised in trunk lines, and 31.9 per cent. in auxiliary lines. On that date the standard-gauge roads had 24,259 locomotives, 50,097 passenger cars, and 511,150 freight and baggage cars, showing an increase of 43.7, 48.8, and 41.4 per cent. respectively over 1897. The total freight receipts (of the standard-gauge lines) in 1907 amounted to 1,783,720,000 marks, showing an increase of 59.6 per cent. over 1897; receipts from passenger traffic, 747,940,000 marks, showing an increase 58.2 per cent. A similar development during the decade is shown in the narrow-gauge roads. In 1904 the empire had over 8500 miles of inland navigable waterways. In 1909 it was reported that in the last twenty years Germany had expended \$150,000,000 on her waterways, and that the German-Austrian and Rhine-Elbe canals, already begun, contemplate the expenditure of nearly \$350,000,000. In 1908 there were in the empire 41,276 telegraph offices, with 130,772 miles of line and 386,438 miles of wire. Post-offices (1908) numbered 40,566.

FINANCE. The unit of value is the mark, worth 23.8 cents. For the fiscal year ending March 31, 1907, the Imperial revenue amounted to 2,376,813,000 marks (2,111,867,000 ordinary and 264,746,000 extraordinary); expenditure, 2,392,409,000 marks (2,157,354,000 ordinary and 235,145,000 extraordinary). Estimated revenue and expenditure, in thousands of marks, have balanced as follows, for fiscal years ending March 31:

	1908	1909	1910
Ordinary	2,339,291	2,615,397	2,630,369
Extraordinary	257,501	234,617	235,040
Total	2,596,792	2,850,014	2,865,409

For the fiscal year 1910, the principal items of estimated ordinary revenue were: Customs and excise duties, 1,203,278,000 marks; posts and telegraphs, 672,448,000; Federal contributions (paid in by the several states in proportion to population), 426,889,000; railways, 123,291,000. The larger estimated ordinary expenditures were: Army, 778,321,000 marks; posts and telegraphs, 590,034,000; treasury, 329,293,000; navy, 301,482,000; debt, 171,487,000; pension fund, 115,110,000; railways, 102,234,000.

At the end of 1907 the interest-bearing debt of the empire amounted to 4,003,500,000 marks, having increased by 200,000,000 marks during

the year; the non-interest-bearing debt, consisting of treasury bonds and paper money, stood at 594,000,000 marks, having increased by 84,000,000 marks during the year; total debt, 4,507,500,000 marks. As a partial offset against the debt there are several invested funds; the fund for invalids, on March 31, 1909, amounted to 130,189,835 marks; the war treasure fund (not invested, but preserved in gold), 120,000,000 marks. The empire came into existence in 1871 free of debt and with the enormous French war indemnity at its disposal. From 1900 to 1908 the actual total revenue fell short of the actual total expenditure so as to necessitate loans amounting to some 1,600,000,000 marks, and the burden of taxation, direct or indirect, is becoming heavier year by year.

The Imperial coinage (less amounts withdrawn) from 1871 to March 31, 1907, was as follows: Gold, 4,349,117,600 marks; silver, 850,789,200; nickel, 78,797,200; copper, 18,969,400; total, 5,297,673,400. The average financial condition of the five banks of issue in 1906 was: Liabilities: capital, 235,500,000 marks; reserve fund, 78,104; notes in circulation, 1,531,304,000; total (including other liabilities), 2,540,225,000. Assets: coin and bullion, 959,308,000 marks; notes of state and other banks, 75,975,000; bills, 1,104,051,000; total (including the assets), 2,540,225,000.

NAVY. The following figures relate to the effective navy. In 1909 there were 22 first-class battleships, and 8 under construction; 4 second-class battleships; 9 armored cruisers, and 3 under construction. The total tonnage of these 46 vessels is 654,334. The number and displacement of warships, built and building, of 1000 or more tons, and of torpedo craft of more than 50 tons, were as follows in 1909: Battleships of 10,000 tons and over, 32, aggregating 436,424 tons; armored cruisers, 12, of 151,693 tons; coast-defense vessels, 6, of 32,378 tons; cruisers 6000 to 3000 tons, 26, of 105,293 tons; cruisers 3000 to 1000 tons, 17, of 37,626 tons; torpedo-boat destroyers, 97, of 49,859 tons; torpedo boats, 33, of 5819 tons; submarines, 8, of 1800 tons; total 233 war vessels, of 820,892 tons. See NAVAL PROGRESS AND BATTLESHIPS.

ARMY. Military service is compulsory and universal, every German called upon to bear arms being liable to serve for 7 years in the regular army, two years of which, or in the case of the cavalry and horse artillery 3 years, are spent in the ranks and 5 or 4 years as the case may be with the army reserve. Then follows 5 years (3 years for cavalry and horse artillery) in the first ban of the Landwehr second line army, which involves two trainings of 14 days each for the dismounted branches only. Then comes service with the second ban to the soldier's 40th year, but without training periods, and finally he passes to the Landsturm or Home Defense Army, second ban, until he completes his 45th year. More men are recruited annually than are needed for the regular army and these are sent to the Ersatz Reserve where they undergo three trainings of 10, 6, and 4 weeks, and then pass to the Landsturm; or they may be enrolled at once in the Landsturm, first ban, which comprises all able-bodied men from 17 to 39 who have not served otherwise. The second ban is formed of those between 40 and 45 years of age. An important part of the organization are the "One-Year

Volunteers" who pay all their expenses and after training become eligible to act as officers in the Reserve and Landwehr. These numbered about 11,000 in 1909. In 1909 the German army was organized in 23 army corps in which were included the corps of guards and 3 Bavarian Corps. There were 216 regiments (615 battalions) of infantry and 18 battalions of chasseurs; 16 machine gun sections, 100 regiments (500 squadrons) of cavalry; 94 regiments (583 batteries) of field artillery; 18 regiments of garrison artillery; 29 battalions of engineers; 30 companies of railway troops; 1 battalion of balloon troops; 1 company for testing, and 23 battalions of train. This army or first line on a peace footing amounted October 1, 1909, to 621,153, all ranks (25,559 officers, 85,450 non-commissioned officers, 503,705 men, and 6409 medical pay and other officers and men) and with it would be available 111,820 horses. To this quota the various states of the Empire contribute as follows: Prussia, 482,718; Saxony, 45,735; Württemberg, 24,102; Bavaria, 68,559.

In time of war to form a Field Army the regular establishment would be augmented by the addition of a reserve division to each of the 23 army corps and 11 cavalry divisions, so that the force as organized would comprise 962 battalions of infantry, 479 squadrons of cavalry, 828 batteries of artillery, 16 machine gun sections, 95 companies of engineers, affording a total strength of 984,000 infantry, 72,000 cavalry, 4968 field guns and 96 machine guns, or a total of about 1,165,000 men. The organized Landwehr was estimated at about 600,000, and the garrison troops of the Landwehr, the Ersatz and Landsturm at about 2,000,000, so that the total war strength of Germany could be stated at about 4,330,000 men.

The year 1909 witnessed the culmination of the increase of the army arranged for under the Army Law of April 1, 1905, which provided for an annual increase until a strength of 505,839 men, exclusive of one year volunteers, was reached. The new formation for 1909 dating from October 1 of that year were two battalions of infantry which completed the organization provided for. The military budget for 1908-10 amounted to £33,573,000 for permanent charges and £4,938,000 for special expenditure. These items with the extraordinary budget of £2,082,000 and a charge of £72,000 for military law made a total appropriation of £40,065,000 voted for military expenditures. This was a decrease of £2,113,000 from the military budget of the previous year and included a reduction on various special expenditures amounting to £300,000 made in the Reichstag, the first time such action had been taken in many years. New field uniforms for the German army were issued during the year and are the result of a long series of trials and experiments. The color is silver-gray and there is no difference in pattern and make for officers' uniforms over those of the rank and file, the badges of rank which are small, being worn on the collar and shoulders and being inconspicuous except at close distance.

GOVERNMENT. The executive authority is vested in the King of Prussia under the title of German Emperor. The Emperor in 1909, was William II., who was born January 27, 1859, and ascended the throne June 15, 1888. The heir-apparent is Prince Frederick William,

born in 1882. The Imperial ministers, appointed by the Emperor, do not form a single body (cabinet), but manage their departments independently of one another; all, however, are under the supervision of the Imperial Chancellor, who, unlike them, is not responsible to the Imperial legislature. This body consists of an upper house, or Bundesrat, which is presided over by the Chancellor, and a lower house, or Reichstag. Members of the former (58) are chosen by the governments of the several states and those of the latter (397) are elected by popular vote. The Imperial Chancellor in 1900 was Theobald von Bethmann-Hollweg. The Imperial Ministers, or Secretaries of State, were: Foreign Affairs, Wilhelm von Schoen; Interior, Herr Delbrück; Colonies, Herr Dernburg; Justice, Dr. Lisco; Navy, Admiral von Tirpitz; Treasury, Herr Wermuth; Posts, Herr Kraetke.

HISTORY

THE BUDGET QUESTION. The main question of the closing months of 1908 was the government's plan for raising the enormous sum of 500,000,000 marks demanded in the autumn of that year in the so-called "financial reform" programme. This included several new taxes which encountered serious opposition and the matter was referred to a Finance Reform Committee, which continued its discussion in 1909. It was unable to reduce materially the estimates and despite the opposition to the specific measures of the government, new taxation in some form was generally admitted to be unavoidable. The taxes on gas and electricity encountered such serious opposition that they seemed impracticable. The taxes on beers, wines, spirits and tobacco seemed a reasonable source of revenue, but these too encountered opposition. The Commercial Diet of Berlin on January 11 proposed a tax on beer and the tobacco retail trade and condemned the government's plan for a monopoly of spirits. The proposed succession tax caused special indignation among the Conservatives and Agrarians. When Chancellor von Billow presented his financial scheme in November, 1908, he had cited the authority of the well-known economist, Professor Wagner. This, however, carried little weight with the interested classes, and when Professor Wagner at a meeting of the Tax Reform League (Agrarian) condemned the selfish attitude of the propertied classes, declaring that a succession tax could not be avoided since no Imperial direct tax was practicable, it served only to increase exasperation. The situation of the government became embarrassing. By March 20, little was left of the government programme, the Committee having rejected the government proposals as to the monopoly of spirits, as to matriular contributions and as to death duties, and the taxation of newspaper advertisements, gas and electricity. On April 21, Chancellor von Billow warned the Reichstag that new taxation sufficient to provide 500,000,000 marks must be passed during the session. A new form of inheritance tax would be substituted, new taxes would replace those on gas and electricity, and the tax on railway tickets would be improved. From April 10 on, the Finance Reform Committee encountered serious difficulties in Parliament on account of the opposition of the Conservative-Centre to direct taxes. In place of the succession tax and any form of tax on

bequeathed estates the Conservatives proposed a tax on increased values. The National Liberal press opposed this plan and declared the *bloc* at an end, but the Conservatives professed to regard this as an empty threat. The government objected on the score of lack of time to the drafting of a tax on increased values, but the Conservatives hastily prepared such a measure, on the basis of increased values on lands, town sites, stocks and shares. The government declared a tax on bequeathed estates an essential part of its programme. The Conservatives and Centre were opposed. On May 1, the Finance Committee rejected all the direct tax proposals. On May 11 it agreed on a scheme for a tobacco tax which, however, would yield less than half of the amount that the government had declared essential. It rejected the government proposal for a tax on still wines and while it accepted a tax on sparkling wines the yield would be considerably less than the government had demanded. This was true also of the proposal as to spirits. Von Billow's proposed improvement in the railway ticket tax involved the taxation of fourth-class railway tickets and was vigorously opposed by the popular press. On May 28, Dr. Paasche, the chairman of the Committee, having been outvoted by the Conservatives, resigned, and thereupon the National Liberal and Radical members withdrew. A deadlock resulted and the Reichstag adjourned to June 15. The main question now was what measures should be taken to keep the *bloc* united. The course of the National Liberals and Radicals in refusing to take part in the discussions of the Finance Committee on May 28 was supported by the Socialists. The point at issue was the introduction into the discussion of proposals that had not been previously referred to the Reichstag. The Conservatives, Centre, Poles, and Anti-Semites were taking the place of the Conservative-Liberal *bloc*. The Conservatives were making proposal after proposal for indirect taxes in order to bar the way to the hated death duties. The scheme of taxation supported by the Committee included a tax on milling products, exports of coal, bonds and securities, higher duties on tea and coffee and a tax on matches. At the end of May there seemed little hope of restoring the shattered Conservative-Liberal *bloc*.

THE FAILURE OF THE CHANCELLOR'S POLICY.—After the apparent rupture of the *bloc* at the close of May, Chancellor von Billow seemed to recognize that the Conservatives had the upper hand, but nevertheless, he wished to placate the Liberals. The government's new tax proposals were published on June 14. The Chancellor warned the Conservatives against rejecting them, saying that the propertied classes ought to bear a large part of the new burdens. This was the opinion of the Federal Council as well as himself. He declared himself opposed to any taxes that would restrict or injure trade. But the power of the Conservative-Centre combination was manifest, not only in the Committee, but in the Reichstag. The latter passed the tax on securities proposed by the Conservatives and Centre, but a tax on coupons was afterwards substituted for it. On June 23, in spite of the government's warning, the Conservatives and Centre altered the proposed taxes. The Conservative-Centre proposal for an increment tax on town property was read for the second time in the Reichstag. At the end of

DR. THEOBALD VON BETHMANN-HOLLWEG
Chancellor of the German Empire

GERMANY

PRINCE BERNHARD VON BÜLOW
Retiring Chancellor

June the new government inheritance tax was rejected by a vote of 194 to 186 and the Committee's proposals for a stamp duty, increased duties on tea and coffee and the tax on real estate transfers were accepted. Another essential feature of the government's plan, the change of the financial relations between the empire and the states, was also rejected. The Finance Reform Committee, while accepting the government's penny stamp on checks, rejected its proposed tax on fire insurance and its penny stamp on bank credit receipts. Meanwhile Chancellor von Bülow had offered his resignation to the Kaiser. On July 2 the tobacco tax bill, levying an ad valorem tax of forty per cent. on all kinds of tobacco, was read the second time. This was accepted by the government. On July 6 the match tax bill was read the second time. The Conservatives and Centre had finally come to an agreement with the Federated States' government as to the policy to be pursued for raising the necessary amount. From the taxes on alcohol, tobacco, beer, matches, sparkling wines, tea and coffee, railway tickets, etc., the estimated returns were 400,000,000 marks; and from coupons, checks and timber duties, the sugar duty and the increase in the matricular contributions from 40 to 80 pf. per capita, 132,000,000 marks were expected. But the overthrow of von Bülow's policy was complete. On July 14 his resignation was accepted by the Kaiser. Dr. Theobald von Bethmann-Hollweg was immediately appointed his successor. In the public interview von Bülow condemned the Conservatives and declared that there was no difficulty between him and the Kaiser. On July 10 the new Chancellor announced in his capacity as Secretary of the Interior that the Federated governments, though not fully approving the new taxation scheme, would accept it. The finance bill, embodying the Conservative-Centre proposals, now passed its third reading in the Reichstag. On behalf of it a Conservative spokesman said that his party had made genuine sacrifices to meet the present difficulties and that the opposition to an inheritance tax arose from the feeling that it was a dangerous matter for a Reichstag chosen on the principle of equal suffrage to impose such a property tax, and that it might pave the way to expropriation. On July 13 the Reichstag was closed by Imperial decree. The downfall of von Bülow and the triumph of the Conservative-Centre policy marked the end of the era of *bloc* government. The new taxation laws were officially published on July 31.

POLITICAL PARTIES AND THE BUDGET. The following account of the relations of political parties and the downfall of the *bloc* is based on a critical review contributed by a German deputy in the Reichstag to the *Révue Politique*. The policy of the Conservative-Liberal *bloc* began after the elections of January, 1907. The foreign policy of Germany had caused distrust abroad and criticism at home, where its faults were set down to the personal rule of the Kaiser. The scandal of the so-called "camarilla," the belief that a group of corrupt courtiers secretly directed the personal régime and controlled the policy of the state, had irritated public opinion and inspired numerous articles and pamphlets toward the end of 1906 that were aimed against the Emperor. The object of the *bloc* policy was to allay this discontent by a recognition of the more democratic element

in the Reichstag. But the concessions to the Liberals were more apparent than real. It was only in appearance a constitutional government and the powers of Parliament were in no wise enlarged. The Clerical sentiment was as strong as ever. The Liberals acquired a taste of power, which they showed a willingness to make heavy sacrifices to retain. The interview in the *Daily Telegraph* in November, 1908, caused a storm of indignation against the system of personal rule and Imperial direction of the foreign policy. Chancellor von Bülow saw the necessity of making concessions. His defense of the Emperor in the course of the November agitation in the Reichstag was qualified and he drew from the Emperor a promise that he would thenceforth respect the limits that the constitution prescribed and work in harmony with the other agents of government. From that time on it was generally believed that the Emperor desired the Chancellor's downfall. Meanwhile the latter had offended the Conservatives by his course in the November affair, for they saw in it a first step toward limitation of Imperial power and toward parliamentary government, and also by his attitude toward the suffrage question in the Prussian Landtag, to which, in the speech from the throne, he had promised electoral reform. The Conservatives, moreover, were growing tired of the *bloc*, and feared that it would eventually result in too great concessions to the Liberals. They now began to rely for support on the Centre, who from the first had hated the *bloc* and desired the downfall of von Bülow, and who were naturally eager for an opportunity to replace the Conservative-Liberal by a Conservative-Centre combination. The contests occasioned by the financial proposals gave them their chance.

The Liberals were expected by some to take advantage of the situation to extort concessions from the government as the price of their support. The two chief features of their programme were the introduction of actual parliamentary government with the suppression of the personal régime, and the reform of the Prussian electoral system. These were popular aims, and the Liberals had the assurance that von Bülow was bound to carry through the financial measures only by the Conservative-Liberal majority and not by any other political combination. Many critics held that the best means of meeting the deficit was to reduce the enormous cost of armament, but neither the Conservatives nor the National Liberals were willing to consider that way out of the difficulty, the *bloc* having been elected on a nationalist platform. Though Chancellor von Bülow referred to the need of economies in military administration, he offered no definite plan of retrenchment. The Liberals seemed more concerned for the maintenance of the *bloc* than for the attainment of their political purposes. They showed themselves pliant and instead of demanding concessions, made them. They refused to insist on the Prussian electoral reform and they allowed the constitutional proposals offered after the November affair to be practically shelved in the committee. As to the financial programme of the government, they decided after some hesitation to support it, although it ran counter to their former principles. For they had hitherto contended that henceforth revenues should be raised chiefly by property taxes, especially

by a tax on capital and an Imperial income tax and that the taxation of articles of consumption, which bore heavily upon the people, should be correspondingly lightened. But the government plan would raise four-fifths of the 500,000,000 marks by indirect taxes (taxes on consumption) and only one-fifth by taxes on acquired wealth. The articles which the government proposed to tax were, with the exception of sparkling wines, articles of popular consumption, namely, alcohol, beer, tobacco and matches. The other taxes were of a kind to hamper industries, namely, the taxes on advertisements, gas, and electricity. The Liberals, however, justified their acceptance of these proposals, by pointing to the merits of the government's other proposal, that of the succession tax. They declared that this was indispensable and that they had made it the condition of their support. The succession tax was indeed a popular measure and not open to the objections that were offered to the others, and it was generally regarded by economists and by the more intelligent with favor. It was, however, violently opposed by the extreme Conservatives and by the Agrarians, who argued that it was a dangerous precedent for a Reichstag elected by popular majorities composed of persons without property, and might be the first step toward confiscation, that it violated the sentiment of family by the intrusion of the tax officers in the household after a decease to determine the amount of the succession, and that it was inequitable, as it bore more heavily on immovable property, especially land, than on capital and movables.

On this point, as well as in matters of general policy, the Conservative element in the Finance Reform Committee began to incline toward the Centre, apparently wishing to try the experiment of a combination which should supersede the *bloc*. The Conservatives rejected the succession tax and proposed a tax on acquired wealth to be levied by the states and then turned over to the Imperial government according to the needs. This was opposed by the Federated States as likely to plunge the state finances into confusion, and by the press as virtually shelving the succession tax. The government was suspected of disloyalty to the *bloc*, and to overcome this suspicion the Chancellor announced that he would not carry through the financial reforms with the aid of the Centre.

Contests between the Liberals and Conservatives in the Parliamentary Finance Commission soon developed over the details of the plan for indirect taxation. Though they were agreed on the general principle that 400,000,000 marks must be raised by these means they differed as to the proper articles for taxation, the Conservatives wishing to spare agriculture and throw the burden so far as possible on industry and trade, and the Liberals desiring the opposite. After months of discussion nothing was actually accomplished. The government's proposals were rejected or reduced to insignificance. The results were contradictory and confused, and the irritation between the parties in the *bloc* became intolerable. Such was the situation at the beginning of the Easter vacation. At this juncture the Centre came forward with a proposal in connection with the alcohol tax measure for a renewal of the exemption hitherto accorded to the farm distilleries. This won the Agrarian vote and was carried in the Finance

Commission by a large majority. From this time on the Centre pursued the policy of supporting the Agrarians with a view to substituting a Conservative-Centre combination for the Liberal-Conservative *bloc* and overthrowing the Chancellor. The Liberals and the Chancellor finally made efforts to prevent this, but too late. The Chancellor's compromise in the matter of the succession tax by imposing a tax on the portion of the estate that passed to each heir instead of the whole estate of the decedent was of no avail. The Liberals found themselves continually outvoted without the slightest regard to the interests of commerce and industry, which they championed. The president of the Commission, a National-Liberal, finally resigned (May 28), and all the members of the Left, including the Socialists, withdrew from the Commission. A large meeting of protest was held and a so-called "Hanseatic League" was formed to combat the aggressions of the Agrarians, but it was impossible to check the movement, and finally the succession tax was defeated in the Reichstag by a small majority in which the twenty Polish deputies, who joined the Clerical-Conservative alliance from hatred of von Böllow as the author of Polish expropriation, cast the decisive votes. Thereupon von Böllow offered his resignation. The new coalition pushed through its programme rapidly under the direction of von Bethmann-Hollweg, Minister of the Interior, who later succeeded to the Chancellorship. The tax programme as adopted was as follows:

Taxes on consumption:

	Marks
Alcohol	100,000,000
Beer	80,000,000
Tobacco	40,000,000
Matches	25,000,000
Lighting	45,000,000
Sparkling wines	40,000,000
Tea and coffee	45,000,000
Railway tickets	25,000,000

Taxes on acquired wealth (in place of the succession tax):

	Marks
Coupons	20,000,000
Checks	20,000,000
Timber duties	2,000,000
Matricular contributions	55,000,000
Sugar duty	85,000,000

The Reichstag was then adjourned and the new Chancellor von Bethmann-Hollweg assumed office, Herr von Sydow, former Minister of Finance, succeeding him as Minister of the Interior, and Herr Wermuth becoming Minister of Finance.

NAVAL DISCUSSION. The fear that Germany would accelerate her programme of naval construction occasioned great uneasiness in Great Britain, where every move was watched with anxiety and every rumor gravely discussed. (See GREAT BRITAIN, paragraphs on *History*.) In German official quarters the tendency of British writers to exaggerate German designs in the matter of naval development were frequently deprecated. A debate on naval estimates took place in the Reichstag on March 17. At that time Admiral von Tirpitz declared that

Germany would by 1912 have 13 *Dreadnoughts*, not 17 as British public men had stated. The government's policy of naval construction was supported by the Conservatives and National Liberals, while the Centre and Radicals demanded a reduced rate in the building programme. Reference was made on March 22 by the Imperial Foreign Secretary to the British government's wish for a mutual understanding as to the rate of naval construction, although, as he then declared, no proposal had been made. In general, he said, German naval construction was designed solely for German protection and involved no menace to any other nation. On March 23 the naval estimates were voted practically without debate, which marked a triumph of *bloc* politics contrasting with the failure to hold the *bloc* together on the government's finance reform programme. The army estimates were debated on March 22, and encountered as usual sharp criticism from the Socialists. On March 29 the Chancellor referred to the foreign policy of the government renewing the assurance of friendship with Great Britain and speaking of Germany's conciliatory attitude toward France and Morocco and her support, though without "excessive zeal," of Austria-Hungary in the Balkan crisis. The Chancellor said: "The Federal government entertains no thoughts of entering into competition with British sea powers by means of the construction of the German navy. . . . We desire to create our naval armaments solely for the protection of our coasts and our trade. . . . The programme of our naval construction lies open in absolute publicity. We have nothing to keep secret. . . . In the autumn of 1912, at the earliest, we shall have ready for service the 13 large new ships, including 3 armored cruisers, provided by law." He added that the attitude of the Federal government was based upon considerations of humanity and peace, in full accord with the peaceful tendency of the whole policy of Germany for many decades past. The thirteen large battleships which were expected to be ready in 1912 were to comprise ten *Dreadnoughts* and three *Invincibles*. In general it was evident that the government intended to adhere to a forward naval policy; but the rapidity of naval construction was repeatedly declared to be nothing like what the British press in its alarm was anticipating. Admiral von Tirpitz declared early in April that the time of construction had not been reduced, as was currently reported in Great Britain, to thirty or twenty-six months, but was still about thirty-six, and that forty months would be required in the Imperial yards, to say nothing of the time that would elapse during trial, but meanwhile rumors on the subject of Germany's designs continued to circulate freely in the press of both countries, and in England it was suspected that the rate of construction in Germany's shipyards was far more rapid than was publicly given out. The Navy League met at Kiel on June 5. Its policy was declared by the president and manager to be first of all an insistence on the strict fulfillment of the navy law and an increase, not only in ships, but in men.

OTHER QUESTIONS BEFORE THE REICHSTAG. An industrial amendment act was passed early in the year reducing the maximum number of hours for women per week from 65 to 58, and increasing by one hour the period within which

night work was forbidden. It prescribed 11 hours' rest after each day's work. The government's measure for the amendment and extension of workingmen's insurance legislation provided for a considerable extension of sick insurance, and the inclusion of all classes not previously comprised, namely, agricultural laborers working for a shorter time than a week, stage and orchestra employees, teachers not employed by the state, etc. Closely connected with the subject of finance reform was the question of the increase of the salaries of public officials. It was generally admitted that such increase was necessary, but the government made it conditional upon the adoption of its finance reform programme. Great discontent was manifested among certain classes of the public servants, as illustrated by the sharply critical speeches at a Congress of Functionaries which met at Berlin about Easter. It will be remembered that the various constitutional questions raised after the much-discussed interview with the Kaiser in the *Daily Telegraph*, involving especially the principle of ministerial responsibility, were referred toward the close of 1908 to a Commission of the Reichstag. No positive result was reached by this Commission, but, as was expected, it simply served the purpose of shelving an acrimonious discussion. Little importance was attached to it in Parliament and especially by the Liberal Party. The proposals which had been referred to it were for the most part either rejected or reduced to very insignificant proportions. The Commission adjourned several times. Its undefined political status rendered the value of any decisions it might reach very uncertain.

THE NEW SESSION. The new session began on November 30. The speech from the throne referred to the friendly relations with other Powers and announced that a bill would be brought in to extend for two years the law concerning trade relations with Great Britain. This bill was subsequently introduced and passed its third reading on December 7. On December 9 the new Chancellor made his first official appearance in the Reichstag. On the following day he discussed briefly Germany's foreign relations. Baron von Schoren, the Foreign Secretary, spoke on the same subject, referring especially to the cordial relations with France in Morocco, as evidenced by the recent action of France in preferring the claims of German creditors to her own. He also declared that the Belgian government's reform plans as to the Congo represented a fulfillment of treaty rights. The Minister of Finance in announcing the estimates declared the prospects for the coming year were better.

PRUSSIA. According to Baron von Rheinbaben's estimate the Prussian deficit for 1909 was about \$39,000,000. He laid this before the lower house of the Landtag on January 12, which was called upon to sanction a loan. The Conservative element in the Prussian legislature was bitterly opposed to the Imperial financial policy and to the Chancellor's approaches to the Radical element in the Reichstag. They held the same view as to death duties that the Imperial Conservative party held, namely, that they were grossly unfair. On January 25, a debate occurred on the franchise, but the government refused to discuss the subject till certain statistical investigations, which were then going on, should be completed. On

January 26, a motion for substituting direct for indirect elections was rejected by a vote of 168 against 165, its opponents declaring that they were not against all change but merely against the programme of reform as outlined by the unrepresented classes. Demonstrations on behalf of franchise reform were made by the Socialists soon afterwards, and collisions with the police occurred at Cologne, Breslau, Kiel and Hanover. At the last-named place a score of persons were wounded. Early in February the Socialists incited some demonstrations on the part of the unemployed which led to disturbances on February 9, in the course of which the crowds pulled down the flags from the omnibuses and buildings and several persons were arrested. In Prussian as well as in Imperial politics the two chief practical questions during the first part of the year were the need of increased permanent receipts and of increased salaries for officials. The financial measures in Prussia included an increased tax on incomes on the principle of slow progression from incomes of 1200 marks. As to salaries, it was necessary for Prussia to await the action of the Imperial government since the salaries of Prussian officials had to be on the same scale as those of Imperial officials.

The government's proceedings against Dr. Lothar Schücking, mayor of Hasum, begun in 1908, terminated successfully. The case aroused much sympathy with Dr. Schücking among the Liberals as a victim of the government's reactionary policy. Disciplinary proceedings were instituted against him for attacking in a book and in published articles certain alleged abuses incident to the influence in the state of the military and noble caste, the bureaucrats and the wealthy student bodies. Nothing was urged against him either as Mayor or as a private person and the success of the government was regarded by the Liberal and Independent press and even by some Conservatives as a blow at the freedom of political criticism. He was disciplined, they said, for a simple declaration of opinions displeasing to the authorities.

OTHER EVENTS. The new postal arrangement between Germany and the United States for the rate of two cents an ounce on letters went into effect January 1. The fiftieth birthday of the Kaiser was celebrated on January 27. On February 9, the King and Queen of Great Britain visited Berlin and were received with the utmost cordiality. The visit was intended to promote good feelings between the two nations and was believed to have contributed to this end. Toward the end of the month Germany and the United States agreed on a treaty protecting the patent rights of their citizens. The Congress on the treatment of juvenile offenders was opened at Charlottenburg on March 15. The number of juvenile courts in Prussia was at that time 26. It was reported that the number of juvenile offenders had increased three times as fast as that of other offenders. The Emperor and Empress visited Italy in May, meeting the King and Queen of Italy at Brindisi on May 12. The Berne Copyright Convention was accepted by Germany, which was the first nation to sign the agreement. In May the Kaiser visited Vienna and this was the occasion for mutual congratulations on the Triple Alliance and much praise of what Germany had recently done to maintain the European peace.

The twentieth session of the International Congress of Miners was held at Berlin from May 31 to June 4. It adopted resolutions condemning piece work, and advocating the minimum wage and annual vacations in all countries, declaring that the production of coal ought not to exceed the demand except for a one per cent. reserve, urging the nationalization of mines (although the German and Austrian delegates said that the men were no better treated in the state-owned mines); demanding immediate legislation for better precautions for safety in the mines and for the election by the workingmen of inspectors from among the employed, to be paid by the state; and urging that when a general strike was declared in one country the miners' organization in neighboring countries should limit production by ceasing work for a time. In the course of a speech made at the Congress it was said that in fifteen years the trade unions of Germany had increased from 300,000 to 1,800,000. Early in June delegates from the British churches, accepting the invitation of the joint commission of German churches, began a series of visits to German cities where they received a cordial welcome. Much was said about the visit as tending to promote friendly relations between the two nations. The University of Leipzig celebrated its five hundredth anniversary on July 30. The Eucharistic Congress was opened at Cologne on August 4. The International Maritime Conference Committee met at Bremen at the end of September. The naval manœuvres under the Admiral, Prince Henry, were appointed to take place early in September. The Emperor and Empress visited the Netherlands early in August. An international visit which caused much comment in the press was that of the Imperial Chancellor to Vienna in September. He held an interview with the Emperor in the course of which the importance of the Austro-German alliance was emphasized and the complete accord between the Chancellors of the two countries. The Eucharistic Conference at Cologne ended on August 8. For an account of the Socialist Conference, see SOCIALISM. On January 22, the Foreign Secretary declared that Germany regarded the Belgian annexation of the Congo as an accomplished fact and he announced his belief that under the new régime the evils complained of would be removed. The sentence in the famous Harden Case was rendered in April. A fine of \$150 was imposed upon him for libeling Count von Moltke. Representatives of the British Labor Party visited Germany in June and were received by one of the vice-presidents of the Reichstag on June 6. In the autumn the revised figures for the deficit for the financial year 1908 showed considerable increase beyond the original estimates, which increase would have to be met out of the proposed loan. One effect of the new tobacco duty was the laying off of a large number of workingmen at Hamburg and other centres, which led to a petition from the workingmen's association for the distribution of the special fund provided for in the Budget to relieve unemployment resulting from this cause. Another effect of the new duties was the increase of coffee and tobacco smuggling from the Netherlands, necessitating the establishment of a large number of new custom houses. See WOMEN IN INDUSTRY.

SOCIALIST SUCCESSES. The feeling of the people toward the new taxes was shown by Socialist gains. The Socialists won in three

supplementary elections to the Reichstag (Coburg, Kaiserslautern, and Halle), and scored substantial gains in other districts. But their success in the October elections to the Diets of Saxony and Baden was especially noteworthy. In the former kingdom a reactionary system has prevailed, resulting in their virtual exclusion, but in 1909 a measure of electoral reform based on plural voting went into effect. It was thought that under the system of plural voting, it would still be possible to exclude the Socialists. But in the first elections held under it in October the reactionary party was overwhelmed, the conservative party was reduced to a powerless minority, and the Socialists acquired nearly one-third of the seats. In Baden the Socialists secured on the first ballot a larger number of seats than they had ever had before. On the second ballot the Liberals, National Liberals, Democrats and Socialists united and secured nearly two-thirds of the seats. See ARBITRATION, INTERNATIONAL; FINANCIAL REVIEW, SOCIALISM, TARIFF and TRADE UNIONS.

GERONIMO. An Indian chief of the Chiricahua Apache tribe, died February 17, 1909. There is no accurate record of the date of his birth, but his career as a "hostile" Indian began in the early '60's. He was the son of Magnus Colorado, chief of the Warm Spring Chiricahuas, a terror to the settlers in Arizona and New Mexico. On the death of Cochise, the war chief of the Chiricahua Apaches in 1875, Geronimo was chosen to succeed him. The career of Cochise for plunder and rapine was exceeded only by that of Geronimo. In the next ten years the latter killed men, women and children in numbers that can never be known. His cruelty to those whom he captured is almost beyond belief. In 1885 General Crook, who had been pursuing the marauding Apaches for many months, had succeeded in confining all except Geronimo's band to the reservations. He finally succeeded in cornering the latter, but, owing to the carelessness of those guarding the trails, the wily Indian escaped and fled into Mexico. For this General Crook was removed from command, and General Miles took up the chase. In August, 1886, Captain (afterwards General) H. W. Lawton succeeded in penning Geronimo and his band at the junction of the San Bernardino and Bavispe rivers on the Mexican border. After some parleying Geronimo surrendered unconditionally. He was sent to Fort Pickens, Fla., but the climate proved unhealthy for him, and he was taken to Fort Sill, Okla., where he passed the remainder of his days. Geronimo was one of the cruelest and subtlest Indians with whom the government ever had to deal. Although he professed several years before he died to have been "converted," and had joined the Dutch Reformed Church, he was constantly on the lookout to slip away and stir up trouble. He remained "unreconstructed" to the last.

GIBRALTAR. A British Crown colony and naval fortress on the southern coast of Spain. The port is free and is the mart of a considerable trade between Great Britain and northern Africa; it is also an important coaling station. Its area is 17 square miles; estimated civil population, mostly descendants of Genoese settlers, (1907) 18,644; (1908), 18,316. Military (1907) 5007. There are government and private schools; the inhabitants are for the most part Roman Catholics. There are

practically no industries. There are four miles of telegraph line (3 military), and external cable communications. The revenue and expenditures in 1907 were £83,804 and £71,670 respectively. The expenditure (military) by the British government amounted (1907) to £325,152. The colony is administered by a military governor—in 1909, General Sir F. W. E. Forester-Walker.

GIFTS AND BEQUESTS. The amounts given for gifts and bequests in 1909 greatly exceeded the total of similar gifts in 1908 and very nearly approached the great sum of over \$150,000,000 given in 1907. According to the records compiled by the *Chicago Tribune*, from which the list below is taken, the amount donated for all purposes was \$147,641,253 as compared with \$90,032,090 in 1908. Of the gifts and bequests in 1909 \$70,636,387 represents gifts and \$77,004,866 bequests. The whole amount is distributed as follows: Charity, \$67,466,421; educational institutions, \$46,122,241; religious institutions, \$22,443,885; art museums, galleries and public improvements, \$8,616,410; and libraries, \$3,012,293. The largest individual giver in 1909 was John D. Rockefeller. His total gifts for the year amounted to \$12,130,500. Of this sum, \$10,000,000 represented an additional gift to the General Board of Education (see UNIVERSITIES AND COLLEGES). He gave \$1,000,000 to the University of Chicago, and \$1,000,000 for the investigation of hookworm disease (q. v.), Mr. Andrew Carnegie in 1909 took second place as a dispenser of gifts. They aggregated \$4,652,500. The largest gift made by Mr. Carnegie was one of \$2,000,000 to the Pittsburg School of Applied Science. He gave \$1,000,000 for the founding of the French Hero Fund and several of his other gifts equaled or exceeded \$100,000. Mrs. Russell Sage gave away during the year a total of \$1,201,761. The largest of these was the conditional gift to the Methodist Church for Bible extension. For this purpose she gave \$500,000. She gave to Princeton University \$250,000 and to the Metropolitan Museum of Art \$225,000. Among the donors to colleges, Dr. D. K. Pearson of Chicago is notable. His gifts aggregated \$541,000. He gave considerable sums also to various other institutions. The total benefactions of these four persons during a number of years is as follows: Mr. Carnegie, \$162,000,000; Mr. Rockafeller, \$131,760,062; Mrs. Sage, about \$26,000,000; Dr. Pearson, about \$3,000,000. Among the most generous donations to colleges and other institutions and causes in recent years were those left by Mr. John Stewart Kennedy (q. v.). These gifts aggregated more than \$12,000,000.

The following list includes gifts which amount in value to \$5000 or over.

Adelbert College, gift by various donors, \$375,-000.

Adids, Thomas E., New Haven, Conn., will to charity, \$350,000.

African Diamond Jubilee, \$280,000.

Albany (Oregon) College, gift by various donors, \$25,000.

Alma College, gift by Andrew Carnegie, \$25,-000.

Alms, Mrs. F. F., Cincinnati, O., gift to Lincoln Home Association, \$100,000.

American Academy, Rome, gift by Mrs. Alexander Heyland, \$500,000; conditional bequest by Charles F. McKim, \$1,000,000; gift by John D. Rockefeller, \$100,000.

- American Girls School, Constantinople, gift by Helen Gould, \$100,000.
- American Library Association, gift by Andrew Carnegie, \$100,000.
- American Museum of Natural History, gift by Phoebe A. Thomas, \$5000.
- American University, gift by unnamed donor, \$11,000.
- Ampt, W. M., Cincinnati, Ohio, gift for popular music, \$150,000.
- Anderson, Elizabeth M., New York, gift to Children's Aid Society, \$300,000.
- Archbold, J. D., New York, gift to Syracuse University, \$375,000.
- Armour Institute, gift by J. Ogden Armour, \$1,323,500.
- Arnold, Gabelle, Pittsburg, Pa., gift to church, \$170,000; gift to charity, \$30,000.
- Art Institute, Chicago, Ill., gift by various donors, \$100,000.
- Art Institute, N. Y., gift by A. A. Healy, \$20,000.
- Atwater, Grace E., New York, gift to charity, \$10,000.
- Atwood, I. S., N. Y., gift to Hebron Academy, \$10,000.
- Augustana College, gift by Donckmann Estate, \$100,000; gift of library by P. C. A. Denkman and family, \$100,000.
- Ayer, Frederick F., New York, gift to charity, \$50,000.
- Ballarin, Bartolo, Los Angeles, Cal., gift to charity, \$25,000.
- Baptist Church, missions, \$3,000,000.
- Barstow, Mr. and Mrs. W. A., Orange, N. J., gift to charity, \$200,000.
- Bartold, George, Monterey, Cal., will to city, \$10,000.
- Battle Creek Sanitarium, gift by Charles E. Wood, \$1,000,000.
- Beach, Helen A., Oshkosh, Wis., gift to Manual Training School, \$5000.
- Beckman, W. H., Cincinnati, O., gift to charity, \$5000.
- Belden, Clara, Kenosha, Wis., gift to church, \$15,000.
- Belmont, August, New York, gift to Railway Employees' Clubhouse, \$10,000.
- Bennett, C. U., Coldwater, Mich., gift to library, \$5000.
- Berea College, gift by Francis Clarke, \$5000; gift by D. K. Pearsons, Chicago, \$25,000.
- Berwynd, John E., New York, gift to charity, \$100,000.
- Bethany College, gift by George T. Oliver, \$25,000.
- Bethea, S. H., Dixon, Ill., willed to charity, \$100,000.
- Blackburn College, gift by Harris Estate, \$20,000; by Andrew Carnegie, \$10,000.
- Blaine, Anita McCormick, Chicago, Ill., gift to public school playground, \$38,610.
- Blake, Susan P., Brookline, Mass., gift to charity, \$18,000.
- Blodgett, Miss E. B., Exeter, N. H., gift to library, \$10,000.
- Boehne, J. W., Evansville, Ind., gift to charity, \$5000.
- Boston, Mass., Art Museum, gift by various donors, \$150,000.
- Bowdoin College, gift by Joseph E. Merrill, Newton, Mass., \$300,000; gift by Mrs. A. S. Flagg, \$25,000.
- Boya, S. S., Alexandria, La., gift to library, \$10,000.
- Boyle, Catharine, Philadelphia, gift to charity, \$11,000; gift to church, \$11,000.
- Boys' Club, Springfield, Mass., gift by various donors, \$100,000.
- Bookstaver, H. W., gift to Rutgers College, \$17,500.
- Bray, W. M., Oshkosh, Wis., gift to city for park, \$15,000.
- Brigham Hospital, gift by Elizabeth Brigham, \$2,500,000.
- Brown, George W., St. Louis, Mo., gift to church, \$15,000.
- Brown, John G., Providence, R. I., will to charity, \$150,000.
- Brown University, gifts by Francis A. Gaskill, Worcester, \$10,000; Helen W. Miller, \$20,000; John D. Rockefeller, Jr., \$25,000; Mrs. W. H. Miller, Providence, R. I., \$20,000.
- Browne, Catharine, Schwenkville, Pa., gift to church, \$5000.
- Bryant, Mary M., Philadelphia, Pa., gift to charity, \$5000.
- Bryn Mawr College, gift by Cynthia M. Watson, \$7000.
- Buechel, Augusta, Germantown, Pa., gift to charity, \$10,500.
- Burgess, Annie P., New York, gift to St. Luke's Hospital, \$5000; for college scholarships, \$10,000.
- Burke, John M., New York, gift to found convalescent home, \$4,000,000.
- Burnett, J. A., McAlester, Okla., gift to church, \$1,000,000.
- Busch, Adolphus, St. Louis, Mo., gifts to Harvard University, \$50,000; to Italian Earthquake Fund, \$25,000; Harvard University, \$200,000; Germanic Museum, \$50,000.
- Butler, Virginia, Stockbridge, Mass., gift to church, \$30,000.
- Butterick, Catharine, Lowell, Mass., gift to charity, \$48,500.
- Calhoun Colored School, gift by Caroline Phelps Stokes, \$10,000.
- Camp, Caleb J., Winsted, Conn., gift to charity, \$25,000.
- Canandaigua, N. Y., gift of post-office site by Mrs. F. F. Thompson, \$20,000.
- Carleton College, gift by Mr. and Mrs. F. B. Northfield, \$35,000.
- Carleton, Murray, St. Louis, Mo., gift to church, \$5000.
- Carnegie, Andrew, gifts to charity, \$5000; to University of Tennessee, \$40,000; American Library Association, \$100,000; 450 acres to Pennsylvania Institute for Civic Federation, \$100,000; Denver University, \$50,000; Christian College, \$25,000; to library, Tralee, Ireland, \$15,000; land to Pennsylvania for hospital; McGill University, \$100,000; to Alma College, \$25,000; Italian Earthquake Fund, \$10,000; Koch Institute, Berlin, \$125,000; Blackburn College, \$10,000; branch libraries to Indianapolis, Ind., \$120,000; New York betterment, \$20,000; School of Applied Science, Pittsburgh, Pa., \$2,000,000; Wilkesbarre University, \$175,000; Hamilton College, \$200,000; University of Virginia, \$500,000; Ewing College, \$10,000; French Hero Fund, \$1,000,000; library to El Centro, Cal., \$10,000; Manassas School for Negroes, \$15,000; Cincinnati public library, \$100,000; library to Escondido, Cal., \$7500; Central American Peace Conference, \$25,000; Macalester College, \$20,000.
- Carpenter, H. W., gift to Columbia University, \$100,000.

- Carpenter, W. S., gift of schoolhouse to Nat-
chez, Miss., \$80,000.
- Carroll College, gift by J. A. Whitewater,
\$7000.
- Carthage College, gift by various donors, \$200,-
000.
- Cate, Della E., Marlboro, Mass., gift to Straf-
ford, N. H., Academy, \$200,000.
- Catholic Education, gift by James J. Hill,
\$10,000.
- Central American Peace Conference, gift by
Andrew Carnegie, \$25,000.
- Chaney, Cassius, Wellsville, Ohio, gift to
charity, \$10,000.
- Chappaqua, N. Y., gift to sanitarium by un-
named donor, \$300,000.
- Chautauqua (for colored race), gift by various
donors, \$20,000.
- Cherry mine relief fund, gift by various
donors, Chicago, Ill., \$125,000.
- Chicago, Ill., gift by various donors for tuber-
culosis sanitarium in New Mexico, \$50,000.
- Chicago Hebrew Institute, gift by Julius
Rosenwald, \$25,000.
- Chicago Theological Seminary, gift by D. K.
Parsons, \$125,000.
- Children's Aid Society, gift by Elizabeth M.
Anderson, New York, \$300,000; gift by unnamed
donor, \$424,000.
- Christian College, gift by R. H. Stockton, \$25,-
000; Andrew Carnegie, \$25,000; gift by un-
named donors, \$50,000.
- Cincinnati, Ohio, gift to charity by various
donors, \$20,000.
- Cincinnati Hebrew Union College, gift by
Julius Rosenwald, \$50,000.
- Clapp, Edwin, Weymouth, Mass., gift to
Memorial Association, \$70,000.
- Clapp, Lucius, Randolph, Mass., will to
charity, \$5000.
- Clark, Benjamin C., Cohasset, Mass., gift to
charity, \$10,000.
- Clark, Della O., White Plains, N. Y., gift to
charity, \$5000.
- Clark, John E., Paterson, N. J., gift to charity,
\$6000.
- Clarke, Francis, Philadelphia, Pa., gift to
Tuskegee Institute, \$5000; Berea College, \$5000;
charity, \$5000.
- Clough, Henry, Pittsburg, Pa., gift to Shaker
Community, \$50,000.
- Cochran, Eva S., Yonkers, N. Y., gift to fac-
tory workmen, \$350,000.
- Colburn, L. L., Chicago, Ill., gift to Columbia
University, \$5000.
- Colby Academy, gift by Sherman L. Whipple,
\$130,000; Susan C. Colgate, \$60,000.
- Colgate, Susan C., Boston, Mass., gift to Colby
Academy, \$60,000.
- Colgate University, gift by Elizabeth A. Hill,
\$25,000.
- College of the City of New York, gift by Henry
S. Treman, \$5000.
- Colorado Springs, Colo., gift of park by Per-
kins heirs, \$200,000.
- Colt, Samuel P., gift of high school building
to Bristol, R. I., \$200,000.
- Colton, F. B., Brookline, Mass., gift for col-
lege for girls, \$1,000,000.
- Columbia University, gift by H. W. Carpenter,
\$100,000; unnamed donor, \$100,000; various
donors, \$7500; Mrs. Marcella Jenkins, \$100,000;
L. L. Colburn, \$5000.
- Cortland, N. Y. (Hospital), gift by Charles
F. Wickwise, \$70,000.
- Cowper, Mrs. P. J., St. Louis, Mo., gift to
Drury College, \$25,000; gift to church, \$20,400;
gift to charity, \$5000.
- Crittenton, Charles N., New York, gift to
Crittenton Mission, \$2,000,000.
- Crocker, George, New York, gift for investi-
gating cancer, \$1,500,000.
- Crosby, Stephen, Boston, Mass., gift to Dart-
mouth College, \$50,000; gift to charity, \$8200.
- Cruze, Thomas, Helena, Mont., gift to church,
\$28,000.
- Cummings, Emma D., gift to charity, \$75,-
000; gift to Dartmouth College, \$25,000.
- Cutter, Bloodgood, New York, gift to Man-
hattan Bible Society, \$655,000.
- Cuyler, Cornelius C., New York, will to
Princeton University, \$100,000.
- Daggett, Alonzo B., Syracuse, N. Y., will to
charity, \$101,000.
- Daniels, Mr. and Mrs. J. W., Minneapolis,
Minn., gift to Yale University, \$50,000.
- Dartmouth College, gift by Stephen Crosby,
\$50,000; gift by Emma Cummings, \$25,000.
- Davis, Henry G., Wheeling, W. Va., gift to
Oddfellows' Home, \$150,000.
- Day, Livia H., New Haven, Conn., gift to Yale
Divinity School, \$15,000.
- Dayton, Julia G., Philadelphia, Pa., gift to
University of Pennsylvania, \$7000; gift to
charity, \$20,000.
- Deaconess Endowment Fund, gift by N. W.
Harris, Chicago, \$100,000.
- Decatur College, gift by James Milliken, \$400,-
000.
- Deering, Wm., Chicago, Ill., gift to Wesley
Hospital, \$55,000.
- Denkman, P. C. A. and family, Rock Island,
Ill., gift of library to Augustana College, \$100,-
000.
- Denver, Col. (Hospital), gift by various
donors, \$85,000.
- Derby, H. C., Watertown, Mass., gift to
schools, \$40,000.
- Des Moines, Ia. (unnamed donor), gift to
charity, \$40,000.
- Dixon, Arthur, Chicago, Ill., gift to charity,
\$7000.
- Dodge, Cleveland, New York, gift to Prince-
ton University, \$100,000.
- Dodge, Mary H., New York, gift to Shakes-
peare Memorial Theatre, \$350,000.
- Dominick, George F., New York, gift to
church, \$39,000.
- Donaldson, Mrs., Baltimore, Md., gift to Graft-
on Hall, \$50,000.
- Donckmann Estate, gift to Augustana College,
\$100,000.
- Dow, Mary M., Laconia, N. H., gift to church,
\$6300.
- Dows, Margaret, N. Y., gift to charity, \$45,-
000.
- Drafts, Mrs. K. E., Lexington, S. C., gift to
Mount Pleasant Seminary, \$6000.
- Draper, C. H., Brookline, Mass., gift to
charity, \$10,000; church, \$10,000, library,
\$5000.
- Drexel, Mrs. Franklin, Philadelphia, Pa., gift
to church, \$25,000.
- Duke family, Durham, N. C., gift to Trinity
College, \$5,250,000.
- Dunphy, Patrick, Pueblo, Colo., gift to church,
\$100,000.
- Durand, Henry C., estate of, Lake Forest, Ill.,
gift to church, \$10,000; gift to charity, \$40,-
000; gift to Lake Forest University, \$10,000.

- Earlham College, gift by M. M. White, \$10,000.
Eastman, George, gift to hospital, Rochester, N. Y., \$400,000.
- Eberhard, E. G., Mishawaka, Ind., gift to Y. M. C. A., \$7500.
- Eddy, Mary Baker G., gift to New York Museum of Sanitation and Safety, \$5000.
- Ehrmann, Ernest, New York, gift to charity, \$25,000.
- Ellis, Charles E., Philadelphia, Pa., gift to Home for Fatherless Girls, \$2,500,000; gift to schools, \$20,000.
- Ellmaker, Cecilia H., Lancaster, Pa., gift to charity, \$5000.
- Ely, S. Mills, Binghamton, N. Y., gift to Haverford Normal School, \$15,000; gift to Auburn Theological Seminary, \$5000.
- Emerson, Ellen T., Concord, Mass., gift to charity, \$11,000.
- Emery, George D., Boston, Mass., gift to Home for Friendless Women, \$10,000.
- Emery, Mrs. T. J., Cincinnati, O., gift to Hobart University, \$25,000.
- Evanston, Ill. (unnamed donor), gift to hospital, \$45,000; gift of park land by J. C. Patten, C. G. Davies and W. A. Vawter, \$41,000.
- Evanston Hospital, gift by James A. Patten, \$40,000.
- Ewing College, gift by Andrew Carnegie, \$10,000.
- Fairhaven, Mass., School of, gift by Henry H. Rogers, \$100,000.
- Falk, Emma, New York, gift to charity, \$10,000.
- Farley, Annie, Philadelphia, Pa., gift to charity, \$9000.
- Farnam, C. H., New Haven, Conn., gift to Yale University, \$500,000.
- Fay, Bridget, Chelsea, Mass., gift to charity, \$40,000.
- Feiler, Stella J., Harris County, Texas, gift to charity, \$500,000.
- Fellowes, Richard H., New Haven, Conn., gift to Yale University, \$50,000.
- Ferguson, William J., Philadelphia, Pa., gift to church, \$50,000.
- Ferson, Caroline N., Columbus, O., gift to church, \$70,000.
- Fetter, George, Philadelphia, Pa., gift to charity, \$50,000.
- Fifth Avenue Presbyterian Church, N. Y., gift by unnamed donor, \$25,000; gift by various donors, \$40,000.
- Filer, Mrs. D. W., Manistee, Mich., gift to charity, \$150,000.
- Fitz, John, Bethlehem, Pa., gift to Lehigh University, \$50,000.
- Flagg, Mrs. A. S., Springfield, Mass., gift to Bowdoin College, \$25,000; gift to charity, \$20,000.
- Flower, A. R., Watertown, N. Y., gift to charity, \$12,750.
- Ford, Henry, Detroit, Mich., gift for Boys Home, \$10,000.
- Foreign Missions, gift by various New York donors, \$63,749.
- Foss, Mrs. L. W., Seattle, Wash., gift to charity, \$40,000.
- Fowler, Helen B., Newburyport, Mass., gift to church, \$21,000; gift to charity, \$25,000; gift to the city, \$10,000.
- Fowler, Isabel M., Jamaica Plains, Mass., gift to charity, \$15,000.
- Fox, Reuben L., Oneonta, N. Y., gift to charity, \$30,000.
- Freeman, W. McLean, Philadelphia, Pa., gift to church, \$100,000.
- French Hero Fund, gift by Andrew Carnegie, \$1,000,000.
- Freund, Max, N. Y., gift to charity, \$7000.

Sears, Oak Park, Ill., \$10,000; Paterson, N. J., various donors, \$26,000; Pawtucket, R. I., various donors, \$50,000; Pittsburgh, Pa., George M. Laughlin, \$25,000; Franklin Russell, \$50,000; gift by William W. Smith, Poughkeepsie, N. Y., \$265,000; Pueblo, Col., various donors, \$111,460; Tampa, Fla., various donors, \$83,000; Topeka, Kan., various donors, \$50,616.
- Y. W. C. A., Milwaukee, Elizabeth Planking-ton, \$100,000.

GILDER, RICHARD WATSON. An American editor and poet, died November 18, 1909. He was born at Bordentown, N. J., February 8, 1844, the son of the Rev. W. H. Gilder, a Methodist Episcopal clergyman. While the boy was yet very young the parents removed to Flushing, L. I., where his father established a seminary. He early showed a leaning towards letters, and before his twelfth year he had issued a newspaper, called the *St. Thomas Register*, at Flushing. For this paper he set the type and performed all the other necessary labor. Four years later he was joined by four other youths in the publication of a campaign journal which advocated the cause of Bell and Everett in the Presidential campaign. This paper was ardently anti-slavery. His health was so delicate that he was educated at home by his father and at the seminary, of which the latter was the head. In spite of the frailty of his physique he enlisted in 1863 in Landis's Philadelphia Battery, and served until Lee was beaten back from Pennsylvania. He was under fire at the defense of Carlisle. His father was chaplain of the Fortieth New York Regiment and died while ministering to soldiers in the Army Smallpox Hospital. Young Gilder had studied law, but upon the death of his father in 1864 he was obliged to earn his own living and took a position as paymaster of the Camden and Amboy Railroad. Early in 1865 he became a reporter for the Newark, N. J., *Advertiser*. In turn he became political writer, city editor and managing editor. After several years he, with Newton Crane, then Consul at Manchester, England, founded the *Newark Register*. This was not successful, and in 1870 he became editor of *Hours at Home*, a monthly magazine, published by Scribners. His literary work had already given him a reputation. In the same year *Scribner's Monthly Magazine* was established under the editorship of Dr. J. G. Holland and the latter gave Mr. Gilder the position of managing editor. He wrote for the magazine "The Old Cabinet" department, which became one of its most attractive features. On the death of Dr. Holland, Mr. Gilder was made editor-in-chief and obtained a share in the publication. The magazine was shortly afterwards sold and reorganized, and its name was changed to *The Century*, and Mr. Gilder became, in 1881, its editor, and held this position until the time of his death. Although his inclinations were toward literary and scholarly life, Mr. Gilder took an active interest in politics and social problems. He was an independent Democrat and a close and intimate friend of Grover Cleveland. In 1903 he was nominated

to run for alderman in the Fifth District of New York City by the Citizens' Union. In 1894 he was appointed by Governor Flower a member of the Tenement House Commission, of which he was chairman. His work as a member of this commission won him wide recognition, and it was largely due to his efforts that radical changes were made in the building of tenements in New York City. During all the period of his editorial work Mr. Gilder wrote from time to time verse, which was widely read and appreciated. His first book of poems, *The New Day*, was published in 1875. This was followed in 1891 by *Tico Worlds, and Other Poems*, and between 1893 and 1898 four other volumes, *The Great Remembrance and Other Poems*, *Five Books of Song, For the Country*, and *In Palestine and Other Poems*. Other volumes of poems were entitled *The Celestial Passion, A Christmas Wreath, The Fire Divine*, and *In Helena's Garden*. A complete edition of his poetical works was published in 1909. He received the degree of L. H. D. from Princeton and Yale, and LL. D. from Dickinson and Wesleyan. In 1874 he married Helena de Kay, the daughter of Commodore George de Kay and granddaughter of Joseph Rodman Drake.

GILLESPIE, GEORGE DE NORMANDIE. An American Protestant Episcopal bishop, died March 19, 1909. He was born at Goshen, N. Y., in 1819, and graduated from the General Theological Seminary in 1840. He held pastorates in Leroy, N. Y., Crescent, O., Palmyra, N. Y., and Ann Arbor, Mich. until 1875, when he was made Bishop of Western Michigan. From 1876 until his death he was chairman of the Michigan State Board of Corrections and Charities. Among his writings are *The Communion of Saints, An Holy Priesthood*, and *The Season of Lent*.

GILMAN, ARTHUR. An American educator and author, died December 28, 1909. He was born in 1837 at Alton, Ill., and was educated in St. Louis and New York. From 1857 to 1862 he was engaged in the banking business in New York City and in the latter year was obliged to retire from business on account of ill health. He removed to Cambridge, Mass., in 1870. In 1877 he established the society for the collegiate instruction of women, which was known as the Harvard Annex, and later became Radcliffe College. He was a voluminous writer on historical and other subjects. Among his published works are: *First Steps in English Literature* (1870); *Kings, Queens and Barbarians* (1871); *The Story of Rome* (1886); *The Story of the Saracens* (1887); *The Discovery and Exploration of America* (1887); *The Colonization of America* (1887); and *The Making of the American Nation* (1887). He also edited the works of Chaucer (1879); *The Library of Religious Poetry* (1887) and Dryden's *Palamon and Arcite* (1898). He also collaborated in many other historical writings. He was a frequent contributor to the *Atlantic* and other periodicals, and was the founder of the Gilman School.

GOLD. The mining of gold in the United States progressed, on the whole, satisfactorily

in 1909. There was a marked recovery from the depressed conditions of the two years immediately preceding and the general advance resulted in the development of proved mines and districts. Although these improvements resulted in a generally increased production of the base metals and as a consequence, augmented the gold output, they did not detract seriously from those gold mining operations which had benefited during the late panic by the closing of numerous copper, lead and zinc mines and the consequent release of skilled labor for gold mining. The tables below show the gold production of the United States by States for the year 1908-9. The figures for 1909 are from the preliminary estimates of the Director of the Mint:

**PRODUCT OF GOLD IN THE UNITED STATES,
1908 AND 1909.**

State or Territory	Quantity	Value
Alabama	1,993	\$ 41,200
Alaska	960,669	19,858,800
Arizona	120,937	2,500,000
California	935,074	19,329,700
Colorado	1,106,385	22,871,000
Georgia	2,719	56,200
Idaho	69,829	1,443,500
Illinois	
Michigan	
Missouri	
Montana	152,865	3,160,000
Nevada	565,475	11,689,400
New Hampshire	179	3,700
New Mexico	14,817	306,300
North Carolina	4,716	97,500
Oregon	43,823	905,900
Philippine Islands	13,763	284,500
Porto Rico	29	600
South Carolina	2,598	53,700
South Dakota	374,529	7,742,200
Tennessee	179	3,700
Texas	24	500
Utah	190,922	3,946,700
Virginia	174	3,600
Washington	12,273	253,700
Wyoming	368	7,600
Total	4,574,340	\$94,560,000

State or Territory	Quantity	Value
Alabama	1,355	\$ 28,000
Alaska	1,013,340	20,947,600
Arizona	129,273	2,672,300
California	1,029,000	21,271,300
Colorado	1,062,056	21,954,700
Georgia	2,141	44,300
Idaho	67,207	1,389,300
Illinois	14	300
Michigan	
Missouri	9	200
Montana	174,183	3,599,400
Nevada	721,195	15,908,400
New Mexico	13,464	278,300
North Carolina	1,557	32,200
Oregon	34,488	712,900
Philippine Islands	9,000	186,100
Porto Rico	30	600
South Carolina	169	3,500
South Dakota	331,363	6,849,900
Tennessee	179	3,700
Texas	18	400
Utah	185,993	3,844,800
Virginia	175	3,600
Washington	18,282	377,900
Wyoming	184	3,800
Other States	5,744	118,700
Total	4,800,359	\$99,232,200

From this it will be seen that the output of gold for 1909 reached the unprecedented value

of \$99,232,200, an estimated increase of \$4,672,-200 over the value of the product of 1908. Although the gold mining industry was generally progressive in 1909 the increased production resulted chiefly from operations in six States and territories and the preliminary figures of the Director of the Mint would indicate a decrease in actual production from fourteen others. The most notable increase in production was that in Nevada, where the preliminary figures indicate a gain of \$3,219,000, and where mining was active, particularly at Goldfield and Tonopah. The next largest increase, \$1,941,600, is indicated in California, where lode mining has been continuously productive and where dredging for gold has been of growing importance. For Alaska an increase of \$1,088,800 is indicated, and Montana and Arizona show gains in production, partly due to the greatly increased copper output. On the other hand, a decrease of \$916,300 is indicated at Colorado, chiefly at Cripple Creek, where the production will not greatly increase until the completion of the Roosevelt deep drainage tunnel. A decrease of \$892,300 is shown in South Dakota, where the great Homestake mine was closed from November 23, 1909, owing to labor troubles.

According to estimates from the United States Bureau of Statistics the United States imported in 1909 gold valued at \$13,510,513 in foreign ore, \$28,238,368 in foreign bullion, and \$6,059,313 in foreign coin, and exported gold valued at \$498,822 in domestic ore, \$43,021,545 in domestic bullion, \$86,803,265 in United States coin and \$2,717,725 in foreign coin, the excess of exports over imports thus being \$87,-238,323. In 1908 there was an excess of exports over imports valued at \$30,939,163. The imports in 1909 were made up chiefly of ore and bullion from Mexico and to a smaller degree from Canada and South America. The exports consisted largely of coin, and went chiefly to South America, though large amounts of gold were sent to Japan, the United Kingdom and France.

WORLD PRODUCTION. The gold production of the world, as estimated by the *Engineering and Mining Journal* at the close of 1909, was in that year \$457,567,280. The table given below shows the world's production in 1908-9 from various countries according to figures of the same authority.

GOLD PRODUCTION OF THE WORLD IN DOLLARS

Country	1908	1909
Transvaal	\$145,819,016	\$151,900,000
United States	94,560,000	96,500,000
Australia	73,314,671	71,980,780
Russia	30,944,561	34,160,000
Mexico	24,518,548	26,000,000
Rhodesia	12,276,394	12,605,000
British India	10,424,067	10,566,500
Canada	9,559,274	10,750,000
China, Japan and Korea	10,618,850	11,000,000
West Africa	5,773,544	4,625,000
Madagascar	1,136,850	2,480,000
Other countries	24,488,752	25,000,000
Total	\$443,434,527	\$457,567,280

It will be noted that the estimates for the United States are considerably smaller than the estimates made by the Director of the Mint in the table above. The total increase in the world's production in 1909 as compared with

1908 was \$14,132,753, or 3.2. The larger gains came from the Transvaal, Russia and Mexico. Australia alone of the prominent producing countries showed a decreased output.

GOLD COAST. A British Crown colony and protectorate on the western coast of Africa, with a coast line of about 350 miles and an inland extension of about 440. Area, including Ashanti and the Northern Territories, estimated at 119,260 square miles. Population (1906), 1,696,965; of the colony, 895,350. The European population in 1908 is given at 1768. The natives are nearly all pagans, but Mohammedanism and Christianity are on the increase. Accra, the administrative centre, has 17,892 inhabitants. There are government and mission schools. The native State of Ashanti, lying inland, is administered by a chief commissioner (capital, Kumasi; population 6642). The territories north of Ashanti in the hinterland, a separate district under a commissioner, are known as the Northern Territories. The soil of the entire country is extremely fertile. Rubber, cacao, timber, palm-oil and palm-kernels are the staple products. Gold is found in considerable quantities. The total imports and exports in 1907 were £2,366,195 (Great Britain, £1,758,315) and £2,641,674 (Great Britain, £1,954,626) respectively; in 1908, £2,029,446 (Great Britain, £1,476,130) and £2,525,170 (Great Britain, £1,952,395). The principal articles of import were textiles, spirits and hardware; of exports (1908), gold, £1,151,944; cacao, £540,821; rubber, £168,144; palm-oil, £129,535; palm-kernels, £77,821. The government railway from Sekondi through Tarkwa, the centre of the gold mining industry, to Kumasi (168 miles), is completed and open to traffic. Another railway from Accra into the interior is under construction. There are 1280 miles of telegraph line and 46 offices. The total revenue and expenditure for 1908 were £752,141 and £392,072 respectively, against £708,718 and £617,124 in 1907. The colony is administered by a governor (in 1909, Sir J. P. Rodger), who is also governor in Ashanti, which, however, is not under the laws and ordinances of the Gold Coast. The governor is assisted by an executive and a legislative council.

GOLF. The national championship tournament in 1909 was won by R. A. Gardner, who defeated H. Chandler Egan 4 up and 2 to play at Wheaton, Ill. Miss Dorothy Campbell, of North Berwick, Scotland, won the woman's championship, the runner up being Mrs. R. H. Barlow. The fifteenth annual open championship tournament of the United States Association was held over the Englewood, N. J., course and resulted in a victory for George Sargent, who covered the course in 290, a new record. Thomas McNamara finished second and Alexander Smith third. Other prominent tournaments held in the United States during the year, and the winners in each total: New Jersey, State, Max Behr; Metropolitan Open, Alexander Smith; Western Open, W. Anderson; Western Amateur, Charles Evans, Jr.; Middle Atlantic States, J. Davidson, and Eastern Professional, Alexander Smith.

Jerome D. Travers, the national champion in 1908, entered the English Amateur Championship tournament at Muirfield, England, but failed to reach the finals. T. J. Stevenson, another American, met a like fate. The tourna-

ment was won by Robert Maxwell. The English Open Championship went to J. H. Taylor, who also won the French Open Championship by defeating J. Braid by 1 up. The English woman's championship was won by Miss Dorothy Campbell, who also won the American woman's championship. Miss Campbell, however, lost the Scotch woman's championship to Miss E. Kyle.

The Intercollegiate Golf Association Team Championship again went to Yale, which team defeated Harvard in the final match over the Awamis course. The individual championship was won by A. Seckel, of Princeton, who defeated H. Legg, of Yale, 6 up and 4 to play. In England, Oxford defeated Cambridge 6 matches to 2.

GOMEZ, José MIGUEL, President of Cuba. See CUBA.

GOODIE, JOHN. An American lawyer, public official and writer, died July 14, 1909. He was born in Bedford county, Va., in 1829, and graduated from Emory and Henry College in 1848. He studied law and was admitted to the bar in 1851. In the same year he took a seat in the Virginia House of Delegates. He was one of the most ardent advocates of secession, and was elected the representative of Virginia to the Confederate Congress. He served in the Civil War as a volunteer. After the war he was a member of the Democratic conventions of 1868 and 1872. He was appointed a member of the joint American and Chilean claims commission by President Cleveland. From May, 1885, to August, 1886, he was Solicitor-General of the United States. He wrote *Recollections of a Lifetime*, and a series of articles on Confederate leaders. As an orator he was widely known throughout the South.

GOODRICH, CASPAR FREDERICK. An American rear-admiral, retired from active service in April, 1909. He was born in Philadelphia in 1847, and graduated from the United States Naval Academy in 1864. He served in the Civil War in 1864-5. In 1869 he was made lieutenant-commander, in 1884 commander, and in 1897 captain. During the Spanish-American War he commanded the *St. Louis* and the *Newark*. In 1903-4 he was commandant of the Navy Yard at Portsmouth, and in 1905-6 commanded the Pacific Squadron. On June 1, 1907, he was made commandant of the New York Navy Yard, which position he held on his retirement. He was made rear-admiral in 1904.

GOODSELL, DANIEL AYRES. An American bishop of the Methodist Episcopal Church, died December 5, 1909. He was born at Newburg, N. Y., in 1840, and graduated from the University of the City of New York in 1859. In the same year he entered the ministry of the Methodist Episcopal Church. From 1880 to 1888 he was literary editor of the *Christian Advocate*. In the latter year he became Secretary of the Board of Education of the Methodist Episcopal Church and was made a bishop. In his official capacity he visited China, Japan, Korea, Italy, Bulgaria, Switzerland, Germany, Scandinavia, and Finland. He was one of the two editors of the *Discipline* of the Methodist Church. He was at one time pastor of the New York Avenue Methodist Episcopal Church, Brooklyn, and had parishes in New Haven and Meriden, Conn. He was appointed Resident Bishop in Boston, and in 1908 was made Resi-

dent Bishop in the Methodist Episcopal Church, New York City. He was chairman of the commission which produced the Hymnal now in use in the Methodist Church. Bishop Goodsell wrote on scientific as well as religious matters. He left a fine collection of marine fossils and geological specimens. Among his published works are *Nature and Character at Granite Bay* (1901); and *Things Which Remain* (1904). He contributed also to reviews and periodicals.

GORDIN, JACOB M. A Hebrew playwright, died June 11, 1909. He was born in the province of Poltava, Russia, in 1853. He taught school in his native country and then became a writer for a Russian paper in Odessa. His editorials attracted wide notice, and his political influence became considerable. He founded a society called the Bible Brotherhood, which was more ethical than political, but in 1891, when the press censorship became more rigid, Gordin was compelled to leave Russia. He arrived in New York, ignorant of English or of Yiddish, but he soon became proficient in the latter language, and began to write plays for the Yiddish theatres. He wrote over 100 of these, some of them possessing strong dramatic qualities. He also introduced the plays of Ibsen, Gorky, Sudermann and Hauptmann to the East Side of New York. His *Kreutzer Sonata* was translated into English, and was produced in the United States and England. Among his other plays are *The Unknown*, *Homeless*, *Democratic Americans*, *The Truth, God, Man and the Devil*, and *True Power*. Gordin took an active part in the efforts to better the conditions among the poorer Jews in New York, and was one of the founders of the Educational Alliance.
